In the year 1589 he married Anne, daughter of Frederic, king of Denmark, and as contrary winds prevented her coming to Scotland, he went to fetch her, and having conſummated the marriage, he paſſed the winter in a ſeries of feaſting and amuſements at Copenhagen. On his return he was frequently in danger from conſpiracies againſt his life, particularly from thoſe excited by the earl of Bothwell. In the year 1600, while the country was in a ſtate of unuſual tranquillity, a very extraordinary event took place, the nature and cauſes of which were never diſcovered. While the king was upon a hunting excurſion, he was accoſted by the brother of Ruthven, earl of Gowrie, who, by a feigned tale, induced him and a ſmall train to ride to the earl's houſe at Perth. Here he was led to a remote chamber on pretence of having a ſecret communicated to him, where he found a man in complete armour, and a dagger was put to his breaſt by Ruthven, with threats of immediate death. His attendants were alarmed and came to his relief; in the end Gowrie and his brother were ſlain, and the king eſcaped unhurt. As Elizabeth advanced in age, the Engliſh nation began to look with more confidence to James as their future king, and many perſons of conſequence held a ſecret correſpondence with him on the ſubject. In 1603, on the death of the queen, James was proclaimed her ſucceſſor. He took an affectionate leave of his countrymen, and proceeded, amidſt the acclamations of his new ſubjects, to London. One of his firſt acts was to beſtow a profuſion of honours and titles upon the great men, as well of his own country as thoſe of England. Within a very ſhort period, and at a time of apparent general tranquillity, a conſpiracy was diſcovered for ſubverting the government and raiſing to the throne Arabella Stuart, a near relation of the king's, by the family of Lenox, and deſcended equally from Henry VII. "Every thing," ſays Hume, "remains ſtill myſterious in this conſpiracy, and hiſtory can give us no clue to unravel it." The principal actors in it were lord Grey, a Puritan; lord Cobham, a thoughtleſs man, of no fixed principle; and ſir Walter Raleigh, a philoſopher, and ſuppoſed to be a freethinker. What cement could unite men of ſuch diſcordant principles in ſo dangerous a combination; what end they propoſed, or what means they had proportioned to an undertaking of this nature, have never yet been explained, and cannot eaſily be imagined. A conference held at Hampton-court in 1604, between the divines of the eſtabliſhed church and the Puritans, afforded James a good opportunity of exhibiting his ſkill in theological controverſy, and the ill will he bore to popular ſchemes of church-government. Although the king had diſtinguiſhed himſelf in his own country by lenity to the Roman Catholics, yet thoſe of that religion in England were ſo much diſappointed in their expectations of his favonr, that a moſt atrocious plot was formed by the zealots of that party to blow up the houſe of lords at the firſt meeting of parliament, and with it the king, queen, and prince of Wales, and all the principal nobility and gentry of the kingdom, and then to ſet upon the throne the young princeſs Elizabeth, and eſtabliſh the Catholic religion. This plot was fortunately diſcovered on the eve of the deſigned execution, and the principal perſons in it ſuffered the puniſhment due to their crimes. In 1611 he remonſtrated with the Dutch ſtates, on account of their permitting Armenius Vorſtius to hold a profeſſorſhip in one of their univerſities. He was deemed by James a heretic, and he carried his point in getting him removed. His next object was to reduce Ireland to a ſettled form of law and government. In 1612 a putrid fever carried off his ſon Henry, a prince who was, on account of his many promiſing virtues, the hope and darling of the nation: and in the following year the princeſs Elizabeth was married to Frederic, elector palatine.

We do not pretend in theſe biographical ſketches to enter into the minutiæ of each reign, nor to record all the tranſactions that relate to the prince himſelf, but we muſt not omit to mention the odium which James brought on himſelf by patroniſing his favourite Robert Carr, who, in proſecution of his laſcivious deſigns, was guilty of the moſt atrocious acts. No circumſtance, however, in James's reign was more unpopular than his treatment of the celebrated ſir Walter Raleigh; after the detection of the conſpiracy already referred to, he was tried and capitally convicted, but being reprieved, he was kept thirteen years in priſon. In 1615 he obtained by bribery his releaſe from priſon, but the king would not grant him a pardon. He went out on an expedition with the ſentence of death hanging over his head; he was unſucceſsful in his object, and on his return the brutal king ordered him to be executed on his former ſentence. (See Raleigh.) James is ſuppoſed to have been more influenced to this deed by the court of Spain than by any regard to juſtice. The influence of that court on James appeared ſoon after in his negociations for marrying his ſon prince Charles to the infanta. The object was, however, not attained, and he afterwards married him to the French princeſs Henrietta, with the diſgraceful ſtipulation, that the children of that marriage ſhould be educated by their mother, a bigotted papiſt, till they were thirteen years of age. As he advanced in years he was diſquieted by a concurrence of untoward circumſtances. The diſſentions of his parliament were very violent, and the affairs of his ſon-in-law, the elector palatine, now king of Hungary, alſo were in a very diſaſtrous ſtate. He had undertaken the cauſe of the Proteſtants of Germany, but inſtead of being the arbiter in the cauſe of others, he was ſtripped of his own dominions. In his defence, James declared war againſt the king of Spain and the emperor, and ſent troops over to Holland to act in conjunction with prince Maurice for the recovery of the palatinate; but from miſmanagement, the greater part of them periſhed by ſickneſs, and the whole enterpriſe was defeated. Oppreſſed with grief for the failure of his plans, the king was ſeized with an intermitting fever, of which he died in March 1625. He left two children, Charles, his ſucceſſor, and Elizabeth, the wife of Frederic. It would be difficult, ſays Hume, to find a reign leſs illuſtrious, yet more unſpotted and unblemiſhed, than that of James in both kingdoms. James poſſeſſed many virtues, but ſcarcely any of them pure or free from the contagion of neighbouring vices. His learning degenerated into pedantry and prejudice, his generoſity into profuſion, his good nature into pliability and unmanly fondneſs, his love of peace into puſillanimity, and his wiſdom into cunning. His intentions were juſt, but more adapted to the conduct of private life than to the government of kingdoms. He was an ecourager of learning, and was himſelf an author of no mean genius, conſidering the times in which he lived. His chief works were "Baſilicon Doron:" and "The true Law of free Monarchies;" but he is more known for his adherence to witchcraft and demoniacal poſſeſſions in his "Demonology," and for his "Counterblaſt to Tobacco." Hume's Hiſt. Robertſon's Hiſt. of Scotland.

The acceſſion of James to the crown occaſioned no immediate benefit to ſcience or refinement in the polite arts; as the country he quitted was ſtill leſs poliſhed than that in which he arrived. Nor does it appear that this prince, either from nature or education, was enabled to receive any pleaſure from muſic; however, early in his reign, the gentlemen of his chapel, aſſiſted by the influence and ſolicitation of ſeveral powerful noblemen, who pleaded their cauſe, ſeverally obtained an increaſe of ten pounds to their annual ſtipend.

An entry is made of this event in the cheque-book of the Chapel Royal, ſigned, not only by five of the great officers of ſtate, but by the ſubdean, chaplains, and gentlemen of the chapel then living.

Among theſe petitioners there is but one name, that of Edmund Hooper, which ever appears afterwards in the liſts of muſicians eminent for compoſition or performance, except Bird, Bull, and Gyles, who had diſtinguiſhed themſelves in the preceding reign.

Anthems, maſques, madrigals, ſongs, and catches, ſeem to compriſe the whole of our vocal muſic for the church, the ſtage, and the chamber, at this time. And with reſpect to inſtrumental productions under the title of "Fancies, &c." as they were chiefly compoſed for lutes and viols, which are now laid aſide, if they had been replete with genius and learning, juſtice could not have been done to them in the performance. Luckily the chief part of them are of ſo artleſs and inſipid a kind, that no loſs would accrue to judicious and reaſonable lovers of muſic by their utter annihilation.

Elway Bevin and Orlando Gibbons were the beſt, and almoſt the only good compoſers during the reign of James I. if we except thoſe which the reign of queen Elizabeth had produced, and who embelliſhed during a few years her ſucceſſor's reign. See Bevin, and Orlando Gibbons.

James II. king of England, and the VIIth of Scotland, ſecond ſon of Charles I. by Henrietta of France, was born in October 1633, and immediately declared duke of York. (See Charles I. and II.) After the capture of Oxford by the parliament army in 1646, he was carried to London, and placed under the care of the duke of Northumberland, but in 1648 he contrived to make his eſcape, and in the following year joined his mother at Paris. At the age of twenty he ſerved in the French army under the celebrated Turenne, and acquired a great reputation. He afterwards entered into the Spaniſh army in Flanders, under the prince of Condè, and thus he advantageouſly paſſed his exile in acquiring military experience, and the reputation of ſpirit and proweſs ſuited to his birth. At the reſtoration of his brother, James took the command of the fleet as high-admiral; and he was married to Anne Hyde, daughter of lord Clarendon. (See Hyde.) Maritime and commercial affairs engaged the duke's attention, and he was at the head of an African company, when, in 1664, he took a part in promoting a Dutch war for the ſuppoſed intereſts of trade. He had been made commander-in-chief of a powerful fleet, and obtained a ſignal victory over the Dutch under admiral Opdam. Opdam's own ſhip was blown up in the action, and nineteen of his fleet were ſunk or taken, with the loſs of a ſingle veſſel on the part of the Engliſh. The duke was in the thickeſt of the fight, and three of his friends, men of high rank, were killed by his ſide. The conduct of Brounker, his gentleman of the bed-chamber, brought ſuſpicion on the duke. Without the knowledge of his maſter, and while he was aſleep, this man gave orders to ſlacken ſail, though in purſuit of the enemy; but as he was not puniſhed for his orders, nor even diſmiſſed from his office till the matter was agitated in the houſe, the duke himſelf was accuſed by his enemies of being privy to the orders iſſued by his ſervant. After this he had no farther ſhare in the naval actions of that war. In 1671 the ducheſs of York died, leaving two daughters, Mary and Anne, who came to be ſucceſſively queens of England. Before her deceaſe ſhe openly declared herſelf a convert to the Roman Catholic religion, which had been ſecretly that of the duke many years, and was now openly avowed by him. In the Dutch war of 1672, the duke of York was again placed at the head of the fleet, a furious engagement enſued, in which the earl of Landwick, who was ſecond in command, was blown up, and the duke's own ſhip was ſo much ſhattered, that he was obliged to ſhift his flag to another. At length the Dutch retired, and were not purſued, the loſs being nearly equal on both ſides. By an act of parliament, papiſts were now excluded from all public employments, and the duke was obliged to reſign his command. (See Test *Act*.) After this he uſed every endeavour to introduce the Catholic religion into England. In 1677 the duke's eldeſt daughter, Mary, was married to the prince of Orange, an alliance which gave univerſal ſatisfaction to the nation. Both Mary and Anne had been brought up in Proteſtant principles, to which they ſtedfaſtly adhered. During the proceedings occaſioned by the ſuppoſed Popiſh plot, the duke of York, in 1679, by his brother's advice, withdrew to Bruſſels. A bill was afterwards brought in and carried through the houſe of commons to exclude the duke from the ſucceſſion to the throne; it was, however, rejected by the lords. In 1681 he was ſent to Scotland to hold a parliament as king's commiſſioner; but his conduct on this occaſion expoſed him to the imputation of cold unrelenting tyranny, and the manner in which he treated the remnant of the covenanters was cruel in the extreme. Having returned to London, he ſet out for Scotland a ſecond time, but the frigate in which he embarked ſtruck upon a ſand-bank off the coaſt and was loſt. The duke eſcaped in a barge, and is ſaid to have ſhewn more anxiety to ſave his dogs and his prieſts, than ſeveral perſons of quality who were with him, and who were left to periſh. Among thoſe who were preſerved on this occaſion was Churchill, afterwards the illuſtrious duke of Marlborough, at that period one of the duke's favourites. During the remainder of Charles's reign, the duke had much influence in government, and was forward in promoting all the ſevere meaſures which were acted at that period. More than once the king felt himſelf called on to check his impetuous rigour, warning him of the probable conſequences of ſuch raſhneſs. "Brother," ſaid he on a particular occaſion, "I am too old to go again on my travels; you may if you chooſe it." At this time the king was meditating ſome important changes in public meaſures; he had formed the plan of a new adminiſtration, reſolved to diſmiſs thoſe ſervants who were hated by the people, and to throw himſelf entirely on the good will and affections of his ſubjects; but amidſt theſe truly wiſe and virtuous deſigns, he was ſeized with a fit, which carried him off in a few days, leaving his brother in poſſeſſion of the crown and kingdom. From the moment of his ſucceſſion to the throne, James ſeems to have purſued with ſteady determination two objects, *viz.* of rendering himſelf abſolute, and of introducing the Roman Catholic religion into his dominions. He began his career in government by going openly, with the enſigns of his dignity, to maſs, though at that time it was an illegal meeting. He alſo ſhewed an intention of carrying the prerogatives of the crown as high as poſſible, and beyond the true conſtitutional limits. A rebellion, excited in favour of the duke of Monmouth, the late king's natural ſon, ſhewed the temper of James in its true light. The ſtability of his throne would have been ſtrengthened by the ſuppreſſion of this rebellion, had not the ſeverity of his meaſures produced a hatred which was greater than the terror which it inſpired. Monmouth paid his life as the penalty of his futile attempt. Of his followers many were put to death on the field, when they had no means of reſiſtance in their power, and not a few ſuffered in cold blood by martial law with circumſtances of ſavage brutality. As if not ſatisfied with the ferocity of his ſoldiery, James called to his aſſiſtance, in the bloody work, the more ferocious and ſuperlatively cruel Jefferies, whoſe name has been unanimouſly conſigned to perpetual infamy. This judge was ſent down with a ſpecial commiſſion, in the exerciſe of which he diſplayed the moſt brutal and unrelenting rigour, and filled the towns of the weſtern parts of our iſland with mourning and conſternation. James declared his approbation of Jefferies' proceedings, by raiſing him on his return to the peerage and the chancellorſhip. (See Jefferies.) Theſe meaſures ſtruck the nation with terror, and the king was allowed to follow his own courſe without oppoſition from the people or parliament. All idea of reſiſtance to arbitrary power might have been loſt, had not James purſued with impolitic haſte his deſigns of introducing popery, which excited all the religious zeal of the general body of Proteſtants, and brought their united force into action. He hoped to lull their apprehenſions by a declaration in favour of liberty of conſcience, but they ſoon ſaw that this was intended ultimately for the benefit of the Catholics only. He attacked the eſtabliſhed church, and appointed a commiſſion, which cited before it all clergymen who had done any thing to diſpleaſe the court. The rights of the univerſities were invaded, and in particular, a mandate was iſſued to Magdalen college, Oxford, commanding the election of a man as preſident, who had ſhewn a diſpoſition to become a Catholic. The king next publiſhed a declaration of indulgence in matters of religion, which was ordered to be read by the clergy in all the churches in the kingdom. Seven biſhops met and drew up a humble and very loyal petition againſt this ordinance. For this act they were committed to the Tower, proſecuted for ſedition, and brought to a ſolemn trial, but no efforts of the court could procure a verdict againſt them; they were acquitted, and the jury who pronounced them "Not Guilty," were hailed as the ſaviours of the country. The general rejoicing on this occaſion extended to the regiments encamped at Hounſlow, and indeed to almoſt the whole of the army. James had already ſent an embaſſy to Rome, in order to reconcile his kingdom to the holy ſee, and the birth of a ſon and heir at this time ſupported his confidence, but ſo unpopular was he become, that a general perſuaſion prevailed that a ſuppoſititious child was obtruded on the nation. The dangers which now threatened the liberties and religion of the country produced an union of parties, and many of the nobility and gentry concurred in an application to the prince of Orange, ſtadtholder of the United Provinces, and the king's ſon-in-law for aſſiſtance. William liſtened to the prayer of their petitions, and prepared with great ſecrecy a fleet and an army for the invaſion of the country. James was now ſenſible of his errors, and would gladly have retrod his ſteps, but it was too late. All confidence between him and the people was at an end, and his conceſſions were regarded as tokens of fear, not as evidences of contrition. The prince arrived in ſafety at Torbay, and landed on the 4th of November, 1688. The royal army began to deſert by whole companies and even regiments; and the king, deſerted by his ſubjects, and having for his opponent his own ſon-in-law, found it adviſable to retire. His beſt friends, as he thought them, abandoned his cauſe; and his daughter Anne, married to prince George of Denmark, put herſelf into the hands of the inſurgents. When news of this fact was brought to him, he exclaimed in an agony of grief, "God help me! my own children have forſaken me." He now ſought for ſafety in a foreign country, leaving the public affairs in the greateſt confuſion. He repaired to St. Germains, where he was received with the greateſt kindneſs and hoſpitality by the French king Louis XIV. (See William.) In the following year, James was enabled by the monarch of France to make a trial for the recovery of Ireland, where the Catholics poſſeſſed the chief power. He ſoon became maſter of the whole iſland, excepting part of the north. He failed in the ſiege of Londonderry, and returning to Dublin held a parliament. He ſoon renewed the moſt violent meaſures againſt the Proteſtants, which ſhewed that his diſpoſition, and the principles on which he meant to govern, had undergone no radical change. At length William, who had been appointed his ſucceſſor, landed with an army in Ireland, and the deciſive battle of Boyne was fought in June 1690. In this action, ſo important to his intereſt, James kept aloof, and when the fortune of the day went againſt him, he returned to France. All his other attempts at reſtoration to the crown of theſe realms were futile, and he ſpent the latter years of his life in the practice of devotion. He died at St. Germains in September 1701. His ſon James, commonly known under the title of "The Pretender," died at Rome in 1766; his ſon Charles Edward, who invaded Scotland in 1745, died in 1788, and Henry Benedict, cardinal of York, who for ſome years was ſupported by this country, is now dead, and he was the laſt ſurviving branch of this unfortunate race. Hume. Rapin.

James was too gloomy and bigotted a prince, during the latter part of his life, to have ſpirit or leiſure for cultivating or encouraging the liberal arts; nor, indeed, does he ſeem to have revolved any other idea in his mind, than the romantic or impracticable plan of converting his three kingdoms to the Catholic faith. And his ſubjects ſeem to have been in ſuch a ferment during his ſhort reign, that nothing, which deſerves to be recorded, was atchieved by any of them, except the wreſting from him that power he abuſed, This remark is not made without recollecting that Newton publiſhed his Principia, and Locke finiſhed his "Eſſay on Human Underſtanding," while this prince ſat on the throne; but it can never be imagined that during ſo ſhort and turbulent a reign, two works which exalt human nature more perhaps than any which the longeſt reigns upon record ever produced, could have been brought to maturity. Indeed, Purcell, who had ſo much diſtinguiſhed himſelf in the former reign, does not appear by the date or occaſion of his exertions, to have produced any particular anthem, ode, or drama, for the church, court, or ſtage, from the death of Charles II. his firſt royal maſter, till after the Revolution, except the anthem "Bleſſed are they that fear the Lord," which he compoſed by order of the court in 1687, as a thankſgiving for the queen's pregnancy.

James I. king of Arragon, born about the year 1207, was ſon of Peter II. who was ſlain in 1213. On the death of his father James was ſolemnly proclaimed, but his country was for ſome years the prey of diſturbances uſually incident to a people governed by a regency. This youth ſhewed early ſigns of a great and heroic mind: at the age of twelve, he put himſelf at the head of a body of troops, in order to reduce a ſubject who had raiſed the ſtandard of rebellion, and the young king returned ſucceſsful from the expedition. In 1221 he was married to the infanta Leonora of Caſtile, but in a ſhort time his uncle, Don Ferdinand, contrived to get the king and his wife into his poſſeſſion. James made his eſcape, and a ſeries of inteſtine diſorders took place till he became maſter of his kingdom, when he was about twenty years of age. He now performed many exploits which proved his valour and wiſdom, but his great object was to annex to his dominions the kingdom of Valencia, which was ſubject to the Moors, whom he had already driven from the iſland of Majorca. For this purpoſe he ſolicited a bull of cruſade from the pope Gregory IX., which was granted, but as a condition he was obliged to permit ſevere canons againſt hereſy and reading the ſcriptures to be enforced in his dominions, and the Inquiſition to be introduced into Arragon. He made himſelf maſter of Valencia, and expelled the Moors, who retired into the neighbouring kingdoms of Granada and Murcia, and into Africa. Though generally ſucceſsful in his projects of ambition, he paſſed a troubled and agitated life. In 1268, as an atonement for his repeated failings, he took the croſs and embarked for the Holy Land, but being driven by ſtorm into a port of France, he returned without accompliſhing his purpoſe. In 1276, the oppreſſed Moors broke out in open rebellion, and defeated an army ſent out againſt them. This diſaſter, which he had not contemplated, had ſuch an effect upon the mind of the king, that he fell ſick, reſigned his crown in favour of his ſon Pedro, and took the habit of a Ciſtercian monk. He died in the ſame year at the age of ſixty-nine. To his ſecond ſon James he left the kingdom of Majorca, and every thing which he poſſeſſed in France. Mod. Univ. Hiſt.

James II. king of Arragon, ſurnamed the *Juſt*, ſon of Peter III., was born in 1261. He was king of Sicily in right of his mother, at the death of his elder brother Alphonſo III. in 1291, whom he ſucceeded to the throne of Arragon. He was perſuaded to renounce his rights on Sicily, but his mother and brother Ferdinand were reſolved to hold the iſland by force. James ſet about reducing Alicant and Murcia, in which he ſucceeded, and afterwards viſited Rome, where he was urged by the pope to make war upon his brother Ferdinand in order to expel him from Sicily. After a feeble attempt for this purpoſe he gave up the cauſe from an impreſſion of its injuſtice. When the perſecution broke out againſt the knights' templars, James, unlike the other ſovereigns of Europe, refuſed to concur in ſevere meaſures againſt them, ſaying, "We muſt firſt be convinced of their guilt, and it will be then time enough to think of their puniſhment." He even protected and maintained thoſe who had been driven from other countries. In conjunction with the king of Caſtile, he made an expedition in 1308 againſt the Mooriſh king of Granada, merely on account of their religious differences. This enterprize was unſucceſsful, and both kings retreated to their own dominions. After this and another expedition againſt the pirates of Tunis, he turned his attention to improvements in his own country, and the aggrandizement of his family by matrimonial alliances. He compelled his eldeſt ſon to marry Eleonora of Caſtile. The prince, however, immediately quitted his wife, and deſired at the ſame time to renounce all right and title to the ſucceſſion of his father's kingdom, a favour which was granted him, and in the aſſembly of the ſtates he took an oath of fealty to his next brother. At the ſame aſſembly, Arragon, Catalonia and Valencia were united, and the union declared inſeparable. James died in the year 1326, greatly regretted by his ſubjects, to whom he was endeared by the equity and moderation of his meaſures. Mod. Univ. Hiſt.

James de Vitry, a celebrated French cardinal and hiſtorical writer, was born at a ſmall town near Paris, whence he took his ſurname, towards the cloſe of the 12th century. He was educated for the church, took orders, and obtained ſome preferment. This he reſigned, and became a regular canon in the monaſtery of Oignies, in the dioceſe of Namur. Hence he went to Toulouſain, where he preached a cruſade againſt the Albigenſes. After this, his zeal led him to preach up a cruſade againſt the Saracens, to aſſume the croſs, and to follow the cruſaders into the Eaſt. Here he continued many years, and was made biſhop of Ptolemais, or Acre. In 1228 pope Gregory IX., to recompenſe him for his ſervices, invited him to Rome, and raiſed him to the purple, at the ſame time giving him the biſhopric of Freſcati. He was now ſent to France, in the capacity of papal legate, to preach up a new cruſade againſt the Albigenſes, and he was afterwards ſent in the ſame capacity into Brabant and the Holy Land. He died at Rome in the year 1244. Although he was author of many works, the moſt curious, and that by which he is chiefly known, is entitled "Hiſtoriæ Orientalis et Occidentalis, Libri 3." In the firſt book we have an account of the affairs of the Eaſt, civil and eccleſiaſtical, and the hiſtory of the country from the time of Mahomet to the year 1210. In the ſecond a view of the ſtate of eccleſiaſtical affairs in the Weſt, during his own time; and in the third the hiſtory of the Eaſt to the year 1218. The cardinal was eſteemed a man of talents adapted to the various concerns in which he engaged, and he was ſteadily devoted to the intereſts of the holy ſee.

James, Thomas, a learned Engliſh divine and critic, who flouriſhed in the ſeventeenth century, was born at Newport, in the Iſle of Wight, about the year 1571. He was initiated in grammar learning at Wincheſter ſchool, and was thence ſent to New college, Oxford, of which houſe he became a fellow in 1593. In 1599, having collected many MSS. he publiſhed "Philobiblion Richardi Dunelmenſis," with an appendix, "De Manuſcriptis Oxonienſibus." This he dedicated to ſir Thomas Bodley, who afterwards appointed him to the office of keeper of the library which he was then building. In 1600, Mr. James publiſhed "Eclogæ Oxonio-Cantabrigienſes," containing a catalogue of all the MSS. in each college library at Oxford, but not thoſe in the public library, and in each college library, as well as the public one, at Cambridge. In 1605, he printed "Catalogus Librorum in Bibliotheca Bodleiana," and ſhortly after he applied himſelf to examine the ſtate of all the public libraries in England. In the year 1614 he obtained conſiderable promotions in the church without ſolicitation. In 1620 he reſigned his office as keeper of the Bodleian library, in order that he might have leſs interruption in his ſtudies, the chief object of which was the defence of the Proteſtant church againſt the Papiſts. He died at the early age of 51, leaving behind him the character of being the moſt induſtrious and indefatigable writer againſt the Papiſts of any who had been educated at Oxford ſince the Reformation. He was author of many other works beſides thoſe already mentioned; the titles of which may be found in Wood's Athen. Oxon. See alſo Biog. Brit. Supplement.

James, Richard, nephew of the preceding, was alſo a native of Newport, in the Iſle of Wight, brought up to the church, and entered into holy orders. About the year 1619 he travelled for improvement through Wales and Scotland, whence he proceeded to Shetland, Greenland, and Ruſſia; on the laſt named country he wrote obſervations, as well as on the manners and cuſtoms of the inhabitants. On his return he aſſiſted the celebrated Selden in the compoſition of his work entitled "Marmora Arundeliana," which was publiſhed in 1628. He was alſo ſerviceable to ſir Robert Cotton, and his ſon ſir Thomas, in diſpoſing and ſettling their noble library, and with the former of theſe he was committed cloſe priſoner by order of the houſe of lords in 1629. During his confinement he compoſed ſome verſes, which he prefixed to a copy of all his printed works, and preſented it to the Bodleian library, a ſhort time before his death. He died in December 1638, leaving behind him forty-five MSS. of his own compoſing or collecting, all in his own hand-writing, which were afterwards placed in the Bodleian library. He was regarded by all who knew him to be a very good Grecian, poet, critic, antiquary, and divine; and admirably well ſkilled in the Saxon and Gothic languages. He was engaged by his uncle to aſſiſt in collating the MSS. of the fathers, with the Popiſh editions, in order to detect the forgeries and omiſſions in theſe laſt. He ſeems never to have obtained any preferment in the church, though his uncle pleaded hard for him with the celebrated Uſher. In a letter to this archbiſhop, having mentioned our author's engagement in writing the life of Becket, he recommends him to the prelate in theſe words: "This kinſman of mine, as well as myſelf, ſhould be right glad to do any ſervice to your lordſhip in this kind. He is of ſtrength, and well both able and learned to effectuate ſomewhat in this kind, critically ſeen both in Hebrew, Greek, and Latin, knowing well the languages, both French, Spaniſh, and Italian; immenſe beyond all other men in reading of the MSS.; of an extraordinary ſtile in penning; ſuch a one as I dare balance with any prieſt or Jeſuit in the world of his age, and ſuch a one as I could wiſh your lordſhip had about you, but "paupertas inimica bonis eſt moribus," and both fatherleſs and motherleſs, and almoſt, but for myſelf, I may ſay, (the more is his pity) friendleſs." Biog. Brit.

James *of the Sword, St., San Jago del Eſpada*, a military order in Spain, the moſt honourable and opulent of the three Spaniſh orders, inſtituted in 1170, under the reign of Ferdinand II. king of Leon and Gallicia. The other two orders, *viz.* thoſe of Calatrava and Alcantara, though inferior to that of St. Jago in power and wealth, were nevertheleſs very conſiderable.

Its end was, to put a ſtop to the incurſions of the Moors; theſe knights obliging themſelves by a vow to ſecure the roads, and to defend the pilgrims on their journey to viſit the relics of St. James of Compoſtella.

An union was propoſed and agreed to in 1170 between theſe and the canons of St. Eloy; and the order was confirmed by the pope in 1176. At that time a conſiderable part of Spain was ſubject to the Moors, and the whole country much expoſed to the depredations not only of the enemy, but of banditti. It is no wonder then, that an inſtitution, the object of which was to oppoſe the enemies of the Chriſtian faith, and to reſtrain and puniſh thoſe who diſturbed the public peace, ſhould be extremely popular, and meet with general encouragement.

The higheſt dignity in this order is that of grand-maſter, which has been united to the crown of Spain. The knights are obliged to make proof of their deſcent from families that have been noble for four generations on both ſides; they muſt alſo make it appear, that their ſaid anceſtors have neither been Jews, Saracens, nor heretics; nor even to have been called in queſtion by the inquiſition.

The novices were obliged to ſerve ſix months in the galleys, and to live a month in a monaſtery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permiſſion to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, ſince the year 1652, they have added that of defending the immaculate conception of the Holy Virgin. The badge of the order is a croſs of gold, enamelled crimſon, charged on the centre with an eſcallop ſhell argent, and worn round the neck pendant to a broad green ribband. Their habit is a white cloak, with a red croſs on the breaſt. This is eſteemed the moſt conſiderable of all the military orders in Spain: the king carefully preſerves the office of grand-maſter in his own family; on account of the rich revenues and offices whereof it gives him the diſpoſal. The number of knights is much greater now than formerly, all the grandees chooſing rather to be received into this than into the order of the Golden Fleece; inaſmuch as this puts them in a fair way of attaining to commands, and gives them many conſiderable privileges in all the provinces of Spain, but eſpecially in Catalonia. The knights are moſt implicitly to obey the commands of their grand maſter. The order could formerly bring into the field 1000 men at arms; and if they were accompanied as was uſual in a former age, this was a formidable body of cavalry. To this order there belonged 84 commanderies and 200 priories, and other benefices.

There was an order of the ſame name and kind inſtituted in Portugal by king Don Denys, ſurnamed the Liberal, who, in the year 1288, obtained a bull from pope Nicholas IV. for the ſeparation of the order from Spain; and in the year 1486, pope Alexander VI., at the ſolicitation of John II., revoked the vows of celibacy, and allowed all the knights of this order in Portugal to marry. The reigning king of Portugal is grand maſter of the order. The badge and ribband are nearly the ſame with thoſe of the Spaniſh order.

Another order under the ſame denomination, being a religious order for ladies, was inſtituted at Salamanca, in Spain, in the year 1312. Their habit was black, their badge, which they wore on the left breaſt, was a croſs fleury fitché embroidered gules, charged on the centre with an eſcallop or.

JAMES, *St.*, *Order of*, was inſtituted in Holland in the year 1290, by Florence V. count of Holland. The knights were 12 in number. The collar of the order was a chain of gold, in which, at equal diſtances, were placed ſix eſcallop ſhells; and pendant to this collar was a medal of gold with the image of St. James enamelled upon it.

JAMES's *Day*, *St.*, a feſtival in the calendar, obſerved on the 25th of July, in honour of St. James.

JAMES's *Bay*, in *Geography*, the eaſtern part of the ſouth diviſion of Hudſon's bay, with which it communicates, dividing New Britain from South Wales. It is about 150 miles wide. N. lat. 51° 10′ to 55° 10′. W. long. 58° 30′ to 82° 45′. See HUDSON's *Bay*.

JAMES's *Cape*, *St.*, the ſouthernmoſt extremity of Queen Charlotte's iſland, diſcovered by captain Dixon in 1787, on the 25th of July, whence its name. Captain Vancouver fixes its ſituation in N. lat. 51° 58′. E. long. 229° 6′.—Alſo, a cape on the coaſt of Chiampa, in the Chineſe ſea. N. lat. 10° 32′. E. long. 106° 43′.

JAMES *City*, a county of Virginia, in the United States, 30 miles long and 12 broad, lying between Chickahominy and James's rivers, containing 1542 free inhabitants, and 2318 ſlaves.

JAMES *Fort*, a fort of the iſland of Barbadoes, near Bridge-town.—Alſo, a fortreſs of Africa, in the kingdom of Acra, on the Gold coaſt.—Alſo, a fort on the N. ſide of Loblollo bay, in the iſland of Antigua, at the head of which is St. John's harbour.

JAMES *Iſland*, an iſland of America, ſituated in South Carolina, on the ſouth ſide of Charleſtown harbour, oppoſite to Charleſtown, and containing about 50 families; ſeparated from John's iſland on the weſtward by Stono river.—Alſo, an iſland of Africa, 30 miles up the river Gambia, where the Engliſh have a fort and factory.—Alſo, a ſmall iſland near the coaſt of Maryland, in the Cheſapeak. N. lat. 38° 40′. W. long. 76° 25′.

JAMES *River*, a navigable river of America, in Virginia, anciently called by the Indians "Powbatan," formed by the junction of Jackſon's and Cowpaſture rivers, which are nearly equal. At the place where it begins to break through the Blue ridge it receives the North river, and in its courſe between the Blue ridge and Richmond receives ſeveral other ſtreams. At Richmond the navigation is interrupted by falls; but a canal ſerves for the paſſing of boats by theſe falls. Above theſe the river is navigable for batteaux and canoes to within 10 miles of the Blue ridge. It is not improbable that its navigation may at ſome future period be made to interlock with that of the Potowmac, and thus to communicate by a ſhort paſſage with the Ohio. James river, after a courſe of between 200 and 300 miles, falls into the mouth of the Cheſapeak. N. lat. 37° 2′. W. long. 76° 20′.

JAMES, a creek in Delaware, which empties into Delaware bay, 11 miles below Hook iſland. Dover, the ſeat of government, ſtands on this creek, 5 miles from its mouth.

JAMES, *St.* a town of South Carolina; 15 miles N. of Charleſtown. Alſo, a town of South Carolina, on the S. ſide of the Santée; 44 miles N. of Charleſtown. N. lat. 33° 29′. W. 79° 28′.—Alſo, a town of the ſtate of Maryland, in Kent county, 4 miles S.W. of Cheſter.—Alſo, a town of France, in the department of the Channel, and chief place of a canton in the diſtrict of Avranches; 9 miles S. of it. The place contains 2522, and the canton 12,459 inhabitants, on a territory of 155 kiliometres, in 12 communes.

JAMES's *Iſlands*, *St.*, the greater and leſs, two of the ſmaller Virgin iſles, ſituated in the King's channel E. of Tortola, and W. of St. Thomas; between which and them is St. James's paſſage.

JAMES's *River*, *St.*, a river of Canada, which runs into the river St. Lawrence, N. lat. 48° 10′. W. long. 69° 10′.

JAMES's *Powder*, in the *Materia Medica*, a famous preparation of antimony, the receipt for which, as extracted from the records of chancery, is as follows: "Take antimony, calcine it with a continual protracted heat in a flat unglazed earthen veſſel, adding to it from time to time a ſufficient quantity of any animal oil and ſalt, well dephlogiſticated; then boil it in melted nitre for a conſiderable time, and ſeparate the powder from the nitre by diſſolving it in water: Take quickſilver, make an amalgam with equal parts of the martial regulus of antimony and pure ſilver, adding a proportional quantity of ſal ammoniac. Diſtil off the mercury by a retort into a glaſs receiver, then with the quickſilver make a freſh amalgam with the ſame ingredients; diſtil again, and repeat this operation nine or ten times; then diſſolve this mercury in ſpirits of nitre, and put it into a glaſs retort and diſtil to dryneſs; calcine the caput mortuum till it becomes of a gold colour; burn ſpirits of wine upon it, and keep it for uſe. The doſe of the powder is uncertain; in general, 30 grains of the antimonial powder and one grain of the mercurial is a moderate doſe. Signed and ſworn to by Robt. James." It is ſuggeſted, however, that James's real proceſs was formed upon one previouſly brought from Italy, which had its run in the faſhion of the day, and was called "Liſle's powder," and the preparation of which was very analogous to the preſent "Pulvis antimonialis;" for an account of which, ſee ANTIMONY.

In the 2d part of the 81ſt volume of the Philoſophical Tranſactions (for 1791) we have an elaborate paper, containing a great number and variety of "Experiments and Obſervations to inveſtigate the Compoſition of James's Powder." Theſe experiments and obſervations are the more important and uſeful, as they ſerve to explain the nature and manner of preparing this medicine, to which many phyſicians have recurred, and upon which they have principally depended for the cure of continued fevers; and more eſpecially as this patent medicine cannot be prepared by following the directions of the ſpecification in the court of Chancery. Our limits will not allow us to give a minute detail of the author's experiments; but we muſt content ourſelves with extracting ſome of the general reſults, and refer the reader for further ſatisfaction to the valuable paper itſelf. From the above experiments it appeared probable that ſuch a ſubſtance as James's powder might be made by calcining together antimony and bone-aſhes; which operation produces a powder called "Liſle's" and "Schawanberg's" fever powder; a preparation deſcribed by Schroder and other chemiſts above 150 years ago. The receipts for this preparation, ſays Dr. Pearſon, differed in the proportion of the antimony to the bone-aſhes, and in the ſtate of the bone; ſome directing bone-ſhavings to be previouſly boiled in water; others ordered them to be burnt to aſhes before calcining them with antimony; and in other preſcriptions the bone-ſhavings were directed to be burnt with the antimony. According to the receipt in the poſſeſſion of Mr. Bromfield, by which this powder was prepared above 60 years ago, and before any medicine was known by the name of James's powder, two pounds of hartſhorn-ſhavings muſt be boiled to diſſolve all the mucilage, and then being dried, be calcined with one pound of crude antimony, till the ſmell of ſulphur ceaſes, and a light grey powder is produced. The ſame preſcription was given to Mr. Wallis, about the ſame time, by Dr. John Eaton, of the College of Phyſicians, with the material addition, however, of ordering the calcined mixture to be expoſed to a great heat in a cloſe veſſel to render it *white.* Mr. Turner made this powder, about 50 years ago, by calcining together equal weights of burnt hartſhorn and antimony in an open veſſel, till all the ſulphur was driven off, and the mixture was of a light grey colour. He likewiſe was acquainted with the fact, that by a ſufficient degree of fire in a cloſe veſſel this cincritious powder turned white. Mr. Turner alſo prepared this powder with a pound and a half of hartſhorn ſhavings and a pound of antimony, as well as with ſmaller proportions of bone. Schroder preſcribes equal weights of antimony and calcined hartſhorn; and Poterius and Michaelis, as quoted by Frederic Hoffman, merely order the calcination of theſe two ſubſtances together (aſſigning no proportion) in a reverberatory fire for ſeveral days. In the London Pharmacopeia of 1788, this powder is called "Pulvis antimonialis," and it is directed to be prepared by calcining together equal weights of hartſhorn ſhavings and antimony.

From the whole of his *analytical* experiments Dr. Pearſon infers:

1. That James's powder conſiſts of phoſphoric acid, lime, and antimonial calx, with a minute quantity of calx of iron, which is conſidered to be an accidental ſubſtance.

2. That either theſe three eſſential ingredients are united with each other, forming a triple compound, or, phoſphorated lime is combined with the antimonial calx, compoſing a double compound in the proportion of about 57 parts of calx, and 43 parts of phoſphorated lime.

3. That this antimonial calx is different from any other known calx of antimony in ſeveral of its chemical qualities. About three-fourths of it are ſoluble in marine acid, and afford Algaroth powder; and the remainder is not ſoluble in this menſtruum, and is apparently vitrified.

From the author's *ſynthetic* experiments it appears, that by calcining together bone-aſhes, that is, phoſphorated lime, and antimony in a certain proportion, and afterwards expoſing the mixture to a white heat, a compound was formed conſiſting of antimonial calx and phoſphorated lime, in the ſame proportion, and poſſeſſing the ſame kind of chemical properties, as James's powder.

A powder, ſays Dr. Pearſon, ſold by F. Newbery under the title of "James's powder for horſes, horned cattle, hounds, &c." is a light clay-coloured, gritty, taſteleſs ſubſtance, in which are ſeen ſmall *ſpicula.* He ſays, it appears to me to be nothing more than James's powder for fevers, or Liſle's powder above-mentioned, made by calcining antimony and bone-aſhes together in open veſſels; becauſe, 1ſt, by expoſure to a white heat in cloſe veſſels, it turns as white as James's powder; 2dly, it diſſolves partially in nitrous acid; and the remainder diſſolves partially in marine acid. The nitrous ſolution contains phoſphoric acid and calcareous earth; and the muriatic ſolution affords Algaroth powder.

JAMESPOUR, in *Geography*, a town of Hindooſtan, in Balogiſtan; 25 miles S.W. of Dadari.

JAMESTOWN, a village of the county of Leitrim, province of Connaught, Ireland, which before the union returned two members to the houſe of commons. It is on the river Shannon, one mile from Drumſna, which is its poſt-town; three from Carrick on Shannon; and 73 N.W. from Dublin.—Alſo, a town of America, in Rhode iſland. See Cannonicat.—Alſo, a poſt town, formerly the metropolis of Virginia, and now the capital of James city county. It is the oldeſt town ſettled by the Engliſh in America. It is ſituated on a peninſula, on the N. ſide of James river, at its mouth in Cheſapeak bay, eight miles S.S.W. of Williamſburgh. N. lat. 37° 9′. W. long. 76° 50′.—Alſo, a town of Prince Edward county, in Virginia, ſituated on Appomatox river, 12 miles N.E. from the court-houſe.—Alſo, a town of the iſland of Barbadoes, founded in the latter end of the year 1624, being the firſt Engliſh ſettlement in the iſland; ſituated in St. James's pariſh, on the W. ſide of the iſland.

JAMEZ, or Yam, a town of Africa, in the kingdom of Fonia. N. lat. 12° 30′. W. long. 15° 11′.

JAMGONG, a town of Hindooſtan, in Dowlatabad; 10 miles W. of Amednagur.—Alſo, a town in the circar of Aurungabad; 15 miles E.N.E. of Aurungabad.—Alſo, a town of Bengal; 58 miles N.W. of Burdwan.

JAMJA, a town of Sweden, in the province of Blekingen; nine miles E. of Carlſcrona.

JAMLA, a town of Hindooſtan, in the circar of Banſwalch; 18 miles E. of Tandla.

JAMMING, in general, denotes the act of encloſing any object between two bodies, ſo as to render it immoveable.

In *Sea Language,* this expreſſion is applied to the ſituation of ſome running rope, when it happens to be ſqueezed by the compreſſion of the ſtanding-rigging, &c. and conſequently incapable of performing its office, by traverſing in the blocks, till it is releaſed. In this ſenſe jamming is oppoſed to rendering.

JAMNEY, in *Geography*, a town of Bohemia, in the circle of Chrudim; 17 miles N.E. of Leutmiſchl.

JAMNIA, Jamnes, or Jafna, in *Ancient Geography*, a maritime town of Paleſtine, between Azotus and Joppa, which belonged to the Philiſtines; but taken from them by Uzziah, king of Judah, 2 Chron. xxvi. 6. According to Joſephus, it was given to the tribe of Dan. It was taken by Judas Maccabæus, who burnt its port and its veſſels. In the 2d book of Maccabees, xii. 9. it is ſtated to be diſtant from Jeruſalem 240 furlongs. Steph. Byz. aſſigns it to the Phœnicians. Auguſtus gave it to Herod, and this prince transferred it to his ſiſter Salomé, who at her death bequeathed it to Livia, the wife of Auguſtus. Under the reign of Nero, it was taken by Veſpaſian, A.D. 67. After the conqueſt of Judea by Veſpaſian and Titus, an inconſiderable body of the Jews remained, when others withdrew; and collecting the ſcattered fragments of Jewiſh learning from the general wreck into a ſchool at Jafna or Jamnia, revived in this place their forms of worſhip. The rabbi Jochanan was the founder of the ſchool; and the good deſign which he began was completed, as far as the ſtate of the times would allow, by the rabbi Gamaliel, called from this circumſtance Gamaliel Jafnienſis. The ſucceſs which attended this ſchool induced many of the diſperſed Jews to return to Paleſtine; and another ſchool was formed at Tiberias.

JAMNITZ, or Gemnice, in *Geography*, a town of Moravia, in the circle of Znaym; 22 miles N.W. of Znaym. N. lat. 48° 59′. E. long. 15° 28′.

JAMOORGONG, a town of Hindooſtan, in the circar of Aurungabad; 20 miles E. of Jaffierabad.

JAMPNUM, in our *Old Writers*, furze, or gorſe, and gorſy ground. This word is uſed in fines of lands, &c. and ſeems to come from the French *jaune*, i. e. *yellow;* becauſe the bloſſoms of furze or gorſe are of that colour. 1 Croke 179.

JAMPOLI, in *Ancient Geography*, a town of Greece, in Livadia.

JAMPOUR, in *Geography*, a town of Hindooſtan, in Guzerat; 17 miles N. of Radunpour.

JAMPTPOUR, a town of Hindooſtan, in Bahar; 25 miles N. of Hajypour.

JAMSA, a town of Sweden, in Tavaſtland; 56 miles N.N.E. of Tavaſthus.

JAMSIO, a town of Sweden, in the province of Blekingen; 32 miles W. of Carlſcrona.

JAMTLAND, a province of Sweden, bordering upon Norway, about 70 miles in length and 60 in breadth, annexed to the crown of Sweden by the treaty of Roſchild, in the year 1658. It is generally mountainous; on the weſtern part the rocks are craggy and the mountains high, having between them deep vallies and rapid torrents. The milk of the cows, bred in theſe paſtures, and houſed even in ſummer, furniſhes excellent butter, but they are ſupplied with beef and tallow from Norway. The eaſtern part of the province is a champaign country, watered by lakes and rivers which abound with fiſh; and the neighbouring provinces are occaſionally ſupplied with grain, chiefly barley, oats, and rye, and ſome wheat from the fertile ſpots in this diſtrict. The Jamtlanders in ſevere ſeaſons are reduced, by the ſcarcity of corn, to the neceſſity of preparing bread from the pulverized bark of trees. The iron ore of this province furniſhes employment for many perſons; and they have alſo alum quarries, ſlate, lead-ore, and other minerals, two copper-works of modern erection, and a place for making ſaltpetre. The population is inconſiderable, ſo that in moſt parts religious ſervice is performed irregularly, and at diſtant intervals. The towns are few, and in the 11 pariſhes which Jamtland contains, 46 churches have been erected: the number of chimnies in all theſe pariſhes amounts to about 717. The inhabitants derive their ſubſiſtence from agriculture, grazing, hunting, and fiſhing. With the Norwegians they carry on a conſiderable trade, ſupplying them with ſalt-pans, ſteel, and iron-ware; and a kind of leather, impenetrable by water, of which are made ſhoes, boots, and even jackets. This country, by the contributions of the peaſants, maintains a regiment of foot, or, as others ſay, of dragoons, and a troop of horſe.

JANA, a town of Japan, in the iſland of Niphon; 25 miles N. of Seoda.

Jana, among the *Romans*, a name given to Diana, or the moon.

JANAGAVA, in *Geography*, a town of Japan, in the iſland of Ximo; 20 miles S.E. of Ikua.

JANAGUR, a town of Hindooſtan, in Guzerat, on the right bank of the Puddar; 100 miles W. of Amedabad. N. lat. 23° 30′. E. long. 70° 56′.

JANAKA, a raja, according to Hindoo legends, who being childleſs, adopted a female infant found in a field by a ploughman. This child proved eventually to be an avatara, or incarnation of Lakſhmi, conſort of Viſhnu, for the purpoſe of accompanying her lord on earth in his manifeſtation in the perſon of Rama. As the daughter of Janaka ſhe is ſometimes called Janeki, but her moſt common name is Sita. See Sita.

JANAKALA, in *Geography*, a town of Sweden, in the province of Tavaſtland; 10 miles N.N.W. of Tavaſthus.

JANALAX, a town of Sweden, in the province of Savolax; 35 miles N.N.W. of Nyſlot.

JANEIRO, Rio. See Rio *Janeiro*.

JANEWAY, James, in *Biography*, an Engliſh nonconformiſt divine, was educated at Chriſt-church college, Oxford. After the Reſtoration he was deprived of his living in the church, and gladly opened a meeting-houſe at Rotherhithe, when the act of indulgence was paſſed. He died in 1674. He was author of "Heaven upon Earth;" "The Saints Encouragement to Diligence;" and "A Token for Children," which has been exceedingly popular and gone through a multitude of editions. Calamy.

JANGAGUR, in *Geography*, a town of Hindooſtan, on the Nerbuddah; 15 miles W. of Hurdah.

JANGARA, a town of Bengal; eight miles N.N.E. of Curruckpour.

JANGAS, a town of Peru, in the dioceſe of Guamanga; 15 miles E. of Lunaguana.

JANGEGUR, a town of Hindooſtan, in the circar of Ruttunpour; 18 miles S. of Ruttunpour.

JANGIPOUR, a town of Bengal; 18 miles N.N.W. of Moorſhedabad.

JANGOMA, or Yangoma, a ſmall kingdom of Aſia, in the vicinity of the Birman empire, on the north of Siam. Its extent has been variable on account of its frequent revolutions. According to the Siameſe reports, this country is governed by prieſts. The inhabitants are ſaid to be tall and well proportioned; and in this hot climate their ſole garment is a cincture of linen. The women are famed in the Eaſt for their gallantry and beauty, in which laſt quality they ſurpaſs thoſe of Pegu; and voluptuous monarchs think their harems enriched and adorned by a concubine from Jangoma. The common food of the inhabitants is rice, and the country is alſo ſaid to abound in muſk, pepper, ſilk, gold, ſilver, copper, and gum-benzoic. Little that is certain, however, is known concerning this remote country.

JANGON, a town of Aſiatic Turkey, in Caramania; 18 miles N. of Kaiſarieh.

JANGUIRA, a town of Hindooſtan, in Bahar; 13 miles W. of Boglipour.

JANGUIRABAD, a town of Hindooſtan, in the circar of Sumbul; 10 miles S.W. of Anapſheer.

JANGUIRPOUR, a ſmall circar of Bengal; W. of Dinagepour.

JANI, a town of Aſiatic Turkey, in the government of Sivas; 60 miles S.S.W. of Sivas.

JANIACOPET, a town of Hindooſtan, in Bednore; 20 miles W. of Simogu.

JANICULUS, or Janicularis *Mons*, in *Ancient Geography*, a mountain of Rome, having to the E. and S. the Tiber, to the W. the fields, to the N. the Vatican; and ſo much of it as ſtands within the city-walls is about five ſtadia in circuit. It was ſo called either from an old town of the ſame name, ſaid to have been built by Janus, or becauſe Janus dwelt and was buried there; or becauſe it was a ſort of gate (janua) to the Romans, whence they iſſued out upon the Tuſcans. The ſparkling ſands have at preſent given it the name of "Mons Aureus," and by corruption "Montorius." This eminence afforded the beſt ſituation for a full proſpect of the city; but it has been leſs inhabited than the other parts on account of the groſsneſs of the air.

It is ſtill famous for the ſepulchres of Numa, and the poet Statius. Ancus Martius encompaſſed the Janiculum with a wall; and for a communication between this place and the city, he built over the river a timber-bridge, of an extraordinary ſtructure, whoſe parts were held together without being linked with iron. The pontifices were appointed to keep up and repair the bridge.

JANIDUNI, in *Geography*, a town of European Turkey, in Beſſarabia, ſituated on the Black ſea; 40 miles W.S.W. of Otchakov.

JANIKAU, or Jankow, a town of Bohemia, in the circle of Czaſlau; ſix miles S.S.E. of Czaſlau.

JANISZKI, a town of Samogitia; 36 miles N.N.E. of Miedniki.

JANITORES, door-keepers among the Romans, the meaneſt of their ſlaves, who were commonly chained to their poſts.

JANIZARIES, an order of infantry in the Turkiſh armies; reputed the grand ſeignior's foot-guards.

Voſſius derives the word from *genizers*, which, in the Turkiſh language, ſignifies *novi homines*, or *milites*. D'Herbelot tells us, that *jenitcheri* ſignifies a *new band* or *troop;* and that the name was originally given by Amurath I. called the Conqueror, who, chooſing out one-fifth part of the Chriſtian priſoners whom he had taken from the Greeks, and inſtructing them in the diſcipline of war and the doctrines of their religion, ſent them to Hagi Bektaſche (a perſon whoſe pretended piety rendered him extremely revered among the Turks), to the end that he might confer his bleſſing on them, and at the ſame time give them ſome mark to diſtinguiſh them from the reſt of the troops. Bektaſche, after bleſſing them in his manner, cut off one of the ſleeves of the fur gown which he had on, and put it on the head of the leader of this new militia; from which time, *viz.* the year of Chriſt 1361, they have ſtill retained the name *jenitcheri*, and the fur cap. Others aſcribe their origin to ſultan Amurath II. in the year 1372, and others again to Orcan, the predeceſſor of Amurath I.

The janizaries are children of tribute, levied by the Turks among the Chriſtians, and bred up to the military life. They are taken at the age of twelve years, to the end, that forgetting their country and religion, they may know no other parent but the ſultan. However, generally ſpeaking, they are not now-a-days raiſed by way of tribute; for the carach, or tax, which the Turks impoſe on the Chriſtians, for allowing them the liberty of their religion, is now paid in money; excepting in ſome places where money being ſcarce, the people are unable to pay in ſpecie, as in Mingrelia, and other provinces near the Black ſea. At preſent the Turks make no ſcruple of recruiting their janizaries with natives; and as there are ſome of theſe troops in the provinces as well as at Conſtantinople, it is not eaſy to aſcertain their number. At firſt this military corps conſiſted of no more than 12,000 men, and they ſeemed to be particularly deſigned as a guard to the emperor's perſon; and it was afterwards augmented by the ſucceſſors of the founder to 50,000. Selim, the ſon of Bajazet, reduced them; but ſince his reign their number has again ſo increaſed, that they have compoſed the principal force of the Turkiſh army.

As in the Turkiſh army, the European troops are diſtinguiſhed from thoſe of Aſia, the janizaries are alſo diſtinguiſhed from the janizaries of Conſtantinople, and of Damaſcus. At Conſtantinople Sultan Soliman built barracks for the janizaries, and beſtowed a ſplendid gilding on the cielings of the porticos, which his ſucceſſors have always maintained, though they have entirely neglected the diſcipline which he eſtabliſhed. This diſregard of good order, by totally deſtroying the ſpirit of the inſtitution, has increaſed the number of thoſe who receive pay.

Their pay is from two aſpers to twelve per diem; for when they have a child, or do any ſignal piece of ſervice, their pay is augmented. Baron de Tott ſays, that the pay of the janizaries is duly diſtributed every three months, and that it has a progreſſive increaſe from three aſpers to ninety-nine.

Their dreſs conſiſts of a dolyman, or long gown, with ſhort ſleeves, which is given them annually by the grand ſeignior, on the firſt day of Ramazan. They wear no turban, but in lieu of that a kind of cap which they call *zarcola*, and a long hood of the ſame ſtuff hanging on their ſhoulders. On ſolemn days they are adorned with feathers, which are ſtuck in a little caſe in the fore-part of the bonnet. On occaſions of this kind the janizaries appear without arms, and with their hands croſſed before them; and except the red ſhoes, great blue breeches and bonnet which they are obliged to wear, they dreſs themſelves in what colour they pleaſe, and their uniform conſiſts only in the cut of their clothes.

Their arms in Europe, in a time of war, are a ſabre, a carabine, or muſket, and a cartouch-box hanging on the left ſide. At Conſtantinople, in time of peace, they only carry a long ſtaff in their hand. In Aſia, where powder and fire-arms were more uncommon, they wore a bow and arrow, with a poignard, which they called *haniare*.

The officer who commands the whole body of janizaries is called the *janizar agaſi;* in Engliſh, aga of the janizaries. He is one of the chief officers of the empire.

The corps of janizaries is divided into regiments, which are called "Baluck," and the commander of every regiment is denominated "Baluck-Aga:" theſe regiments are diſtributed into barracks, or "odas," the ſoldiers of which live together, when they are at Conſtantinople or in the provinces. M. de Peyſſonel, in his "Strictures on the Memoirs of Baron de Tott," mentions the diviſion of them into "Ortas," "Buluks," and "Seymens," forming in all 196 companies, *i.e.* 101 ortas, 61 buluks, and 34 ſeymens. Theſe companies are again ſubdivided. To this corps alſo belong the "Yerlis," or provincial militia of the janizaries, commanded by a "Serdar," in the cities which are not conſidered as places of ſtrength, and where they have no janizary-aga; alſo the "Yamaks," or garriſoned invalids; and the "Otouraks," or invalids exempted from ſervice. In the garriſon and in the field they are divided into "Sag Kol," and "Sol Kol," or right wing and left wing, each of which has its ſeparate ſtandard and reſpective aga, one of whom is ſtyled "Sag Kol Agaſſi," and the other "Sol Kol Agaſſi." There are alſo companies of volunteers, which are raiſed in time of war, and maintained by the officers at their own expence. To this claſs of military alſo belong gunners, bombardiers, pioneers, miners, &c. In the army the janizaries encamp together by tens; every ten having a horſe to carry their ſmall baggage and cloaks, with a ſervant to cook for them; and every twenty a camel to carry two tents, two large carpets on which to ſleep, two kettles, and two leather veſſels in which to carry water; when they cannot get camels, they make uſe of waggons furniſhed by the country through which they paſs. With regard to their tactics, they form their battalions very deep, and their ſquadrons very large; they are exerciſed in the uſe of their arms, and to preſerve their ranks and files; but with leſs order and exactneſs than the troops of the Chriſtians. They never had pikes, but their favourite weapon has always been the ſcymetar. In former times they fought with darts, arrows, and hatchets; but, at preſent, the whole of their infantry is provided with firelocks. M. de Bonneval attempted to inſtruct them in handling the bayonet, and formed a ſmall body to the uſe of that weapon; but it declined and dwindled away ſince his death. Their ordinary mode of fighting is to fire their pieces and then fall on the enemy, ſabre in hand, with very loud ſhouts, but without any order, notwithſtanding which their number, their impetuoſity, and the weight of their ſhock, render them very formidable, particularly in the firſt onſet; after one or two repulſes their fury abates, and it is not eaſy to bring them again to the charge.

Though the janizaries are not prohibited marriage, yet they rarely marry, nor then, but with the conſent of their officers; as imagining a married man to make a worſe ſoldier than a bachelor.

The janizaries were at firſt called *jaja*, that is, footmen, to diſtinguiſh them from the other Turks, the troops whereof conſiſted moſtly of cavalry.

Vigenere tells us, that the diſcipline obſerved among the janizaries is extremely conformable, in a great many things, to that uſed in the Roman legions.

The janizaries were heretofore a body formidable even to their maſters, the grand ſeigniors. They depoſed Bajazet II. in 1512; they procured the death of Amurath III. in 1595. Oſman II. they firſt ſtripped of his empire, and afterwards of his life, in 1622; and in about two months dethroned Muſtapha, whom they had made his ſucceſſor; and in 1649 they depoſed ſultan Ibrahim, and at laſt ſtrangled him in the caſtle of the Seven Towers; and in 1730 they obtained the ſacrifice of the grand vizier, the reis effendi, and the captain baſhaw, and depoſed and impriſoned Achmet III. and advanced the ſultan Mahomet, ſon of Muſtapha II from priſon to the throne in his ſtead. The number of real janizaries has been variouſly eſtimated; but the privileges belonging to their order, ſuch as exemption from taxes, and the performance of public duties, have induced many perſons to bribe the officers, in order to their being admitted into the number of janizaries without pay.

Baron de Tott ſays that the number of thoſe who receive pay amounts to 400,000, but that of thoſe who are enrolled is unlimited. He allows, however, that 20,000 are ſcarcely ever collected at once, and that this number is principally compoſed of thoſe who receive but little pay, or, perhaps, none; having only entered the ſervice to obtain a right to it. The enrolled janizaries are ſo numerous, ſays M. de Peyſſonel, as to amount, if their number could be aſcertained, to ſeveral millions; nevertheleſs, they are only eſtimated at 40,000, on which account they are called "Kirk in Koul," or the forty thouſand ſlaves; and though there may be 400,000 on the pay-liſt, it is certain the treaſury does not iſſue pay for more than 40,000, that being only received by the janizaries of the "odas," or barracks, at Conſtantinople, and thoſe who in the garriſons have followed their "kettle." All thoſe who are not with the ſtandard are called "Yamaks," and receive no emolument.

Although the janizaries were once the terror of the natives, and ſometimes of the ſultans themſelves, whom they have by their inſurrections and rebellions occaſionally dethroned and murdered, their valour has declined, their diſcipline is relaxed, and their tumultuary array is incapable of contending with the order and weapons of modern tactics; but at the time of their inſtitution, they poſſeſſed a deciſive ſuperiority in war; becauſe a regular body of infantry, in conſtant exerciſe and pay, was not maintained by any of the princes of Chriſtendom.

The janizaries of Syria are an enrolled national militia, conſiſting of a certain number in each pachalic, who muſt hold themſelves in readineſs to march whenever they are required. As there are certain privileges and exemptions annexed to their body, there is a competition for obtaining admiſſion into it. Formerly they were ſubject to regular exerciſe and diſcipline; but all regard to this has ſo declined, that within the laſt 60 or 80 years, ſays Volney (Travels in Egypt and Syria, vol. ii.), there no longer remains the ſlighteſt trace of their ancient good order. Theſe pretended ſoldiers are only a crowd of artizans and peaſants, as ignorant as the reſt of that claſs, and infinitely leſs tractable. When a Pacha abuſes his authority, they are always the firſt to erect the ſtandard of ſedition. They depoſed and expelled Abdi Pacha from Aleppo, and compelled the Porte to ſend another in his ſtead. The Turkiſh government, it is true, avenges itſelf by ordering the moſt active mutineers to be ſtrangled; but, at the firſt opportunity that occurs, the janizaries create other chiefs, and affairs return to their uſual courſe. The Pachas, ſeeing themſelves thwarted by this national militia, have had recourſe to the expedient practiſed in ſimilar caſes; they have taken foreign ſoldiers into their ſervice, who have neither friends nor families in the country. Theſe are of two ſorts, cavalry and infantry. The former are called *Delibaches* and *Leventi*, and the latter *Mograbians*, which ſee reſpectively.

In Egypt the janizaries, and alſo the Azabs, which two bodies of the military corps were formerly the terror of the Pacha, have been ſo degraded by the influence of the Mamlouks, that they are now as inſignificant as himſelf. The cauſe of this has been the corrupt and wretched government of the Turks; for, previouſly to the inſurrection of Ibrahim Kiaya, the number of Turkiſh troops, which ſhould conſiſt of 40,000 men, infantry and cavalry, had been reduced to leſs than half that number by the avarice of their officers, who diverted the pay to their own uſe. After Ibrahim, Ali Bey completely deſtroyed their conſequence. He firſt diſplaced all the officers who gave him umbrage; left unfilled the places that became vacant; deprived the commanders of all influence; and ſo degraded all the Turkiſh troops, that at this day the janizaries, the Azabs, and the five other corps, are only a rabble of artizans and vagabonds, who guard the gates of thoſe who pay them, and tremble in the preſence of the Mamlouks, in whom the whole military force of Egypt conſiſts. See MAMLOUKS.

JANIZARIES, at Rome, are officers or penſioners of the pope, called alſo *participantes*, on account of certain rites or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.

Moſt authors are miſtaken in the nature of their office. The truth is, they are officers of the third bench, or college of the Roman chancery. The firſt bench conſiſts of writers, the ſecond of abbreviators, and the third of janizaries; who are a kind of correctors and reviſors of the pope's bulls.

JANKOONIES TOWN, in *Geography*, a town of Africa, in Loango, on the coaſt. S. lat. 4° 30′.

JANMIER, a town of Hindooſtan, in Guzerat, on the gulf of Cambay; 38 miles S. of Gogo.

JANNA, or JANNINA, a conſiderable town of European Turkey, in the province of Theſſaly, the ſee of a Greek biſhop, ſituated on a lake which communicates with the river Peneus, and gives name to the province; 40 miles W. of Lariſſa. N. lat. 40°. E. long. 21° 38′.

JANNANINS, in *Modern Hiſtory*, the name which the negroes, in ſome of the interior parts of Africa, give to ſpirits which they apprehend to be the ghoſts or ſouls of their anceſtors, and which they go to the tombs to conſult and worſhip. Every negro has his tutelary jannanin, and ſo has likewiſe every village, to whom private and public worſhip is reſpectively addreſſed. The women, children, and ſlaves are forbid to attend their public worſhip.

JANNEQUIN, Clement, in *Biography*, a French compoſer, who flouriſhed early in the 16th century, during the moſt ſplendid period of the reign of Francis I. when, though we hear of but few great muſicians at his capital, yet ſo many ſubſiſted, particularly in the Low Countries, that muſic in parts became common from that ſchool all over Europe; and Jannequin, though he is placed by Walther in the middle of the 16th century, muſt have flouriſhed much earlier; as a curious compoſition by him, called "La Battaille," printed in the tenth book of "French Songs for four Voices or Inſtruments," is preſerved in the Britiſh Muſeum, which, though it did not appear in this edition, by Tylman Suſato, of Antwerp, till 1545, muſt have been compoſed long before that time; for the ſong was written and ſet on occaſion of the famous and obſtinate battle of Marignan, which laſted two days, and was fought during the firſt year of Francis I. 1515, between the French and Swiſs, who diſputed their paſſage to the Milaneſe.

As this compoſer ſeems the firſt who tried to prove that muſic as well as painting and poetry was an imitative art, we ſhall give the whole title of the book of French ſongs for four voices or inſtruments preſerved in the Britiſh Muſeum.

"Le Dixieſme livre des Chanſons, contenant La Battaile à 4, de Clement Jannequin, avec la cinquieſme partie de Phillippe Verdelot, ſi placet, et deux Chaſſes du Lievre à 4 Parties, et le Chant des Oyſeaux à 3, 1545.

"La Battaille, ou défaite des Suiſſes à la journée de Marignan; à 4 ou à 5, Clem. Jannequin.

"Le Chant des Oyſeaux, à 3. Nic. Gombert.

"Le Chaſſe du Lievre, à 4. Incognito Authori.

"La Chaſſe du Lievre, à 4. Nic. Gombert."

In the Battle-piece, as well as in the other imitative pieces in the ſame collection, there are ſeveral long movements in the Battaille, in which the noiſe and din of war, during this memorable conflict, are imitated. In the ſong of birds, and in each compoſition called "The Chace," or hunting of the hare, the compoſers have ſeverally tried to expreſs the words with more exactneſs than we had ſeen attempted before. Indeed, the beſt counter-point and the moſt ingenious contrivances, with reſpect to muſical compoſition, anterior to this period, are contained in the maſſes and motets of the church, where nothing like expreſſion, or even the true accent of words is attempted. But here, though clumſily done, we have ſpecimens of muſical imitations, it ſhould ſeem, for the firſt time.

The name and works of Jannequin had penetrated into Italy early in the 16th century, as we find by Zarlino, the elder Doni's catalogue of muſic, Pietro Pontio, and Zacconi. A work of his, entitled "Inventions Muſicales," in four and five parts, was publiſhed at Paris and Lyons, 1544.

JANNI, St., in *Geography*, a ſmall iſland in the Mediterranean, near the coaſt of Naples. N. lat. 39° 59′. E. long. 13° 52′.

JANNOCK, a kind of oaten bread, much uſed in the northern parts of England, and made of four leaven.

JANOHAH, in *Scripture Geography*, a city of Ephraim, on the frontiers of the half tribe of Manaſſeh. Joſh. xvi. 6. Euſebius places a town called "Jano," 12 miles from Schechem or Naplouſe, in the Acrabatene, and another 3 miles from Legio, ſouth.

JANOURA, in *Geography*, a town of Hindooſtan, in Bahar; 16 miles S.W. of Bahar. N. lat. 25° 8′. E. long. 85° 34′.

JANOW, a town of Poland, in the palatinate of Kaminiec; 44 miles N.N.W. of Kaminiec.—Alſo, a town of Poland, in the palatinate of Lublin; 36 miles S. of Lublin. —Alſo, a town of Lithuania, in the palatinate of Brzeſc; 24 miles S.W. of Pinſk.

JANOWIECZ, a town of Poland, in the palatinate of Sandomirz; 16 miles E. of Radom.

JANOWITZ, a town of Bohemia, in the circle of Kaurzim; 8 miles S. of Bentſchow.—Alſo, a town of Bohemia, in the circle of Pilſen; 30 miles S.S.W. of Pilſen. N. lat. 49° 19′. E. long. 13° 8′.

JANOWITZKY, a town of Bohemia, in the circle of Czaſlau; 9 miles S.W. of Czaſlau.

JANOWKA, a town of Poland, in the palatinate of Volhynia; 40 miles N.E. of Zytomiers.

JANOWOW, a town of Auſtrian Poland, in Galicia; 16 miles W.S.W. of Lamberg.

JANOZKI, John Daniel, in *Biography*, was born at Wiemar in 1720. He diſtinguiſhed himſelf by his literary talents; and, by ſeveral uſeful works which he publiſhed, rendered great ſervice to the literary hiſtory of Poland. His principal works are, 1. "Letters on Criticiſm," in two volumes; 2. "Account of rare Poliſh Books in the Zaluſki library:" in this work he gives the titles of the books at full length, with an account of their contents; relates the hiſtory of them, makes known his opinion of their merits, and interſperſes the whole with intereſting anecdotes, reſpecting the lives, ſervices, and characters of the authors; 3. "A Dictionary of living Authors in Poland;" and, 4. "Polonia Litterata noſtri Temporis." In another work, entitled "Janociana, ſive clarorum atque illuſtrium Virorum Poloniæ Auctorum, Mecenatumque Memoriæ miſcellaneæ," the author gives a farther account of the Poliſh writers and their productions. His information, beſides the authors, comprehends alſo friends and promoters of the ſciences, whether Poles or foreigners, ſettled in that country. The two volumes comprize nearly 300 names in alphabetical order. Gen. Biog.

JANPOUR, in *Geography*, a town of Bengal; 20 miles S.W. of Midnapour. N. lat. 22° 15′. E. long. 87° 7′.

JAN-RAIA, in *Botany*, a name contrived by Plumier, in defiance of orthography, as uſual with his countrymen, to perpetuate the memory of the great John Ray, the word *Raia* being already beſtowed on a genus of fiſhes. Linnæus improved it to Rajania, to which article we refer our readers.

JANSAW, in *Geography*, a town of Pruſſia, in the province of Oberland; 24 miles E. of Marienwarder.

JANSENISM, in *Eccleſiaſtical Hiſtory*, the doctrine of Cornelius Janſen, commonly called *Janſenius*, biſhop of Ypres, in Flanders, chiefly with relation to grace and free-will.

Janſenius was born of Catholic parents in Holland, and ſtudied at Utrecht, Louvain, and Paris.

Janſeniſm made no great noiſe in the world, till after the death of its author, in 1638, when Fromond and Calenus, his executors, publiſhed his book, entitled "Auguſtinus." This book had been the labour of 20 years, was juſt finiſhed before the author's death, and publiſhed at Louvain in 1640. Janſenius was led to engage in this work by the controverſy that was carried on, in the beginning of the 17th century, between the Jeſuits and Dominicans, concerning the nature and neceſſity of divine grace; the deciſion of which had, towards the concluſion of the preceding century, been committed by Clement VIII. to a ſelect aſſembly of learned divines. Theſe arbiters, after much examination, delivered their opinion to the pontiff, that the ſentiments of the Dominicans, concerning grace, predeſtination, human liberty, and original ſin, were more conformable to the doctrine of ſcripture, and the deciſions of the ancient fathers, than the opinions of Molina, which were patroniſed by the Jeſuits. The former, they obſerved, inclined to the tenets of Auguſtine, and the latter bore a ſtriking reſemblance to the Pelagian hereſy. In conſequence of this declaration, Clement ſeemed reſolved to condemn the Jeſuits, and to determine the controverſy in favour of the Dominicans. In 1602 the Jeſuits prevailed on the old pontiff, by intreaties, menaces, arguments, and complaints, to re-examine this intricate controverſy, and to undertake the office of principal arbitrator. For this purpoſe he choſe a council, called the congregation *de auxiliis,* or the congregation of *aids*, compoſed of 15 cardinals, nine profeſſors of divinity, and five biſhops, which, in the ſpace of three years, aſſembled 78 times. The death of Clement, in 1605, prevented his pronouncing a deciſive ſentence with regard to this controverſy; nor are his ſentiments certainly known, though the Jeſuits and Dominicans contend, that his deciſion would have been favourable to their reſpective party. The proceedings of this congregation were reſumed, in 1605, by order of Paul V. the ſucceſſor of Clement. The reſult of many ſolemn deliberations was, that the whole controverſy, inſtead of being decided, ſhould be ſuppreſſed; and that each of the contending parties ſhould have the liberty of following their reſpective opinions. Paul V. declined a public determination of the controverſy, through apprehenſion of offending either the king of France, who protected the Jeſuits, or the king of Spain, who warmly maintained the cauſe of the Dominicans. The flame of controverſy broke out again with new violence in the year 1640, on the publication of Janſenius's book, which was divided into three parts: the firſt being hiſtorical, and containing a relation of the Pelagian controverſy, which aroſe in the fifth century: in the ſecond the author gives an accurate account and illuſtration of the doctrine of Auguſtine, relating to the conſtitution and powers of the human nature, in its original, fallen, and renewed ſtate: and the third part contains his doctrine relating to the aid of ſanctifying grace procured by Chriſt, and to the eternal predeſtination of men and angels. The deſign of Janſenius, in this work, was to ſhew in what manner the important points in debate had been underſtood and explained by Auguſtine, whoſe name and authority were univerſally revered in all parts of the Roman Catholic world. The Dominicans, who followed the ſentiments of Thomas Aquinas concerning the nature and efficacy of divine grace, derived very conſiderable advantage from this publication; whilſt the Jeſuits conſidered it as not only a tacit but formidable refutation of their opinions concerning human liberty and divine grace. They therefore exerted their moſt zealous endeavours to obtain a public condemnation of it from Rome; and they ſucceeded ſo far as to procure a prohibition of the peruſal of it, by the Roman inquiſitors, in the year 1641; and in 1642 a ſolemn bull of Urban VIII. condemning it as fraught with ſeveral errors that had been long baniſhed from the church. However, the deciſions of the inquiſition, and bull of the pontiff, were diſregarded in many parts of the Roman church. The doctors of Louvain, the followers of Auguſtine in the Netherlands, and the abbot of St. Cyran, and other famous and learned men, known under the denomination of the Authors of Port-royal, in France, oppoſed the proceedings of the Jeſuits, and ſtrenuouſly ſupported the cauſe of Janſeniſm, though the greateſt part of the French theologiſts engaged in behalf of the Jeſuits. The diſpute was now become very general and violent; and both parties exerted all their learning, art, intereſt, and power, to vindicate their reſpective cauſe. The Janſeniſts recurred to miracles in confirmation of their doctrine; and the hiſtory of the controverſy furniſhes many legendary tales of miraculous cures wrought in its favour; the firſt of theſe miracles occurs in 1656, when a pretended thorn of that deriſive crown that was put upon our Saviour's head by the Roman ſoldiers, is reported to have performed ſeveral wonderful cures in the convent of Port-royal: theſe were ſucceeded by other prodigies in the years 1661 and 1664. The ſame pious frauds were revived in 1725, 1727, and 1731, when the bones of the Abbé de Paris, which were interred at St. Medard, are ſaid to have been inſtrumental in performing innumerable miracles. However, the oppoſers of the doctrines of St. Auguſtine ſelected five propoſitions out of Janſenius's book, which, by the intereſt and importunities of the Jeſuits, were condemned by a public bull of Innocent X. in 1653. Theſe propoſitions contained the following doctrines:

I. Some commands of God are impoſſible to righteous men, even though they endeavour, with all their powers, to accompliſh them; the grace being wanting by which they ſhould be enabled to perform them. II. In the ſtate of corrupted nature, a man never reſiſts inward grace. III. To merit and demerit in the preſent ſtate of corrupt nature, it is not requiſite a man ſhould have that liberty which excludes neceſſity: that which excludes conſtraint is ſufficient. IV. The Semipelagians admitted the neceſſity of inward preventing grace to each act in particular, and even to the beginning of faith; but they were heretics, in regard they aſſerted, that this grace was ſuch as that the will of man might either reſiſt or obey it. V. It is Semipelagianiſm to ſay, that Jeſus Chriſt died, or ſhed his blood, for all men in general.

Of theſe propoſitions the pontiff declared the firſt four only heretical; but he pronounced the fifth raſh, impious, and injurious to the Supreme Being.

The Janſeniſts, availing themſelves of a ſubtle diſtinction invented by Arnaud, conſidered ſeparately in this controverſy the matter of doctrine, and the matter of fact, *i. e.* they acknowledged themſelves bound to believe that the five propoſitions above mentioned were juſtly condemned by the Roman pontiff; but they maintained, that the pope had declared, and conſequently, that they were not bound to believe, that theſe propoſitions were to be found in Janſenius's book, in the ſenſe in which they had been condemned. But this artful diſtinction was of no long ſervice to them; for Alexander VII. iſſued out a ſolemn bull in 1656, declaring, that the five propoſitions that had been condemned were the tenets of Janſenius, and were contained in his book; and in 1665 he ſent into France the form of a declaration, that was to be ſubſcribed by all who ſought preferment in the church, affirming that the five propoſitions were to be found in the book of Janſenius, in the ſame ſenſe in which they had been condemned by the church. This declaration produced the moſt deplorable tumults: the Janſeniſts maintained that the deciſions of the pope, ſo far as they were not confirmed by a general council, with regard to matters of fact, were fallible; and the Jeſuits, on the contrary, that unlimited confidence in the papal deciſions, both with reſpect to matters of fact and of opinion, was an eſſential character of a well-grounded and divine faith. The Jeſuits prevailed, and the Janſeniſts ſuffered exile, impriſonment, and various kinds of perſecution. Clement IX. in conſequence of the ſpirited remonſtrance of ſeveral biſhops, and the earneſt application of Anne Genevieve de Bourbon, ducheſs of Longueville, accepted a conditional ſubſcription to the declaration of his predeceſſor, allowing the Janſeniſts the privilege of interpreting it in their own ſenſe. This indulgence reſtored tranquility, and produced a period in this controverſy, commonly called the "Peace of Clement IX."

but it was ſoon diſturbed again by a public edict of Lewis XIV. and totally aboliſhed after the death of the ducheſs of Longueville, in the year 1679. The famous Arnaud retreated on this occaſion into Holland, where he gained over the Romiſh congregations to the Janſeniſt party: and this party, ſecured under the protection of the Dutch government, has ſince prevailed in that country. The Janſeniſts were particularly offenſive to the Jeſuits, on account of the auſterity of their party, and the ſeverity that reigned in their ſyſtem of moral diſcipline and practical religion: for they have exclaimed againſt the corruptions of the church of Rome, both with regard to its doctrines and morals; and urged the neceſſity of inſtructing the people in the doctrines and precepts of Chriſtianity: with this view they have maintained that the holy ſcriptures and public liturgies ſhould be peruſed by the people in their mother tongue; and taught, that true piety does not conſiſt in the obſervance of pompous rites, or in the performance of external acts of devotion, but inward holineſs and divine love. This apparent piety of the Janſeniſts has, however, been unhappily blended with ſuperſtition and fanaticiſm; and they have been branded, not altogether without reaſon, with the denomination of Myſtics and Rigouriſts. (See Quietism.) The controverſy relating to Janſeniſm, which was one of the principal ſources of that diviſion which reigned within the papal juriſdiction, has been carried on with great animoſity in France and the Netherlands; and the Janſeniſts were for a conſiderable time much inferior to the Jeſuits in number, power, and influence, though they equalled their adverſaries in reſolution, prudence, and learning, and ſurpaſs them in ſanctity of manners and ſuperſtition, by which they excite the reſpect of the people. The United Provinces, particularly the Netherlands, have afforded them an aſylum on many occaſions: nevertheleſs the Jeſuits, though they had no legal toleration in the republic, have gained ground among the Dutch papiſts. They had a flouriſhing chapel in the city of Utrecht, and places of worſhip in ſeveral other cities, and in a great number of villages. Towards the cloſe of the 17th and the commencement of the 18th centuries, the cauſe of the Janſeniſts acquired reputation, by a French tranſlation of the New Teſtament, made by the learned and pious Paſchaſius Quenel, a prieſt of the Oratory; in the annotations to which he has artfully blended the quinteſſence of Janſeniſm. This work, at the inſtigation of the Jeſuits, and particular application of Lewis XIV. to the court of Rome, was condemned by Clement XI. who, in 1713, iſſued out the famous bull Unigenitus, in which Quenel's New Teſtament was condemned, and one hundred and one propoſitions contained in it pronounced heretical. The controverſy relating to Janſeniſm was much heated and increaſed, inſtead of being mitigated or ſuſpended, by this deſpotic and ill-judged edict. The Janſeniſts were again obliged to recur to writing, and even to miracles and viſions, and pretended revelations for the ſupport of their declining cauſe. However, the ſtorm of reſentment that afterwards aroſe againſt the Jeſuits, and that has been attended with the extinction of their order in Portugal, France, and in all the Spaniſh dominions, has diſarmed the moſt formidable adverſaries of Janſeniſm, and muſt be conſidered as an event highly favourable to the Janſeniſts. Moſheim's Eccl. Hiſt. vols. v. and vi. Eng. ed.

JANSENIUS, Cornelius, in *Biography*, a learned Flemiſh prelate, born at Hulſt in the year 1510, and educated at Ghent and Louvain, became a proficient in the Hebrew, as well as Greek and Latin languages, and devoted himſelf to the ſtudy of the ſcriptures. After occupying ſome ſubordinate ſtations in the exerciſe of his miniſtry, he was appointed profeſſor of divinity at Louvain, and admitted to the degree of doctor of divinity. In the famous council of Trent he commanded reſpect by his learning and modeſty, and upon his return to Flanders in 1568, he was nominated the firſt biſhop of Ghent, where he died in 1576. His works were "A Paraphraſe on the Pſalms," with copious notes, in Latin, printed at Louvain in 1569; "Notes on the Books of Proverbs, Eccleſiaſticus, the Canticles, and the Book of Wiſdom," printed in 1586: "Commentaries upon ſome Paſſages in the Old Teſtament," &c. His chief work, however, was the "Concordia Evangelica," firſt printed in 1549 and frequently reprinted. Of this work Dupin ſays, that it is the moſt perfect harmony of the four goſpels which had till that time appeared. To the author he pays a very diſtinguiſhed tribute of reſpect, as a very able expoſitor of ſcripture, and eminently characterized by his learning, judgment and perſpicuity. Dupin. Gen. Biog.

Jansenius, Cornelius, biſhop of Ypres and founder of the Janſeniſts, was born at a village near Leerdam, in Holland, in the year 1585; and having commenced his ſtudies at Utrecht, finiſhed them at Louvain in 1602. Removing to Paris on account of the ſtate of his health, which had been impaired by his aſſiduous application, he renewed his connexion with the abbot of St. Cyran, with whom he had commenced an acquaintance at Louvain. At Bayonne theſe two friends, after temporary ſeparation, met again, and concurred for five or ſix years in the ſtudy of the fathers, and particularly of St. Auguſtine. The abbot Du Verger was here promoted to a canonry in the cathedral, and Janſenius was placed at the head of a college. Upon Du Verger's removal to Paris, Janſenius returned to Louvain, and was ſoon appointed principal of the college of St. Pulcheria. In 1617, he took his degree of doctor of divinity, and was admitted one of the profeſſors of that faculty, in which office his talents and learning were conſpicuouſly diſplayed. On occaſion of the interference of the Jeſuits with ſome privileges belonging to the univerſity of Louvain, Janſenius was ſelected as a fit perſon to ſtate and vindicate their rights in an embaſſy to the king of Spain. For this purpoſe he made two journies into that country, *viz.* in 1624 and in 1625; and in the year 1630 he was appointed by the king profeſſor of the holy ſcriptures in the univerſity of Louvain. In this year he engaged in a controverſy with the Proteſtants; and this controverſy produced on his part a piece entitled "Alexipharmacum," printed in 1630; another under the title of "Notarum Spongia," &c. in 1631. Another controverſy of a ſimilar kind engaged his attention in 1634, in the conduct of which he had recourſe, in a manner that reflects diſgrace on his name and memory, to meaſures of perſecution againſt his adverſary, inſtead of contenting himſelf with the more appropriate weapons of argumentation. In the year 1635 he publiſhed a work, which, however acceptable to his patron, the Spaniſh monarch, conferred no honour on the ſpirit of the writer; it was entitled "Alexandri Patricii Armacani, Theologi, Mars Gallicus, ſeu Juſtitiæ Armorum et Fœderum Regis Galliæ Libri duo," and contains the moſt malignant and invidious exclamations againſt the ſervices which were rendered by France to the Proteſtants of Holland and Germany, to the prejudice of the Romiſh religion. In conſequence of this publication he was promoted to the biſhopric of Ypres. His conduct on this occaſion, and the publication of the above-mentioned book, are ſaid to have firſt excited the enmity of cardinal Richelieu againſt the author and his followers, and the partiality of the court in favour of the Jeſuits. Janſenius, however, ſedulouſly engaged in the reform of his dioceſe; but was prevented from accompliſhing the work which he had begun by his death, which happened in 1638, when he was about

53 years of age. He died highly reſpected for learning and other eminent qualifications, as well as for his piety and virtues. His works, beſides thoſe already mentioned, were "Tetrateuchus, ſive Commentarius in IV Evangelia," 4to. "Pentateuchus, ſive Commentarius in V libros Moyſis," 4to. "Analecta in Proverbia, Eccleſiaſten, Sapientiam, Habacuc, et Sophoniam," 4to.: "De Vi obligandi Conſcientias quam habent Edicta regia ſuper Re Monetaria:" "De Juramento quod publica Auctoritate Magiſtratui deſignato imponi ſolet;" "Oratio de interioris huminis Reformatione," and, more particularly deſerving of mention, his "Auguſtinus, ſeu Doctrina Sti. Auguſtini de Humanæ Naturæ Sanctitate, Ægritudine, Medicina, adverſus Pelagianos et Maſſilienſes," fol. This latter work occaſioned the controverſy, of which we have given an account under the article Janseniſm, to which the reader is referred. Dupin. Bayle. Moſheim.

Janſenius, James, a learned theological profeſſor at Louvain, was born of Catholic parents at Amſterdam in the year 1547, and completed his ſtudies at Louvain, whither he was ſent for this purpoſe in 1564. In 1575 he was admitted a licentiate in divinity, and was afterwards nominated firſt preſident of the new Auguſtine college. Having riſen gradually to ſeveral offices of honour and duty in the church, he was at laſt, in 1614, appointed dean of the collegiate church of St. Peter's at Louvain; and died in 1625. Of his works, which have been held in high eſteem, we ſhall enumerate "Expoſitio in Prophetam Job," folio; "Commentarius et Expoſitio in Pſalmos Davidicos," 4to.; "Commentarius in Canticum Canticorum," 8vo.; "Expoſitio in Evang. Joann." 8vo.; "Inſtitutio Catholici Eccleſiaſtæ;" "Liturgica;" "In ſacrum Miſſæ Canonem;" "Enarratio Paſſionis," &c. &c. Moreri. Gen. Biog.

JANSI, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 110 miles S. of Agra. N. lat. 25° 32'. E. long. 78° 57'.

JANSONS, Meſſrs. in *Biography*, two brothers, the moſt celebrated performers on the violoncello in France, at the time when M. Laborde publiſhed his "Eſſais ſur la Muſique," and conſequently, according to that author, "the beſt in the univerſe." Theſe were rivals of the two brothers; Dupont, whoſe performance gave equal delight. It was hardly poſſible to play an adagio with more delicacy, taſte, and feeling than the eldeſt Janſon. The eldeſt Dupont's execution was truly aſtoniſhing; and it is among extraordinary circumſtances, that four ſuch performers on the ſame inſtrument ſhould flouriſh at the ſame time in one city.

JANSSENS, Abraham, an hiſtorical painter, born at Antwerp in 1569. He poſſeſſed great powers in the practical parts of the arts, but, negligent and diſſipated, he waſted thoſe powers, and fell into indigence. Being contemporary with Rubens, he was mortified at the ſucceſs of his younger rival, who drew from him the admiration of the public, and in a fit of ill humour challenged him to paint a picture for fame; deſiring to ſubmit their reputation to impartial judges. This propoſal was rejected by Rubens, who anſwered in a mild and becoming manner, that he ſubmitted to him; and the world would do juſtice to them both. The churches of the Low Countries poſſeſſed many excellent works of this maſter; but his chef-d'œuvre is the Reſurrection of Lazarus in the gallery at Duſſeldorf.

Janſſens, Honorius Victor, a painter, born at Bruſſels in 1664. Having applied ſedulouſly to the practice of the art, and made much proficiency, he was employed by the duke of Holſtein at a penſion of 800 florins, and afterwards enabled, by the ſame munificent patron, to purſue his ſtudies in Italy.

In Rome he ſtudied the works of Raphael, and became eminent in fame. He afterwards aſſociated with Tempeſta the landſcape painter, and painted figures in his pictures.

In general his pictures are ſmall in ſize, and have ſomewhat of the ſtyle of Albano. His invention was copious, and his works are very pleaſing. He died in 1739, at the age of 75.

Janſſens, Cornelius, called alſo *Johnſon*, a portrait painter of very extraordinary merit. He was born at Amſterdam; when, is not exactly aſcertained. It appears that he painted in England as early as the year 1618, in the reign of James I. Here he continued to paint with very great and deſerved ſucceſs till the arrival of Vandyke, whoſe tranſcendent talents and taſte Janſſens was not quite equal to cope with. On the breaking out of the civil war he returned to his own country, in 1648; leaving behind him a number of excellent characteriſtic portraits in the great families of this iſland.

He retired firſt to Middleburg, and afterwards to Amſterdam, where he died in 1665.

His ſtyle of deſign was formal and void of taſte, but his features are juſtly marked, and the faces of his portraits have great character, and an air of nature, poſſeſſing much ſweetneſs of tone in the colouring, and finiſhed very highly; too much ſo indeed. His pictures are generally on wood, and with black draperies; an arrangement adopted frequently by Rubens and Vandyke.

JANTECA, in *Geography*, a town of Hindooſtan, in the circar of Adoni; 59 miles N.W. of Adoni.

JANUARIUS, St., in *Biography*, biſhop of Benevento, who was beheaded at Puzzuoli in the perſecution of Diocletian. His body was brought to Naples, where a beautiful chapel is erected to his memory in the cathedral. What renders his name remarkable, is a pretended miracle exhibited yearly by the prieſts, who ſay they have the ſaint's real blood encloſed in a phial, which is either liquid or congealed at the pleaſure of theſe devout gentlemen. This wretched mummery is always practiſed when Mount Veſuvius ſhews ſigns of a convulſion, and the people believe that the influence of Januarius will prevent an earthquake. This pious fraud will ſcarcely live beyond the changes which are now taking place in Italy. Moreri. Addiſon's Travels.

Januarius, *St.*, *Order of*, was inſtituted July 2, 1738, by the Infant Don Carlos, then king of Jeruſalem and the two Sicilies, and afterwards king of Spain, who was grand maſter of the order, and the honour of which devolved on the king of the two Sicilies. The enſign of the order is a ſtar of eight points, enamelled white, edged with gold: in the centre is repreſented a biſhop, with half his body in clouds: on the reverſe is a book, on which are two vials red, ſurrounded with two palms, all enamelled in proper colours. The collar of the order is of gold, compoſed of caſtles, banners, mitres, roſes, &c. The badge in ordinary days is worn pendant to a broad deep-blue ribband.

Januarius's *Blood*. See *Religious uſes of* Blood. The head of this ſaint is occaſionally carried in proceſſion at Naples, in order to ſtay the eruption of Veſuvius.

JANUARY, the name of the firſt month of the year, according to the computation now uſed in the Weſt.

The word is derived from the Latin Januarius, a name given it by the Romans, from Janus, one of their divinities, to whom they attributed two faces; becauſe on the one ſide the firſt of January looked towards the new year; and, on the other, towards the old one. The word Januarius may alſo be derived from *janua,* gate; in regard to this month being the firſt, which is, as it were, the gate of the year.

January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.

The Chriſtians heretofore faſted on the firſt day of January, by way of oppoſition to the ſuperſtition of the heathens, who, in honour of Janus, obſerved this day with feaſtings, dancings, maſquerades, &c.

JANUB, in *Geography,* a town of Perſia, in the province of Kerman; 120 miles E. of Kabis.

JANVILLE, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Chartres, 21 miles S.E. of it. The place contains 1803, and the canton 10,368 inhabitants, on a territory of 290 kiliometres in 23 communes.

JANUM, in *Scripture Geography,* a city of Judah, mentioned Joſh. xv. 53.

JANUNA, in *Geography,* a town of Hindooſtan, in Goondwanah; 20 miles N. of Chanda.

JANUS, in *Mythology,* a divinity of the Romans, who, as it is ſaid, had the cuſtody and care of their gates (Janua). As to the origin of this deity, ancient authors are not agreed; but the moſt general opinion is, that he was not a native of Italy, but that he came thither from Perrhebia in Theſſaly, where, being a deſcendant from Deucalion by Ion his ſon, as fabulous hiſtory reports, he was originally ſettled. Ryckius dates the arrival of Janus with his colony in Italy in the 146th year before the taking of Troy; but as Theophilus of Antioch aſſures us, that Chronos, called by the Latins Saturn, and who was received by Janus into Italy, lived 321 years before the taking of Troy, there muſt have been more than an age and a half between him and Janus. Hence we ſhould be led to conclude, either that Saturn never came into Italy, or that he arrived there long before the time of Janus. Antiquity, however, aſcribes coexiſtence to theſe princes: therefore we muſt ſuppoſe that there was another Saturn, contemporary with Janus, whoſe original name was Stercus, the father of Picus; and that being deified by Janus, he was, after his apotheoſis, denominated Saturn. To this purpoſe we learn from Aurelius Victor, that Janus, having landed in Italy, and made various conqueſts, took poſſeſſion of a mountain, and there built a city which he called after his own name, "Janiculum." In the time of his reign, Saturn, baniſhed from his own country, landed alſo in Italy; where Janus kindly received him, and made him his aſſociate in the empire. Saturn built a fortreſs near Janiculum and called it "Saturnia." The part of the country which Janus firſt occupied was Latium; and it is ſaid that the inhabitants, before the arrival of this prince, led a ſavage life, without laws and almoſt without religion; and that he ſoftened the ferocity of their manners, brought them to live together in cities and villages, gave them laws, and cauſed his ſubjects to enjoy under his reign a happineſs which they had never known before; accordingly this period was denominated the golden age. From this change of condition, produced by the counſels and influence of Janus, the inhabitants rendered him divine honours; and he has been regarded, not as one of the great gods, but as one of the Indigetes. To him alſo, as we learn from Macrobius, all the paſſages from or to the houſes were conſecrated; becauſe, according to the Mythologiſts, every family in the time of Janus was diſtinguiſhed by religion and ſanctity. It is added, that he was the firſt who built temples, and inſtituted ceremonies of religion. Concerning the reaſon of his being repreſented with two faces, we have different accounts. Some ſay that he was thus exhibited, becauſe he commanded two nations; or becauſe, upon his ſharing the kingdom with Saturn, he cauſed medals to be ſtruck, bearing on one ſide a head with two faces, to expreſs that his power was divided between Saturn and himſelf, and that his dominions were to be governed by the counſels of both. Plutarch gives another account and ſays, that this repreſentation was intended to intimate that this prince and his people had, by wiſe and ſalutary counſels, paſſed from a wild ruſtic life to a life of civilization and humanity. Others ſay this appearance, or "bifrons," *i. e.* double faced figure, denoted that Janus knew the paſt and foreſaw the future. Others again, who are of opinion that Janus repreſented the ſun, pretend that he is exhibited double, becauſe he opens the day when he riſes, and ſhuts it when he ſets. From Athenæus we learn that Janus had two faces, one before, the other behind; and that he gave his name to a river and to a mountain on which he had ſettled. He is ſaid to have been the firſt who invented crowns, ſhips, and barges, and who coined money of braſs. Hence it happens, that ſeveral towns in Greece, Italy, and Sicily, coin money with a double head, with a barge on the reverſe, or a crown, or a ſhip. Some authors ſay, that the two faces repreſent his preſiding over *January* (which ſee); and others ſay that the two heads are thoſe of Janus and Saturn. For an account of his temple; ſee the next article.

JANUS, *Temple of,* in *Ancient Hiſtory,* a ſquare building at Rome (as ſome ſay) of entire braſs, erected by Romulus, after he had made peace with the Sabines, or, as Rollin ſays, by Numa, as an acknowledgment to the gods for the tranquillity Rome enjoyed at his acceſſion to the throne; it was ſo large as to contain a ſtatue of Janus five feet high, with two faces, intimating, that the Romans and Sabines were united into one people, and that the two kings, Romulus and Tatius, made but one head to govern them. It had brazen gates on each ſide, which were always kept open in time of war, and ſhut in time of peace. But the Romans were ſo much engaged in war, that this temple was ſhut only twice from the foundation of Rome till the reign of Auguſtus, and ſix times afterwards. It was *firſt* ſhut during the long reign of Numa, who inſtituted this ceremony. 2. In the year of the city 519, B. C. 235; after the end of the firſt Punic war. 3. By Auguſtus, after the battle of Actium, in the year of Rome 723, B. C. 31. 4. On Auguſtus's return from the war which he had againſt the Cantabrians in Spain, A. U. C. 729. B. C. 25. 5. Under the ſame emperor, in the year of Rome 744, about ten years before the birth of Chriſt, when there was a general peace throughout the whole Roman empire, which laſted twelve years. 6. Under Nero, A. U. C. 811. A. D. 58. 7. Under Veſpaſian, A. U. C. 824. A. D. 71. 8. Under Conſtantius, when upon Magnentius's death he was left ſole poſſeſſor of the empire, A. U. C. 1105. Some diſpute the authority on which it is ſaid to have been ſhut by Conſtantius, and ſay that the laſt time of its being ſhut was under Gordian, about the year of Rome 994, A. D. 241. Virgil gives us a noble deſcription of this cuſtom:

> "Sunt geminæ Belli portæ, ſic nomine dicunt, &c."
> Æn. lib. vii. ver. 607, &c.

The origin of this cuſtom is not certainly known. Accordingly when the conſul, appointed to command the army, was ready to ſet out, he went to this temple, attended by the ſenate, the chief citizens, and his ſoldiers in their military dreſſes, and opened its gates. The new conſuls took poſſeſſion of their offices in this temple; whence they were ſaid to open the year. See Macrob. Saturn. lib. i. cap. 9. and Virgil, Æn. lib. vii. v. 601, 622.

This temple was in the Roman forum, and Procopius ſays, that in his time the remains of it were ſtill to be ſeen there over-againſt the capitol, with a little niche of braſs, in which was his ſtatue.

There was a ſecond temple of Janus, built by Cn. Duillius, in the Forum Olitorum, or herb-market, after the firſt Carthaginian war; and this, being fallen into decay, was rebuilt by the emperor Tiberius, according to Tacitus, Annal. l. ii.

A third temple of Janus, called "Templum Jani Auguſti," was ſituated in the Velabrum, a little valley, on one ſide of the Forum Boarium, or ox-market, between the capitol and mount Aventine. It was a ſquare building of the Ionic order, and entirely of marble. Some ſay, that it was built by Numa, and repaired by Auguſtus; but others diſpute its high antiquity. This was the temple of Janus quadrifrons, or the four-faced Janus; and owed its origin as well as its name, to the following accident, according to Servius. The Romans, he ſays, after the taking of Faleria in Tuſcany, having met with a ſtatue of Janus that had four faces, were deſirous to have ſuch a one at Rome; and to honour him the more, they built for him a temple with four fronts, each having twelve niches in it, with a great gate, which denoted the four ſeaſons, and the twelve months of the year. Varro ſays there were alſo twelve altars in this temple, dedicated to Janus, each of which repreſented a month of the year.

JANYSUS, in *Ancient Geography*, a town of Syria, ſituated on the ſea-coaſt, between Gath and the Sirbonide lakes, according to Herodotus, who adds, that it is at the diſtance of three days' journey from mount Caſius.

JANZE', in *Geography*, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of Rennes; 5 miles S. of Chateau-Girons. The place contains 3513, and the canton 12,815 inhabitants, on a territory of 172½ kiliometres, in 6 communes.

JAO, a town of Japan, in the iſland of Niphon; 35 miles S. of Meaco.

JAOURHORISI, a town of Aſiatic Turkey, in the province of Diarbekir; 65 miles W. of Niſibin.

JAP. Among Hindoo myſtics great merit is aſcribed to abſtraction, or ſilent contemplation of the attributes of the deity. This is eſſayed by enthuſiaſtic individuals moſt perſeveringly; to the length, as is pretended, of complete abſorption of all intellectual power, by a ſort of ſpiritual union with the attribute or deity thus propitiated. Another ſpecies of abſtract devotion is called *Tapas* (which ſee); but this includes alſo penance and auſterity; whereas jap, we believe, is confined to abſtraction, induced by ſilent and intenſe contemplation. To promote this, the aſpirant ſometimes continues with cloſed eyes, or with his eyes fixed on the tip of his noſe. Roſaries are alſo uſed in the commencement of this ſpecies of devotion, or by thoſe who intend only a ſhort exerciſe of it. Such roſaries are called japmala.

JAPACANI, in *Ornithology*, a ſpecies of *Oriolus*; which ſee.

JAPAN, in *Geography*, a kingdom or empire, conſiſting of ſeveral iſlands, and ſituated near the eaſtern extremity of Aſia, between the 30th and 41ſt degree of N. latitude, and the 131ſt and the 142d degree of E. longitude. The coaſt of Japan is, according to Kæmpfer, the moſt dangerous in the whole world; and captain Gore found ſtrong and rapid currents ſetting along the eaſtern coaſt, which he has particularly deſcribed. (See Cook's Third Voyage, vol. iii. p. 406.) This empire has been called by Marco Polo Zipangri, or Zipangu; by the inhabitants themſelves, Nipon, Niphon, or Niſon; and by the Chineſe Sippon, and Jepuen. The principal iſlands of which it conſiſts, omitting ſeveral of a ſmaller ſize, are, towards the S.W., *Kiuſiu* (called alſo Ximo, Saikokf, or the weſtern country), and Sikokf or Xicogo; N.E. of theſe Nipon or Niphon, the moſt important; and N. of Niphon, Jeſſo, Jedſo, or Chicha. The Japaneſe iſlands probably derive their original population from the Chineſe by way of Corea, though their languages are radically diſtinct. It appears from Kæmpfer's account, that the Japaneſe themſelves acknowledge their government and civilization to have been derived from China. This author diſtinguiſhes three epochs in their hiſtory; the fabulous, the doubtful, and the certain. The latter period commences with the hereditary ſucceſſion of the eccleſiaſtical emperors, from the year 660 before the Chriſtian era, and extends to the year of Chriſt 1585, during which 107 princes of the ſame lineage governed Japan. At the laſt period the ſecular princes aſſumed the ſupreme authority. The ſeveral reigns are generally pacific, though at diſtant intervals the Mandſhurs and Coreans occaſionally invaded Japan, but were always defeated by the valour of the Japaneſe. An attempt was made in the reign of Gouda by the Moguls, to make a grand invaſion of Japan, after having conquered China about fourteen years before. But the formidable fleet, conſiſting, according to exaggerated report, of 4000 ſmall veſſels, which contained an army of 240,000 men, was diſperſed by a furious tempeſt, which the Japaneſe devoutly aſcribed to the gods, their protectors.

The religion of the Japaneſe is Polytheiſm, intermixed with an acknowledgment of a ſupreme creator. Their two principal ſects are thoſe of "Sinto" and of "Budſdo." The firſt acknowledges a ſupreme being, far ſuperior to the worſhip of man, and they therefore adore the inferior deities as mediators. They believe that the ſouls of the virtuous have a place aſſigned them immediately under heaven, while thoſe of the wicked wander in the air till they expiate their offences. They abſtain from animal food, deteſt bloodſhed, and will not touch any dead body. Thunberg further ſays, that though it is unneceſſary on any occaſion to pray to the gods, whom they call "Sin," or "Kami," becauſe they know all things, they have both temples and certain ſtated holidays. Theſe temples conſiſt of ſeveral apartments and galleries, with windows and doors in front, which may be taken away and replaced at pleaſure, according to the cuſtom of the country. The floors are covered with ſtraw mats, and the roofs overhang an elevated path, in which people walk around the temples. In theſe temples there is no viſible idol or image for repreſenting the ſupreme inviſible being; but they ſometimes keep a little image in a box, which repreſents ſome inferior divinity to whom the temple is conſecrated. In the centre of the temple is often placed a large mirror of well poliſhed metal, deſigned to remind thoſe that come to worſhip, that in like manner as their perſonal blemiſhes are faithfully pourtrayed in the mirror, ſo do the ſecret blemiſhes and evil qualities of their hearts lie open and expoſed to the all-ſearching eyes of the immortal gods. The prieſts are either ſecular or monaſtic. Their feſtivals and modes of worſhip are cheerful and gay, for they regard the gods as beings who ſolely delight in diſpenſing happineſs. The firſt day of the month is always kept as a holiday; ſo is the firſt day of the year: and beſides theſe they have three or four other grand feſtivals. There are alſo ſeveral orders of monks and nuns.

The ſect of "Budſdo," which is the ſame with that of Budha, or *Boodh* (which ſee), was imported from Hindooſtan; and paſſing through Chini and Corea, its tenets have been blended with foreign maxims; but the doctrine of the metempſychoſis remains; wicked ſouls being ſuppoſed to migrate into the bodies of animals, till they have undergone a due purgation.

The doctrine of their philoſophers and moraliſts, called "Shuto," reſembles the Epicurean, though it is blended with the tenet of Confucius, that the pureſt ſource of pleaſure is a virtuous life. This ſect admits a ſoul of the world; but does not allow infinite gods, temples, or religious forms.

Soon after this country was diſcovered by the Portugueſe, miſſionaries from the Jeſuits arrived in 1549, and they and their ſucceſſors continued to diffuſe their doctrine till 1638, when 37,000 Chriſtians were maſſacred. Before this period various perſecutions had occurred; and in 1590 upwards of 20,000 are ſaid to have periſhed. The Chriſtian faith has, indeed, been ſo perverted and diſgraced by the pride and avarice of the Portugueſe, and the vain ambition of the Jeſuits, that ſince the above-mentioned memorable epoch, Chriſtianity has been held in the greateſt deteſtation; and the croſs, with its other ſymbols, are annually trampled under foot; nevertheleſs, it is a fable that the Dutch are conſtrained to join in this ceremony.

As to the government of Japan, the "Kubo," or ſecular emperor, is now the ſole monarch; but till near the cloſe of the 17th century the "Dairis," pontiffs or ſpiritual monarchs, held the ſupreme authority. The ſecular prince, in concurrence with the Dairi, confers two honorary ranks, correſponding to thoſe of our noblemen and knights. The Dairi reſides at Miaco, and his court remains, though not in its former ſplendour. Each province is governed by a reſident prince, who is reſponſible to the emperor for his adminiſtration. The emperor derives his chief revenue from his own eſtate, conſiſting of five inferior provinces and ſome detached towns. Each prince enjoys the revenues of his fief, with which he ſupports his court and military force, repairs the roads, and defrays every civil expence. The princes of the firſt dignity are ſtyled "Daimio," and thoſe of inferior rank "Siomio:" and they are generally hereditary. Upon the whole we may obſerve, that the conſtitution of Japan conſiſts of an abſolute hereditary monarchy, ſupported by a number of abſolute hereditary princes; whoſe jealouſy of each other's power conſpires with domeſtic pledges to render them ſubſervient to the ſupreme head. The laws, according to Thunberg, are few, but rigidly and impartially enforced. The code is written in large letters, and poſted up in every town and village. Death is the common puniſhment of crimes, but ſentence of death muſt be ſigned by the privy council at Jeddo. Parents and relations are anſwerable for the crimes of thoſe whoſe moral education they ought to have ſuperintended. The police is excellent; each town having a chief magiſtrate, and each ſtreet a commiſſary, elected by the inhabitants to guard property and tranquillity. Two inhabitants alternately patrole the ſtreets by night to prevent fire.

The population of the Japaneſe empire, which is very conſiderable, is not eaſily aſcertained. Its regular military force is eſtimated at about half a million, the infantry being 468,000, and the cavalry 58,000, and if the army be doubled, the population may be ſtated at a million: but it may be more exactly deduced from ſuppoſing that it is equal to that of China; and as the former country is only about one-tenth part of the ſize of the latter, the whole number of people will be about 30,000,000. The character of the people is ſingularly brave and reſolute. The navy ſcarcely deſerves notice. The Japaneſe veſſels are open at the ſtern, ſo that they cannot bear a boiſterous ſea. Spanberg, however, deſcribes two kinds of veſſels, one anſwering to Kæmpfer's, and another, which he calls buſſes, and in which, he ſays, they make their voyages to the neighbouring iſlands. As Japan conſiſts of iſlands, and is deſtitute of a navy, it can have no external political importance; but it has little to apprehend from any neighbouring power. The revenues of the empire may be ſtated at 28,340,000*l.* ſterling, beſides the provinces and cities that are immediately ſubject to the emperor, who, beſides theſe, has a conſiderable treaſure in gold and ſilver, depoſited in cheſts of 1000 taels, each being equal in value to a Dutch rix-dollar, or about 4*s.* 4*d.* Engliſh money.

The Japaneſe, with reſpect to their perſons, are well made, active, eaſy in their motions, and having ſtout limbs, though leſs ſtrong and athletic than the other northern inhabitants of Europe. The men are of a middling ſize, with yellowiſh complexions, though ſome few, eſpecially the women, are almoſt white. Their narrow eyes, very much ſunk in the head, and high eye-brows, reſemble thoſe of the Chineſe and Tartars. The eyes incline to black, and the eye-lids form in the great angle of the eye a deep furrow, which diſcriminates them from other nations. Their heads are generally large, their noſes, though not flat, rather thick and ſhort; their hair black, thick, and ſhining in conſequence of the uſe of oils. The mode of the men's head-dreſs is ſingular; the middle part of their heads, from the forehead very far back, is cloſe ſhaven. The hair remaining round the temples and nape of the neck is turned up and tied on the top of the head into a kind of bruſh, which is lapped round with white thread and bent backwards. The women preſerve all their hair, and, drawing it together on the top of the head, roll it round a loop, and faſtening it down with pins, to which ornaments are fixed, draw out the ſides till they appear like little wings, behind which they ſtick a curl. Phyſicians and prieſts ſhave the head entirely, and are thus diſtinguiſhed from the reſt of the people. The faſhion of their clothes has undergone little alteration from remote antiquity. They conſiſt of one or more looſe gowns, tied about the middle with a ſaſh; thoſe of the women being much longer than the men's; in ſummer they are very thin, and in winter quilted with ſilk or cotten wadding. Perſons of rank have them made of ſilk; and thoſe of the lower claſs of cotton ſtuffs. Thoſe of the women are ornamented with gold and ſilver flowers woven into the ſtuff. At the breaſt theſe gowns are open, and they have wide ſleeves, which ſerve as pockets. Some uſe drawers; but their legs are naked. They wear ſandals of rice-ſtraw; in winter they have ſocks of linen, and in rainy or dirty weather wooden ſhoes. They never cover their heads except when they travel, and then uſe conical caps made of ſtraw: for defending themſelves againſt the rain or ſun, they uſe fans or umbrellas. In their ſaſh they faſten the ſabre, fan, and to bacco-pipe. Their houſes are built with upright poſts, croſſed and wattled with bamboo, plaiſtered within and without, and white-waſhed. They are generally of two ſtories; the roofs are covered with large and heavy pantiles: the floors are covered with planks, on which they lay mats, filled with ſtraw. The whole houſe conſiſts of one large room, divided by wooden partitions; and their windows are frames of wood, ſeparated into ſquares, filled up with thin white paper, and ſufficiently tranſparent to anſwer the purpoſe of glaſs. In their rooms they have no kind of furniture; not even beds. Their cuſtom is to lie down upon their heels on the mats, which are always ſoft and clean. Their victuals are ſerved up on a low board, raiſed a few inches from the floor, and only one diſh at a time. They have mirrors, made of a compound metal, which they uſe only at their toilets. In the ſeverity of winter, they are obliged to warm their houſes from November to March; but they have neither fire-places nor ſtoves; inſtead of theſe they uſe copper-pots ſtanding upon legs; theſe are lined on the inſide with loam, on which are laid aſhes, and upon them lighted charcoal, ſo prepared as not to render its fumes dangerous. The uſe of tobacco, probably firſt introduced by the Portugueſe, is very common among both ſexes, both old and young; and the ſmoke is blowed out through the noſtrils. The firſt compliment offered to a ſtranger in their houſes is a diſh of tea and a pipe of tobacco. Their pipes have mouth-pieces and bowls of braſs, or white copper. The hollow of the bowl is ſo ſmall as ſcarcely to contain an ordinary pea; and the tobacco is cut as fine as a hair about a finger's length; and is rolled up in ſmall balls like pills, to fit the ſmall hollow in the bowl of the pipe. Every houſe has a bath, which, as the people are very cleanly, is daily uſed by the whole family. You ſeldom meet a man, who has not his diſtinguiſhing mark imprinted on the ſleeves and back of his clothes, in the ſame colour in which the pattern is printed. Their uſage of names differs from that of all other nations. The family name is never made uſe of, except in ſigning ſolemn contracts, and the particular names by which individuals are diſtinguiſhed in converſation varies according to the age or ſituation of the perſon who makes uſe of it; ſo that in ſome caſes, the ſame perſon, in his life-time, is known by five or ſix different names. They reckon their age by even years, not regarding whether they were born at the beginning or the end of a year. In general, the Japaneſe are a highly civilized people, diſplaying great diverſity of character; but their virtues far outweigh their vices. Obedience to parents and reſpect to ſuperiors form the characteriſtic of this nation. Their ſalutations, or mutual intercourſe among equals, are diſtinguiſhed by civility and politeneſs; and to theſe childern are early accuſtomed by the example of their parents. Their pride is uſeful, as it prevents their ſtooping to the mean tricks of the maritime Chineſe. Though polygamy be allowed, they acknowledge only one wife; the others being merely concubines. Marriages are conducted by the parents or relations; and domeſtic tranquility is inſured by the wife's being under the abſolute diſpoſal of her huſband, the laws allowing her no kind of claim if ſhe incurs his diſpleaſure. Examples of infidelity are rare. In caſe of ſeparation, the wife is condemned to the ignominy of having her head always ſhaven. The marriage ceremony is always performed before an altar, by the bride's lighting a torch, from which the bridegroom kindles another. The bodies of the diſtinguiſhed dead continue to be burned, while others are buried. Periodical viſits are paid to the tombs, beſides the feſtival of lanthorns, held as in China, in honour of the departed. As to food and ſauces thoſe of the Japaneſe are very various. Their general drink is "Sarki," or beer made of rice, which laſt article ſupplies the place of bread. They uſe many kinds of vegetables and fruits. Tea is univerſally uſed; but wine and ſpirituous liquors are unknown. The Japaneſe feſtivals, games, and theatrical amuſements, equal thoſe of the moſt civilized nations. Dancing girls are common; and the introduction of boys indicates an abominable propenſity here, as in China, neither reputed a crime nor a ſingularity.

The language of the Japaneſe, of which Thunberg has publiſhed a curious vocabulary, ſeems to have little connection with the monoſyllabic ſpeech of the Chineſe. In ſciences and literature the Japaneſe are not inferior to few of the oriental nations. In domeſtic economy, deemed here a ſcience, and alſo in the hiſtory of his country, every perſon in Japan excels. Aſtronomy is cultivated, but to no very important and uſeful purpoſe. The art of printing is of ancient uſage, but they uſe blocks and not moveable types, and impreſs only one ſide of the paper. They are excellent workmen in iron and copper; and yield to none in manufactures of ſilk and cotton, and in the art of varniſhing wood. Glaſs is common, and they make teleſcopes. The porcelain is deemed ſuperior to that of China. Their celebrated varniſh is obtained from the "rhus vernix." They have many varieties procured from the bark of a ſpecies of mulberry tree; and their woods diſplay incomparable ſkill. They have many ſchools, in which the children are taught to read and write; and their education is accompliſhed without perſonal chaſtiſement, while courage is inſtilled by the repetition of ſongs in praiſe of deceaſed heroes.

Although the mountains of Japan prevent the formation of canals, their roads are kept in excellent order, and the proximity of the ſea renders inland navigation almoſt unneceſſary. Their inland commerce, being free from impoſts, is very conſiderable; and their external commerce, though confined to the Dutch and Chineſe, is extenſive. The harbours are crowded with large and ſmall veſſels; the high roads with various goods; and the ſhops are well repleniſhed. Large fairs are held in different places, to which a great multitude of people reſort. Their trade with China is the moſt important, and conſiſts of raw ſilk, ſugar, turpentine, drugs, &c. while the exports are copper in bars, lacquered ware, &c. The Dutch export copper and raw camphire, for which they give in return ſugar, ripe cloves, Japan wood, ivory, tin, lead, tortoiſe-ſhell, chintzes, and a few other trifles. In their intercourſe both with the Dutch and Chineſe, they trade with companies of privileged merchants. As the Dutch company have not been accuſtomed to pay duty in Japan, either on their exports or imports, they uſed to ſend an annual preſent to the court, conſiſting of cloth, chintzes, ſuccotas, cottons, ſtuffs, and trinkets. Thunberg repreſents the profits of the Dutch trade as very inconſiderable, ſo that the company employed only two ſhips. The Japaneſe coin is of a remarkable form: the gold being called "Kobango," the ſilver, called "Kodama," ſometimes repreſents "Daikok," the god of riches, ſitting upon two barrels of rice, with a hammer in his right hand, and a ſack at his left. The "Seni" of copper or iron, are ſtrung like the Chineſe pieces of ſimilar value.

The climate of Japan is variable. In ſummer the heat is violent, and if it were not moderated by ſea-breezes, would be intolerable. The cold in winter is ſevere. The falls of rain commence at Midſummer, and to theſe Japan owes its fertility, and alſo its high ſtate of population. Thunder is not unfrequent: tempeſts, hurricanes, and earthquakes, are very common. From Thunberg's thermometrical obſervations it appears that the greateſt degree of heat at Nagaſaki, was 98° in Auguſt, and the ſevereſt cold in January 35°. The face of the country preſents, beſides ſome extenſive plains, more generally mountains, hills, and valleys; the coaſt being moſtly rocky and precipitous, and inveſted with a turbulent ſea. It is alſo diverſified with rivers and rivulets, and many ſpecies of vegetation. The ſoil, though barren, is rendered productive by fertilizing ſhowers and manure, and by the operations of agricultural induſtry. Agriculture, as Thunberg informs us, is here well underſtood, and the whole country, even to the tops of the hills, is cultivated. Free from all feudal and eccleſiaſtical impediments, the farmer applies himſelf to the culture of the ſoil with diligence and vigour. Here are no commons, and it is a ſingular circumſtance, that if any portion be left uncultivated, it may be ſeized by a more induſtrious neighbour. The Japaneſe mode of manuring is to form a mixture of all kinds of excrements, with kitchen refuſe, which is carried in pails into the field, and poured with a ladle upon the plants, when they have attained the height of about ſix inches, ſo that they thus inſtantly receive the whole benefit. They are alſo very attentive to weeding. The ſides of the hills are cultivated by means of ſtone walls, ſupporting broad plats ſown with rice or eſculent roots. Rice is the chief grain: buck-wheat, rye, barley, and wheat being little uſed. A kind of potatoe (convolvulus edilis) is abundant with ſeveral ſorts of beans and peas, turnips, cabbages, &c. From the ſeed of a kind of cabbage lamp oil is expreſſed; and ſeveral plants are cultivated for dyeing; with the cotton ſhrubs, and mulberry trees for the food of ſilk-worms. The varniſh and camphire trees, the vine, the cedar, the tea tree, and the bamboo reed, not only grow wild, but are planted for numerous uſes.

The principal rivers of Japan are the Nogaſa, Jedoguva, Ojingawa, Fuſigawa, Sakgawa, Jodo or Yodo, Ujin or Ojin, Oomi, and Aſka. One of the chief lakes is that of Oitz, ſaid to be 50 Japaneſe leagues in length, each about an hour's journey on horſeback, but of inconſiderable breadth. From it flows two rivers; and near it is the delightful mountain of Jeſan, which is eſteemed ſacred, and is ſaid to preſent not leſs than 3000 temples. The principal Japaneſe mountain is that of Fuſi, covered with ſnow almoſt throughout the year. The Fakonie are in the ſame quarter, ſurrounding a ſmall lake of the ſame name. Many of the mountains are covered with wood. There are ſeveral volcanoes; and they generally abound with evergreen trees, and cryſtalline ſprings. Near Firando there is a volcanic iſland; and in the province of Figo there is a volcano, which conſtantly emits flames, and another, which was formerly a coal-mine, in the province of Tſikuſer.

In the whole empire of Japan there are neither ſheep nor goats; and, in general, there are but few quadrupeds. The food of the Japaneſe conſiſts almoſt entirely of fiſh and fowl, with vegetables. Some few dogs are kept from motives of ſuperſtition; and cats are favourites of the ladies. Hens and common ducks are domeſticated for the ſake of their eggs. The mineralogy of Japan has been particularly ſtated by Thunberg: from whom we learn, that gold and ſilver are to be found in abundance; copper is alſo quite common: but iron is ſcarcer than any other metal in this country. Of that which is found they manufacture ſcymitars, arms, ſciſſors, knives, and other neceſſary implements. Amber, brimſtone, pit-coal, agate, aſbeſtos, porcelain clay, fleſh-coloured ſteatite, pumice, and white marble are enumerated among the productions of Japan. Many ſmall iſles are dependents on this empire, particularly in the S. and E.; among which is Fatſiſio, the place of exile for the grandees. For other particulars we refer to Kæmpfer, Thunberg, Phil. Tranſ. vol. lxx. and Pinkerton's Geography, vol. ii.

JAPAN *Earth*. (See CATECHU.) The extract prepared in the manner, ſtated under that article, is much uſed by the natives of Hindooſtan in dyeing and painting chintz and other cloths: combined with the vitriolic ſalts, a black colour is produced: mixed with oil they paint the beams and walls of houſes to preſerve them, and to defend them from the deſtructive white ants; and it is ſometimes mixed with their wall-plaiſter. The extract is uſed only medicinally as a cooling medicine, and when too profuſely uſed, it is ſaid to be a deſtroyer of venereal pleaſures. It is alſo given at the rate of two ounces a day to tame vicious horſes. This extract is likewiſe a principal ingredient in one of their ointments, of great repute, compoſed of blue vitriol, four drams; Japan earth, four ounces; alum, nine drams; white reſin, four ounces; which are reduced to a fine powder, and mixed with the hand, adding of olive oil ten ounces, and water ſufficient to bring the maſs to the proper conſiſtence of an ointment: this ointment is uſed in every ſore from a freſh wound to a venereal ulcer. Med. Obſ. and Inq. vol. v. art. 16. The antiſeptic quality of catechu appears from the experiments of ſir John Pringle.

The London college formerly directed Japan earth to be made into troches by beating it with an equal weight of gum arabic, and four times the weight of both, of ſugar of roſes, and a ſufficient quantity of water: but the college of Edinburgh ordered one part of the Japan earth, four of gum tragacanth, and twenty-four of fine ſugar, with roſe-water. The *tictura Japonica*, or *tinctura Catechu*, is prepared by digeſting, for fourteen days, three ounces of the extract of catechu, and two of cinnamon bark bruiſed, in a quart of proof ſpirit; and this tincture may be given in doſes of two or three ſpoonfuls. The infuſion of catechu is prepared by macerating for an hour in a covered veſſel 2½ drams of the extract, half a dram of bruiſed cinnamon bark, in half a pint of boiling water. This is one of the beſt forms in which catechu can be exhibited, as it is thus at once freed from its impurities, and improved by the addition of the aromatic. For the method of preparing Japonic confection, ſee CONFECTION. Japan earth diſſolved in water is of a full brown colour, a little inclined to red. It is ſometimes uſed in water-painting, where it has a good effect; but its gummy texture renders its uſe improper in oil.

JAPANNERS GILDING. See GILDING.

JAPANNING, the art of varniſhing, and drawing figures on wood, &c. after the ſame manner as the workmen do who are natives of Japan.

The varniſh made and uſed in China and Japan is compoſed of turpentine, and a curious ſort of oil they have. This they mix and boil up to a proper conſiſtence, and this never cauſes any ſwelling in the hands or face of the people who uſe it. The ſwellings in theſe parts, which often happen to thoſe who work the lacquered ware, and ſometimes to thoſe who only paſs by the ſhops of theſe people, is from the lack, and not the varniſh. This lack is the ſap or juice of a tree, which runs ſlowly out on cutting the lower part of the trunk of the tree, and is received in pots ſet on purpoſe under the inciſions. The juice, as it flows from the tree, is of the colour and conſiſtence of cream; and as it comes in contact with the external air, its ſurface becomes black. As they only uſe it when black, their method of preparing it is to ſet it out in the open air, in large flat bowls, in which it looks all ſurface; but that the whole may be of the ſame uniform colour, they continually ſtir it for twenty-four hours together, with a ſmooth piece of iron. By this means the whole becomes thicker than it was before, and of a fine deep black. When it is in this ſtate, they powder ſome burnt boughs of trees, and mix them thoroughly with it; and then ſpreading it thin over any board which they intend to japan, it is ſoon dried in the ſun, and is then abſolutely harder than the board it is laid on. When this is thoroughly dry, they poliſh it over with a ſmooth ſtone and water, till it is as ſmooth as glaſs; and then wiping it very dry, they lay on the varniſh, made of oil and turpentine, and boiled to a proper conſiſtence for this kind of work.

If the work is to be of any other colour than black, that colour is to be mixed with the varniſh, and then the whole ſpread on very thinly and evenly; for on this laying it on depends the principal art of varniſhing. When there are to be figures in gold and ſilver, theſe muſt be traced out with a pencil in the varniſh over the reſt of the work; and when this varniſh is almoſt dry, the leaf-gold or leaf-ſilver is to be laid on, and poliſhed afterwards with any ſmooth ſubſtance.

The ſubſtances which admit of being japanned are almoſt thoſe of every kind that are dry, and not too flexible; as wood, metals, leather, and paper prepared. Wood and metals require no other preparation, except that of cleaning their ſurfaces, and rendering them perfectly even. But leather ſhould be ſecurely ſtrained either on frames or on boards; and paper ſhould be treated in the ſame manner, and have a previous ſtrong coat of ſome kind of ſize; but it is rarely made the ſubject of japanning, till it is converted into *papier maché*, or wrought, by other means, into an inflexible form. One principal variation in the manner of japanning is the uſing or omitting any priming or under-coat on the work to be japanned. In the older practice, ſuch priming was always uſed; and is at preſent retained in the French manner of japanning coaches and ſnuff-boxes of the *papier maché*. But in the Birmingham manufacture it has always been rejected. The advantages attending the uſe of ſuch priming are, that it makes a ſaving in the quantity of varniſh neceſſary to be uſed, and that it helps to form, by means of rubbing and water-poliſhing, an even ſurface for the varniſh. However, when an under-coat of ſize is uſed, the japan coats of varniſh and colour will be always liable to crack and peel off, and are leſs durable than thoſe which are formed without ſuch priming. This difference is obſervable in comparing the wear of the Paris and Birmingham ſnuff-boxes.

The laying in of the colours in varniſh or oil inſtead of gum-water, is another variation from the method of japanning formerly practiſed. But if the colours are tempered with the ſtrongeſt iſinglaſs ſize and honey, inſtead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will laſt as long as the common old japan work, the beſt kinds of the true japan excepted. The proper japan grounds are either ſuch as are formed by the varniſh and colour, where the whole is to remain of one ſimple colour; or by the varniſh, either coloured, or without colour, on which ſome painting, or other decoration, is afterwards to be laid. The priming, or under-coat, which is ſometimes uſed in japanning, is of the ſame nature with that called clear-coating, practiſed by the houſe-painters; and conſiſts in laying on and drying in the moſt even manner a compoſition of ſize and whiting. The common ſize, (ſee SIZE,) has been generally uſed; but in nicer works, the glovers or the parchment ſize, improved by adding a third of iſinglaſs, will be preferable. The work ſhould be prepared for this priming, by being well ſmoothed with fiſh-ſkin, or the glaſs-ſhaver; and by being bruſhed over once or twice with hot ſize diluted, when it is of the common ſtrength, with two-thirds of water. The priming, formed of a ſize whoſe conſiſtence is between that of the common kind and glue, mixed with as much whiting as will give it a ſufficient body of colour to hide the ſurface on which it is laid, ſhould be laid on evenly with a bruſh. Two coats of this priming will generally be ſufficient; but if, upon trial with a fine wet rag, it will not receive a proper water-poliſh, another coat or more muſt be given it. And after the laſt coat but one is dry, the work ſhould be ſmoothed by rubbing it with the Dutch ruſhes. When the laſt coat is dry, the water-poliſh ſhould be given, by paſſing over every part of it with a fine rag, a little moiſtened, till the whole appears perfectly plain and even. The work is then ready to receive the painting or coloured varniſh.

When wood or leather is to be japanned, without priming, it may be prepared by laying on two or three coats of coarſe varniſh, made by diſſolving two ounces of ſeed-lac, and as much roſin, in one pint of rectified ſpirit of wine: and then the proper japan-ground muſt be laid on. As metals never require to be under-coated with whiting, they muſt generally be treated in the ſame manner as wood or leather.

For white japan grounds.—Prepare a white varniſh, by working and grinding flake white, or white lead, with a ſixth part of its weight of ſtarch, and drying the mixture; then temper it into a conſiſtence fit for ſpreading with maſtic varniſh, (ſee VARNISH,) or compound it with gum anime; lay this on the body to be japanned, previouſly prepared with or without the under-coat of whiting: and varniſh it over with five or ſix coats of the following varniſh, formed by diſſolving two ounces of the cleareſt and whiteſt grains of ſeed-lac, and three ounces of gum anime, pulverized, in about a quart of ſpirit of wine, and ſtraining off the clear varniſh.

A very good varniſh, free from brittleneſs, may be obtained by diſſolving as much gum anime as the oil will take in old nut or poppy oil, boiled gently when the gum is put into it. The ground of white colour may be laid on in this varniſh, and then a coat or two of it may be put over the ground; but it muſt be well diluted with oil of turpentine when it is uſed.

Blue japan grounds may be formed of bright Pruſſian blue; or of verditer glazed over with Pruſſian blue, or ſmalt. The colour may be beſt mixed with ſhell-lac varniſh, and brought to a poliſhing ſtate by five or ſix coats of varniſh of ſeed-lac. But when a bright blue is required, and a leſs degree of hardneſs can be diſpenſed with, the method before directed, in the caſe of white grounds, muſt be purſued.

Red japan grounds.—For a ſcarlet ground, vermilion may be uſed: but this is leſs beautiful than the crimſon produced by glazing it over with carmine or fine lake, or roſe-pink. For a very bright crimſon; inſtead of glazing with carmine, the Indian lake, called ſafflower, ſhould be uſed, diſſolved in the ſpirit of which the varniſh is compounded. But in this caſe, inſtead of glazing with the ſhell-lac varniſh, the upper or poliſhing coats need only be uſed; which will render this a cheaper method than the uſing of carmine. If the higheſt degree of brightneſs be required, the white varniſhes muſt be uſed.

Yellow japan grounds.—For bright yellow grounds, king's yellow, or turpeth mineral ſhould be uſed, either by themſelves, or mixed with fine Dutch pink. The effect may be ſtill more heightened by diſſolving powdered turmeric root in the ſpirit of wine, of which the upper or poliſhing coat is made; which ſpirit of wine muſt be ſtrained off from the dregs, before the ſeed-lac be added to it for forming the varniſh.

Yellow grounds may likewiſe be formed of the Dutch pink only.

Green japan grounds may be produced by mixing king's yellow and bright Pruſſian blue; or turpeth mineral and Pruſſian blue. A cheap, but fouler kind may be had from verdigris with a little of the fore-mentioned yellows, or Dutch pink. But if a very bright green be wanted, the cryſtals of verdigris, called diſtilled verdigris, ſhould be uſed, and their effect will be heightened by laying them on a ground of leaf-gold. Any of theſe may be uſed with good ſeed-lac varniſh, but will be brighter with the white varniſh.

Orange-coloured japan grounds may be formed by mixing vermilion or red lead with king's yellow, or Dutch pink: or orange lake, or red orpiment will make a brighter orange ground than can be produced by any mixture.

Purple japan grounds may be produced by the mixture of lake and Pruſſian blue ; or a fouler kind, by vermilion and Pruſſian blue.

Black japan grounds may be formed, without heat, by either ivory-black, or lamp-black, which may be laid on with the ſhell-lac varniſh : and the upper or poliſhing coat may be common ſeed-lac varniſh.

For forming the common *black japan grounds* on iron or copper by means of heat, the work muſt be firſt painted over with drying oil, and a little lamp black ; and when it is moderately dry, put into a ſtove of ſuch a degree of heat, as will change the oil black, without burning it. The heat ſhould be ſlowly augmented and continued for a long time, in order to harden the coat of japan. This kind of varniſh requires no poliſh.

Tortoiſe-ſhell japan grounds.—The beſt is made by means of the following varniſh ; prepared by boiling together one gallon of good linſeed oil and half a pound of umbre, till the oil becomes very brown and thick ; by ſtraining the mixture through a coarſe cloth, and ſetting it again to boil, till it acquires the conſiſtence of pitch. On the piece of work to be japanned, well-cleaned, let vermilion, tempered with ſhell-lac varniſh, or with drying oil diluted with oil of turpentine, be laid thinly on the places deſigned to imitate the more tranſparent parts of the tortoiſe-ſhell.

When the vermilion is dry, bruſh over the whole with the black varniſh, tempered to a due conſiſtence with oil of turpentine ; and when it is ſet and firm, put the work into a ſtove, where it may undergo a very ſtrong heat, and be continued for a conſiderable time. This method, propoſed in one of Kunkel's recipes, has been revived in the Birmingham manufactures, where it is purſued in forming the ground of ſnuff-boxes, dreſſing boxes, tea-waiters, &c. This ground may be decorated with painting and gilding in the ſame manner as any other varniſhed ſurface.

Japan-work ought properly to be painted with colours in varniſh. (See PAINTING *in Varniſh* and VARNISH.) The colours are now moſt frequently tempered in oil, having a fourth part of its weight of gum anime previouſly diſſolved in it. This oil ſhould be well diluted with ſpirit of turpentine when it is uſed, that the colours may be laid more evenly and thin, and thus fewer of the poliſhing coats of varniſh will be neceſſary. When water-colours are laid on grounds of gold, ſo as to have the effect of emboſſed work, they are beſt prepared by means of iſinglaſs ſize corrected with honey or ſugar-candy. The body of which the emboſſed work is raiſed may be formed of a very ſtrong gum-water, thickened to a proper conſiſtence by bole armeniac and whiting, in equal parts, which being laid on in the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the iſinglaſs ſize, or in the general way with ſhell-lac varniſh.

The finiſhing part of japanning conſiſts of laying on and poliſhing the outer coats of varniſh. This is in general beſt done with common ſeed-lac varniſh. (See VARNISH.) But where brightneſs is principally regarded, the ſeed-lac muſt give way to the whiter gums. When hardneſs, tenacity, and brightneſs are deſired, the mixed varniſh made of the picked ſeed-lac, already propoſed under *white Japan grounds*, ſhould be adopted. The pieces of work to be varniſhed ſhould be placed near a fire, and made perfectly dry ; the varniſh ſhould then be rubbed over them with proper bruſhes ; firſt one coat, and when this is dry another ſhould be laid over it ; and this operation muſt be continued at leaſt five or ſix times. When a ſufficient number of coats is thus laid on, the work is fit to be poliſhed, which muſt be done, in common caſes, by rubbing it with a rag dipped in tripoli, commonly called rotten-ſtone, finely powdered ; but toward the end of the rubbing, a little oil of any kind ſhould be uſed with the powder : and when the work appears ſufficiently bright and gloſſy, the oil alone ſhould be uſed to clear it from the powder, and to give it a brighter luſtre. For white grounds, fine putty or whiting ſhould be uſed inſtead of the tripoli. For gilding of Japan work, ſee *Japanners* GILDING. Handmaid to the Arts, vol. ii. p. 497, &c.

JAPARA, in *Geography*, a ſea-port town of the iſland of Java, ſituated on a peninſula on the N. coaſt ; the harbour is formed by a river of the ſame name, and is capable of receiving a great number of ſhips. The Dutch have a reſident here for the purchaſe of timber, cotton, rice, and indigo. About four miles S. from this town is the ancient city of Japara, once the capital of a kingdom. Not far from this is an old and ruinous Mooriſh temple of ſtone, with beautiful ſculpture of imagery and foliage : this temple is more than 300 years old. S. lat. 6° 28′. E. long. 110° 54′.

JAPENE, a town of Africa, in the kingdom of Jagra.

JAPHA, in *Ancient Geography*, a city of Galilee, near Jotapata, according to Joſephus ; probably the ſame with Japhia (Joſh. xix. 12.) belonging to the tribe of Zebulun. It was ſtrongly fortified ; and was beſieged and taken by Trajan, the father of the emperor of this name, who maſſacred all the inhabitants who were capable of bearing arms, and made ſlaves of the women and children, A.D. 67. See JOPPA.

JAPHETH, in *Scripture Biography*, the eldeſt ſon of Noah, who was born in the 500dth year of this patriarch, and who had ſeven ſons, *viz.* Gomer, Magog, Madai, Javan, Tubal, Meſhech, and Tiras, who “ peopled the iſles of the Gentiles, and ſettled in different countries, each according to his language, family, and people.” (Gen. x. 5.) By the “ iſles of the Gentiles,” the Hebrews underſtood the iſles of the Mediterranean, and other countries whither they could go by ſea only, as Spain, Gaul, Italy, Greece, and Aſia Minor ; and with reſpect to theſe ſeven ſons of Japheth it is very generally ſuppoſed that Gomer was the father of the Cimbri, or Cimmerians ; Magog of the Scythians ; Madai of the Macedonians or Medes ; Javan of the Ionians and Greeks ; Tubal of the Tiburenians ; Meſhech of the Muſcovites or Ruſſians ; and Tiras of the Thracians. From the LXX, Euſebius, the Alexandrian Chronicle, and Auſtin, we learn that Japheth had an eighth ſon called Eliza.

The portion of Japheth was Europe and part of Aſia, whoſe deſcendants poſſeſſed all Europe, all the iſlands in the Mediterranean, the whole of Aſia Minor, and the northern parts of Aſia. Noah, in his benediction of Japheth, propheſies concerning him (Gen. ix. 27.), “ God ſhall enlarge Japheth ; and he ſhall dwell in the tents of Shem ; and Canaan ſhall be his ſervant.” This prediction was accompliſhed when the Greeks and Romans, who were deſcendants of Japheth, not only ſubdued Syria and Paleſtine, but alſo purſued and conquered ſuch of the Canaanites as were any where remaining, as, *e. g.* the Tyrians and Carthaginians, the former of whom were received by Alexander and the Grecians, and the latter by Scipio and the Romans. In the original of the prediction, “ God ſhall enlarge Japheth,” there is a manifeſt alluſion to his name, which ſignifies enlargement. This was fulfilled both with regard to the territory and children of Japheth. The territories of Japheth's poſterity were very large ; for beſides all Europe, extenſive as it is, they poſſeſſed the Leſſer Aſia, Media, part of Armenia, Iberia, Albania, and thoſe vaſt regions towards the north, which anciently the Scythians inhabited, and which now the Tartars inhabit ; and it is not improbable that the new world was peopled by ſome of his northern deſcendants paſſing thither by the ſtraits of Anian. The enlargement of Japheth alſo denoted a numerous progeny, as well as ample territory; for Japheth, as we have obſerved, had ſeven ſons, whereas Ham had only four, and Shem only five.

In profane authors Japheth is known under the name of "Japetus," who is made by the poets father of heaven and earth; whoſe habitation was in Theſſaly, where he became celebrated for his power and violence. Japetus married a nymph named Alia, by whom he had four ſons, Heſperus, Atlas, Epimetheus, and Prometheus, who were all very famous among the ancients. Neptune is alſo, among ancient mythologiſts, a memorial of Japheth. As Noah divided the earth between Shem, Ham, and Japheth, Saturn divided the world between his three ſons, Jupiter, Pluto, and Neptune.

JAPONIC Confection. See Confection.

JAPU, in *Ornithology*, the name of a Braſilian bird, of the woodpecker kind, called alſo *jupujuba*. See Oriolus *perſicus*.

JAQUARIPE, in *Geography*, a river of Braſil, which runs into the Atlantic, S. lat. 4°.

JAQUE-LAHOU, a town of Africa, on the Ivory coaſt; 20 miles E. of cape Lahou.—Alſo, a river of Africa, which runs into the Atlantic, N. lat. 5° 20′. W. long. 5° 5′.

JAQUEJAG, a town of Africa, on the Ivory coaſt; 43 miles E. of cape Lahou.

JAQUEMEL, a town of Hiſpaniola, on the S. coaſt, in a bay to which it gives name. N. lat. 18° 17′.

Jaquemel, *Cape*, a cape on the S. coaſt of the iſland of Hiſpaniola. N. lat. 18° 14′. W. long. 73° 25′.

JAQUES, Cape, a cape on the coaſt of Chiampa, at the mouth of the river Cambodia. N. lat. 10° 40′. E. long. 107° 30′.

Jaques, or *Jaſk*, *Cape*, a cape at the weſtern extremity of the gulf of Perſia, at its entrance from the Arabian ſea. This is known by a remarkable ſquare rock, a few miles N. of it. It is a low ſandy deſert, with a few ſhrubs on it; and it is called by Le Brun cape St. James. N. lat. 25° 39′. E. long. 57° 20′.

Jaques, *St.*, a town of Mexico, in the province of Vera Paz.

JAQUESY, a town on the N. coaſt of Hiſpaniola; 13 miles E.S.E. of cape François.

JAQUET, Cape, a cape on the coaſt of Guzerat, in the gulf of Cutch. N. lat. 23°. E. long. 69′.

JAR, or Jarr, from the Spaniſh, *jarra*, or *jarro*, which ſignify the ſame, an earthen pot or pitcher, with a big belly, and two handles.

Jar is uſed for a ſort of meaſure, or fixed quantity of divers things.—The jar of oil is from 18 to 26 gallons: the jar of green-ginger is about 100 pounds weight, of wheat 52 pounds.

Jar, a meaſure of Lucca oil is 25 wine-gallons = 5775 cubic inches = 3.3420 cubic feet = .12378 cubic yards = 11.62456 cubic links.

Jar, or *Jiar*, in *Chronology*, one of the Hebrew months, anſwering to our April. It was the eighth month of the civil year, and the ſecond of the ſacred, and had only 29 days. On the 23d day of this month the Jews kept a feſtival in memory of the purification of the temple by Judas Maccabæus. (2 Mac. xiii. 51.) On the 25th they mourn the death of Samuel.

Jar. *To jar* is a verb which implies to diſagree, to ſound harſhly and untunably.

Jar, for meaſuring muſical intervals by water. See Hyppasus.

JARA, in *Geography*, a town of Syria, in the pachalic of Damaſcus; 15 miles E. of Safet.—Alſo, a town of Sweden, in the province of Smaland; 10 miles S.W. of Jonkioping.

JARAMEY, an inland town of Africa, in the kingdom of Yani.

JARAMOTH. See Ramoth.

JARANI, a town of Dalmatia; 10 miles S.E. of Macarſca.

JARARA-COAYPITINGA, in *Zoology*, the name of a ſpecies of ſerpent found in America, not much unlike the common viper, and equally venomous. Its tail is of a paler colour than the reſt of the body, and thence it has its name; which, in the language of the natives, expreſſes this property.

JARARA-EPEBA, the name of a ſpecies of American ſerpent, of a brown colour, but variegated by a very beautiful undulated red line, running all along the back like a chain. Ray.

JARARACA, the name of a ſpecies of ſerpent, common in America. It is a very ſhort ſerpent, ſeldom exceeding a foot and a half in length. It has ſome prominent veins on its head, and is of a duſky browniſh colour, variegated with red and black ſpots. It is a very poiſonous ſpecies. The natives uſe for a remedy the root of a plant called caatia, and by the Portugueſe herva de cobros. Ray.

De Laet has deſcribed four different ſpecies of this ſerpent.

JARARACUCU, the name of an American ſpecies of ſerpent. It is of the viviparous kind, and produces a great number of young; thirteen having been found perfectly formed in the body of a female of this kind; it grows to between two and three feet long, and has, like the other poiſonous ſerpents, very large and long teeth, which are hid in the gums, and contain a yellow poiſonous liquor. Theſe it only exerts at the time of biting, and its poiſon is ſo fatal that it will deſtroy a man within four and twenty hours. Ray.

JARBARRY, in *Geography*, a town of Hindooſtan, in Bengal; 20 miles N. of Dinagepour. N. lat. 25° 58′. E. long. 88° 40′.

JARBO, a town of Sweden, in Weſt Gothland; 25 miles N. of Uddevalla.

JARBOAS, a town of Sweden, in Weſtmanland; 45 miles W.N.W. of Stroemſholm.

JARCHI, Solomon Ben, in *Biography*, a famous rabbi, was born at Troyes, in Champagne, in the year 1104. He is known in hiſtory by the ſurnames of Iſaaki, Iſarchi, and Raſchi, and was the ſon of a rich merchant and learned rabbi, named Iſaac, who was alſo at the head of a college founded at Troyes for the inſtruction of the Jews, in the languages, medicine, and theology. Solomon had the beſt education that could be given him, and when he had finiſhed his ſtudies he went on his travels for farther improvement. On his return, and when he had attained to his thirtieth year, he formed a plan, under the direction of his father, of writing a hiſtory of the Jews, from the period of the deſtruction of Jeruſalem. With this view he left his native city in 1133, and ſpent ſeven years in travelling through Italy, Egypt, Greece, Aſia Minor, Paleſtine, Armenia, and Perſia, to collect materials among the Jews themſelves, who had been diſperſed in all parts of the globe. In Egypt he met with the celebrated Maimonides, who adviſed him to relinquiſh the undertaking, and to leave the execution of it to more favourable times. On his return to Troyes, finding that his father was dead, and, perhaps, aware of the difficulties which he had to contend with, he followed the counſel of Maimonides, locked up his collections, and applied himſelf to give an illuſtration and commentary on the collections of Talmudical traditions. This work being received with great applauſe, he next publiſhed "Gloſſes on the Jeruſalem and Babyloniſh Talmuds;" and finally he wrote moral illuſtrations of the bible, which were printed in the great bibles of Venice and Baſil, and were inſerted in De Lyra's great work on the ſacred volume. Jarchi died at Troyes in 1180, in the 76th year of his age. He was buried with every mark of reſpect in the Jewiſh cemetery near that city, and when that nation was afterwards driven out of France, they carried his remains with them into Bohemia, and interred them at the Prague. He is mentioned by Reland as one of the beſt interpreters of ſcripture, who ſays, that when any difficulties occurred to him in the Hebrew text, the illuſtrations of rabbi Jarchi appeared more ſatisfactory to him than thoſe of the greateſt critic, or any other commentator. Moreri. Bayle.

JARDES, or Jardons, in the *Manege*, are callous and hard ſwellings in the hinder legs of a horſe, ſeated on the outſide of the hough, as the ſpavin is on the inſide. Jardons lame a horſe, unleſs you give the fire dexterouſly and betimes.

JARDIN, Karel du, in *Biography*, an agreeable painter of ſcenes in common life, in a ſtyle partaking of Berchem's and Wouverman's manners united. He was born at Amſterdam in 1640, and was a diſciple of N. Berchem; but finiſhed his ſtudies in Italy, where he ſpent the greater part of his life, and died at Venice in 1678.

The compoſitions of this maſter are ſimple. A few figures with a horſe or cattle, and a ſmall landſcape back-ground, generally compriſe the whole; and they are moſt uſually on a ſmall ſcale. His colour is rich and bright; and frequently very agreeable; expreſſing happily the glow and effect of ſun-ſhine; or the duller light of a lowering day. The defect of his works is ſomewhat of hardneſs in the touch, which, however, is very delicate and neat; and has great ſpirit and brilliancy.

JARDINES, Los, in *Geography*, ſmall iſlands and rocks near the ſouth coaſt of Cuba. N. lat. 21° 18'. W. long. 81° 50'.

JARDINS, Mary Catherine des, in *Biography*, a celebrated novel writer, was born at Alençon in 1640. An early adventure in gallantry having obliged her to quit her native town, ſhe went to Paris in her twentieth year, where ſhe ſoon became known as a dramatic writer and noveliſt. She alſo attracted the notice and engaged the affection of captain Villedieu, who was already married, but from whom ſhe took the name of madame de Villedieu, by which ſhe has been chiefly known. The ſudden death of a friend inſpired her with pious ſentiments, which cauſed her to retreat to a convent; but when it was known that her conduct had not been of the moſt correct kind ſhe was diſmiſſed. On her return to the world ſhe became acquainted with the marquis de la Chaſſe, and married him. She died in 1683. Her works were printed in a collective form, in twelve volumes, in the year 1702. They contain a number of novels, or ſhort romances, which were much read, and contributed to ſet aſide the long ſerious romances at that time in faſhion. She is one of thoſe writers who, by aſcribing fictitious adventures to known characters of antiquity, have ſo much contributed to confound truth and falſehood. Bayle.

JARECA, or Yareca, in *Geography*, a town of Syria, in the Deſert; 18 miles N.N.E. of Palmyra.

JARFSO, a town of Sweden, in Helſingland; 36 miles N.W. of Soderhamn.

JARGEAU, a town of France, in the department of the Loiret, and chief place of a canton, in the diſtrict of Orleans, ſituated on the Loire; 9 miles S.E. of Orleans. The place contains 2441, and the canton 7724 inhabitants, on a territory of 150 kiliometres, in 10 communes.

JARGEPOUR, a town of Hindooſtan, in the circar of Cuttack; 35 miles N.E. of Cuttack.

JARGON, in *Mineralogy*. See Zircon and Gems.

JARGONG, in *Geography*, a town of Hindooſtan, in Bengal; 18 miles S.W. of Midnapour.

JARGROD, a town of Poland, in the palatinate of Braclaw; 36 miles S.S.W. of Braclaw.

JARHISAR, a town of Aſiatic Turkey, in Natolia; 40 miles N.W. of Kiutaja. N. lat. 39° 43'. E. long. 30° 3'.

JARJARIA, a town of the Arabian Irak, on the Tigris; 60 miles S.S.E of Bagdad.

JARIBOLUS, Ιαριϐῶλος, in *Antiquity*, one of the Palmyrenian gods. This deity, in all appearance, had the ſame attributes with the God Lunus; for *Jari* ſignifies the month over which the moon preſides. Mem. Acad. Inſcrip. tom. iii. p. 177.

JARISZOW, in *Geography*, a town of Poland, in the palatinate of Braclaw; 56 miles S.W. of Braclaw.

JAR-KEVI, a town of Aſiatic Turkey, in Natolia; 30 miles S.W. of Augura.

JARLSBERG, a town of Norway, capital of a diſtrict, abounding in mines, in the dioceſe of Aggerhuus; 5 miles N. of Tonſberg.

JARMAN, a town of Africa, in Sahara. N. lat. 18° 57'. E. long. 6° 26'.

JARNA, a town of Sweden, in Dalecarlia; 35 miles W.S.W. of Fahlun.

JARNAC-CHARENTE, a town of France, in the department of the Charente, and chief place of a canton, in the diſtrict of Cognac, ſituated on the Charente; 6 miles E. of Cognac. The place contains 1725, and the canton 10,420 inhabitants, on a territory of 162½ kiliometres, in 14 communes.

JARNAGES, a town of France, in the department of the Creuſe, and chief place of a canton, in the diſtrict of Bouſſac; 16 miles S. of Bouſſac. The place contains 727, and the canton 6118 inhabitants, on a territory of 207½ kiliometres, in 12 communes.

JARNOWICH, or Giornovichi, in *Biography*, one of the moſt agreeable performers on the violin of the preſent age, or perhaps of any age. He delighted, if not aſtoniſhed more, the oftener he was heard. No one had more facility of execution, or executed with more grace the greateſt difficulties. He compoſed concertos, which, without appearing learned, or dividing the attention by the contrivance of the inward parts, cheriſh the melody of the principal violin, and give a relief to the moſt rapid as well as the moſt pathetic periods of the cantilena. But ſuch was the brilliancy of his bow, that he always ſeemed playing with his part. His ſlow movements never border on pſalmodia, but have always a "unity of melody" of the moſt intereſting and engaging kind, ſo complete in taſte and variety, as to ſtand in no need of graces or embelliſhments to make it palatable. In his manner of playing, in the carriage of himſelf and his inſtrument, there was a ſomething for which we have no elegant word; an ignorant and vulgar critic would perhaps call it a *ſlang*. If this performer, while in England, had been leſs capricious, and of a temper more practicable, he might have governed the muſical world as deſpotically as Giardini had done before, and been a much richer man than caprice and extravagance

gance would ever allow him to be. Though the French, with their uſual ingenuity of diſguiſing names, call him Jarnowich, he wrote Giornovichi, being by birth a Sicilian.

This admirable performer, after quitting England, reſided a conſiderable time at Hamburgh, where he was no leſs remarkable for his performances on the violin, than as a ſword's-man, a dancer, a billiard-player, and for feats of activity of all kinds. When in England, at the ſame time as the accompliſhed creole, St. George, he was a match for him with the foils, and more than a match for the fencing-maſters. And being a man of a difficult commerce, and very ſenſible of his ſuperiority in the uſe of arms, he was often captious and inſolent in ſociety, and wiſhed for nothing more than opportunities of manifeſting his talents. He had fought ſeveral duels in France and Ruſſia before his arrival in England; and after quitting our iſland, he was wounded in the arm at Hamburgh, in an affair of honour, ſo ſeverely, that it was thought both his bow-hand and ſword-arm were ſo diſabled, as never more to allow him either to fiddle or fight. And ſome years elapſed before he was again heard of as a muſician. During which tranquil period he ſeems to have ſubſiſted as a gambler, being dextrous at all kinds of games. But in 1804, going again to Ruſſia, accounts came to this country that he died at a billiard table at Peterſburg, the latter end of that year.

Though Jarnowich's taſte, fancy, and performance on the violin were ſo excellent, as a compoſer, he ſeems to have been ſelf-taught, and not a regular bred contrapuntiſt. It has been ſaid, that in his early youth he had been an apprentice to a rope-dancer and tumbler; which will account for his extraordinary agility, feats of activity, and dancing talents. He danced a hornpipe, not only better than any of our ſailors, but as well as Nancy Dawſon, or Slingſby. The reſt of his hiſtory is but little known. He arrived, at an early period of his life, at Paris, and delighted and aſtoniſhed all hearers. In 1780 he had quitted that capital to viſit other countries. M. Laborde, in his "Eſſais ſur la Muſique," tom. iii. publiſhed that year, gives him a great and juſt character for his captivating performance on the violin; but ſeems to over-rate his concertos, when he ſays they were as learned as agreeable.

JARNSKOG, in *Geography*, a town of Sweden, in Wermeland; 38 miles N.W. of Carlſtadt.

JARNUS, a town of Egypt; 13 miles N. of Abu-Girgé.

JAROCZOW, a town of the duchy of Warſaw; 20 miles W.N.W. of Kaliſh.

JAROMIRZ, a town of Bohemia, in the circle of Konigingratz; nine miles N. of Konigingratz.

JARON, or JARRON, a town of Perſia, in the province of Farſiſtan, on the road from Iſpahan to Gamron. The houſes are conſtructed of earth, and the moſques are mean. In the town and gardens are many palm-trees, highly eſteemed by the Perſians for their beauty and fruit, and furniſhing a profitable article of trade; 80 miles S. of Schiras. N. lat. 28° 35′. E. long. 52° 42′.

JAROS, a ſmall iſland of the Mediterranean, near the coaſt of France. N. lat. 43° 12′. E. long. 6° 25′.

JAROSLAVL, a city of Ruſſia, and capital of a government, deriving its name from it: it is large, well built, and commercial, ſituated on the Volga; containing eighty churches, three convents, above 6000 houſes of wood, and more than 20,000 inhabitants. It abounds with manufactures of Ruſſia leather, in which 6000 artizans are employed; firſt eſtabliſhed by Czar Peter I., and rendered very flouriſhing by Erneſt John, duke of Courland, during his exile in this place; 144 miles N.N.E. of Moſcow. N. lat. 37° 35′. E. long. 30 14′.

JAROSLAVSKOI, a government of Ruſſia, bounded on the E. by the government of Koſtrom, on the N. by thoſe of Vologda and Novgorod, on the W. by Tverſkoi, and on the S. by Vladimir; about 160 miles in length, and from 30 to 110 in breadth. The capital is Jaroſlavl.

JAROSLAW, a town of Auſtrian Poland, in Galicia; 48 miles W.N.W. of Lemberg.

JAROSOT, a town of Poland, in the palatinate of Kiev; 36 miles W. of Bialacerkiev.

JAROTSIN, a town of the duchy of Warſaw; 14 miles W.N.W. of Kaliſh.

JAROU-SANPOO, a branch of the Sanpoo, or Burhampooter river, which riſes in Thibet; 30 miles E. of Darmadijira.

JARPOUR, a town of Hindooſtan, in Baglana; 24 miles E. of Bahbelgong.

JARRA, a town of Africa, in the Mooriſh kingdom of Ludamar; the town is extenſive, the houſes are built of clay and ſtone intermixed, the clay anſwering the purpoſe of mortar; the majority of the inhabitants is compoſed of Negroes, from the borders of the ſouthern ſtates, who prefer a precarious protection under the Moors, which they purchaſe by a tribute, to continuing expoſed to their predatory hoſtilities. The tribute they pay is conſiderable; and though they manifeſt towards their Mooriſh ſuperiors the moſt unlimited ſubmiſſion and obedience, they are treated by them with the utmoſt indignity and contempt. N. lat. 15° 5′. W. long. 7° 13′.

JARRAH, a town of Hindooſtan, in Oude; 14 miles S. of Allahabad.—Alſo, a town of Hindooſtan, in the circar of Chandail; 30 miles W. of Saipour.

JARRETIER, in the *Manege*, an obſolete French word, ſignifying a horſe whoſe houghs are too cloſe together; which is now expreſſed in French by *crochu*, *i. e.* crooked or hooked.

JARRIE, LA, in *Geography*, a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of La Rochelle; ſix miles S.E. of La Rochelle. The place contains 1163, and the canton 9729 inhabitants, on a territory of 157½ kiliometres, in 14 communes.

JARS, GABRIEL, in *Biography*, was born at Lyons in 1732. His father was concerned in the mines of the Lyonnois, and as the ſon diſcovered an early attachment to the art of metallurgy, he was placed in the eſtabliſhment for the conſtruction of bridges and cauſeways, in order to obtain a practical knowledge of the buſineſs of a miner and civil engineer. He was ſoon fixed on as a fit perſon for introducing improvements into the art of working mines in France, and with this view he viſited and ſtrictly ſcrutinized moſt of the mines on the continent, and thoſe in Scotland and England. On his return he ſet about arranging the obſervations which he had been able to make, when a ſudden death in 1769 broke off his deſigns. His works were publiſhed by his brother at Lyons, entitled "Voyages Metallurgiques, ou Recherches et Obſervations ſur les Mines et Forges de Fer, la Fabrication de l'Acier, celle du Fer-blanc, et pluſieurs Mines de Charbon de Terre, &c." in three vols. 4to. They are ſaid to form a complete collection of theoretical and practical metallurgy down to the time in which the obſervations were made. Gen. Biog.

JARUS, in *Botany*, a name by which ſome authors have called the *arum*, or *wake-robin*.

JASAD, in *Geography*, a town of Perſia, in the province of Segeſtan; 50 miles S. of Zareng.

JASENITZ, a town of Pomerania, on the W. ſide of the Oder, near its mouth; 10 miles N. of Stettin.

JASIDÆANS, in the *Hiſtory of Religion.* See JEZIDES.

JASINE, in *Botany*, a name uſed by the ancients to expreſs a ſmall kind of climbing plant, much reſembling that from which they obtained the drug called *ſcammony.* They, therefore, called this ſometimes the ſmall *ſcammony*, or *ſcammonia parva.* It climbed upon trees, and had ſmall ivy-like leaves. Pliny has deſcribed ſuch a plant as this under the name of *langini;* and it ſeems very probable that this was only a corruption of the word *jaſine*, that author having taken moſt of his accounts from the Greeks, and having frequently miſtaken their names.

JASINGPOUR, in *Geography*, a town of Hindooſtan, in Oude; 30 miles S. of Fyzabad.

JASIONE, in *Botany*, ιασιωνη, the ancient Greek name of ſome wild pot-herb, according to the lexicographers, with which the genus in queſtion has but little connection.—Linn. Gen. 455. Schreb. 596. Willd. Sp. Pl. v. 1. 888. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 241. Ait. Hort. Kew. ed. 2. v. 1. 343. Juſſ. 166. Lamarck. Illuſtr. t. 724. Gærtn. t. 30.—Claſs and order, *Pentandria Monogynia.* Nat. Ord. *Campanaceæ*, Linn. *Campanulaceæ*, Juſſ.

Gen. Ch. *Cal.* Common Perianth, or rather Involucrum, of many alternate leaves, the inner ones narroweſt, containing numerous flowers on ſhort ſtalks, permanent; proper perianth ſuperior, five-cleft, permanent. *Cor.* of each flower of one petal, regular, in five rather deep, lanceolate, ſpreading ſegments. *Stam.* Filaments five, ſhort, awl-ſhaped; anthers oblong, connected at their baſe, their ſummits ſpreading. *Piſt.* Germen inferior, roundiſh; ſtyle thread-ſhaped, the length of the corolla; ſtigma ſwelling, cloven. *Peric.* Capſule roundiſh, with five angles, crowned with the proper calyx, membranous, imperfectly two-celled, opening by a round orifice at the top. Partition divided from top to bottom. *Seeds* numerous, nearly ovate, affixed to a ſtalked, globular, unconnected receptacle, in the lower part of the capſule.

Eſſ. Ch. Corolla wheel-ſhaped, in five deep linear ſegments. Stigma club-ſhaped, cloven. Anthers connected at their baſe. Capſule inferior, imperfectly two-celled, opening at the top.

Obſ. The central flowers are often abortive, their ſtigma being more tumid and undivided. Linnæus placed this genus in his *Syngeneſia Monogamia*, an order now, by general conſent, aboliſhed.

1. J. *montana.* Linn. Sp. Pl. 1317. Curt. Lond. faſc. 4. t. 58. Engl. Bot. t. 882. A native of dry hillocks and fields throughout Europe. In England it is known by the name of Sheep's Scabious. The *root* is annual. *Herb* roughiſh, pale, with ſeveral *ſtems*, and oblong, waved, narrow *leaves. Flowers* terminal, ſolitary, ſtalked, of a ſky-blue, and very pretty. The genus is nearly allied to *Phyteuma* in habit and characters.

There is ſaid to be a perennial variety, about which we have often enquired in vain.

JASK, in *Geography*, a town of Croatia; 14 miles N. of Carlſtadt.

JASKAS, a town of Sweden, in the government of Abo; 14 miles N.W. of Abo.

JASLO, a town of Poland, in the palatinate of Sandomirz; 72 miles S.S.W. of Sandomirz.

JASLOWIECZ, a town of Poland, in the palatinate of Kaminiec; 41 miles W.N.W. of Kaminiec.

JASLOWITZ, a town of Moravia, in the circle of Znaym; 10 miles S.E. Znaym.

JASMELÆUM, a medicinal oil, called alſo by the Perſians *jaſme;* it is made by putting two ounces of the white flowers of violet into a pint of oil of ſeſamum. It is uſed to anoint the body after bathing, and is in great eſteem among the Perſians for its fragrancy, though it is a ſort of ſmell which many would rather think offenſive.

JASMINE, or JESSAMINE-*Tree*, in *Botany.* See JASMINUM.

JASMINE, *Arabian.* See NYCTANTHES.

JASMINE, *Baſtard.* See CESTRUM. See alſo LYCIUM.

JASMINE, *Cape.* See GARDENIA.

JASMINE, *Fennel-leaved.* See IPOMOEA.

JASMINE, *Ilex-leaved.* See LANTANA.

JASMINE, *Perſian.* See SYRINGA.

JASMINE, *Red.* See PLUMERIA.

JASMINE, *Scarlet and yellow.* See BIGNONIA.

JASMINEÆ, a natural order of plants, ſo called from *Jaſminum*, which is one of them. This order is the 37th in Juſſieu's ſyſtem, or the fourth of his eighth claſs, and is equivalent to the 44th of Linnæus, or *Sepiariæ.* For the characters of Juſſieu's eighth claſs, ſee GENTIANÆ. The order in queſtion is thus characterized.

Calyx tubular. Corolla tubular, regular; (in *Fraxinus* either wanting, or of four petals.) Stamens moſtly two. Style one; ſtigma two-lobed. Fruit either capſular (in the manner of the order of *Acanthi)*, or pulpy; in ſome caſes with two cells and two ſeeds; in others of one cell, with one, two, or four ſeeds. Embryo ſtraight, flat, generally incloſed in a fleſhy albumen. Stem ſhrubby, more rarely arboreſcent, with oppoſite branches. Leaves for the moſt part oppoſite. Flowers either panicled in an oppoſite manner, or corymboſe.

The ſections are two.

1. With a capſular fruit. This contains *Maytenus* of Molina, with *Nyctanthes, Syringa, Hebe* (which is a *Veronica)*, and *Fraxinus.*

2. With a pulpy fruit. This ſection conſiſts of *Chionanthus, Olea, Phillyrea, Mogorium* (which is properly not diſtinct from *Jaſminum)*, *Jaſminum* and *Liguſtrum.*

The *Jaſmineæ* form an elegant and diſtinct order, valuable for the elegance of their flowers, which, moreover, are uſually very ſweet-ſcented, though in ſome inſtances unpleaſantly ſtrong.

JASMINOIDES. See LYCIUM.

JASMINUM, in *Botany*, from ιασμιν, a *fragrant ointment*, or *perfume*, alluding to the ſweet ſcent of the flowers. Linn. Gen. 9. Schreb. 12. Willd. Sp. Pl. v. 1. 35. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 15. Brown. Prodr. Nov. Holl. v. 1 520. Juſſ. 106. Tourn. t. 368. Lamarck. Illuſtr. t. 7. Gærtn. t. 42. Claſs and order, *Diandria Monogynia.* Nat. Ord. *Sepiariæ*, Linn. *Jaſmineæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, oblong, permanent; its margin five-toothed and erect. *Cor.* of one petal, ſalver-ſhaped; tube cylindrical, long; limb flat, in from five to eight deep, ſomewhat elliptical, lobes. *Stam.* Filaments two, ſhort; anthers ſmall, within the tube of the corolla. *Piſt.* Germen ſuperior, roundiſh; ſtyle thread-ſhaped, reaching as high as the anthers; ſtigma two-lobed. *Peric.* Berry double, ſmooth, each of one cell. *Seeds* ſolitary, large, ovate-oblong, convex on one ſide, flat on the other, coated with pulp.

Eſſ. Ch. Corolla ſalver-ſhaped; its ſegments from five to eight. Berry double. Seeds ſolitary, coated.

This delightful genus conſiſts of 21 ſuppoſed ſpecies in Willdenow's Sp. Pl. Linnæus confined it to ſuch as have a five-cleft corolla, he having referred thoſe which have eight ſegments in that part to *Nyctanthes*, for want of attention to the fruit. This in the *Arbor triſtis*, the only true *Nyctanthes*, is capſular, but in all his other ſpecies pulpy; for which reaſon ſir J. Banks and Dr. Solander firſt properly removed all ſuch to the genus before us, of which their manuſcripts contain deſcriptions of many more, hitherto unpubliſhed. Eleven of Willdenow's ſpecies have ſimple leaves, eight ternate, and two pinnate ones.

Among the former are J. *hirſutum* and *pubeſcens*, figured in Sm. Exot. Bot. v. 2. t. 118, and there ſhewn to be one and the ſame plant; in the ſame predicament are *anguſtifolium* and *vimineum*, of which a plate may be ſeen in Rheede Hort. Mal. v. 6. t. 53. So that the number of ſpecies in Willdenow's firſt ſection are diminiſhed to nine, and his whole number to 19. One of the moſt intereſting of this firſt ſection is the Arabian Jaſmine, *J. Sambac*, *Nyctanthes Sambac* of Linnæus, a native of the Eaſt Indies, and very general in our ſtoves, where its elegant white bloſſoms, purpliſh in decay, are abundantly produced, and diffuſe the ſweeteſt poſſible fragrance. A double variety, ſometimes ſeen, is highly valued; ſee Andr. Repoſ. t. 497. A ſtill finer variety is the *Kudda Mulla* of Hort. Malab. v. 6. t. 51, figured alſo in Tilli, Hort. Piſan. t. 30. This laſt, though eaſily propagated, was confined to the gardens of the grand duke of Tuſcany, and not given to any one. Such ſtupid illiberality met with its juſt reward after a time, in the loſs of the plant, which, if diſperſed, might have been preſerved.

In the ſecond ſection are, among others, J. *azoricum*, frequent in green-houſes, valuable for its ſhining broad leaves, and ſweet white flowers:

J. *fruticans*, Curt. Mag. t. 461, native of the ſouth of Europe, hardy with us, bearing yellow but ſcentleſs flowers: and

J. *odoratiſſimum*, Curt. Mag. t. 285, found in Madeira, very commonly kept in green-houſes, for the ſake of its very ſweet and handſome yellow bloſſoms.

J. *officinale*, Curt. Mag. t. 31, our common white jaſmine, a native of the Eaſt, but ſo generally cultivated that it can hardly be found certainly wild; and the moſt ſhowy Catalonian jaſmine, J. *grandiflorum*, are the only ones known with pinnate leaves. This laſt is much more tender than the *officinale*, with larger flowers, elegantly tinged with red underneath. It grows in India, nor is there any good reaſon for the name of Catalonian jaſmine.

Jasminum, in *Gardening*, a genus containing plants of the hardy and tender, deciduous and evergreen, ſhrubby kinds; of which the ſpecies chiefly cultivated are the common white jaſmine (J. officinale); the common yellow jaſmine (J. fruticans); the Italian yellow jaſmine (J. humile); yellow Indian jaſmine (J. odoratiſſimum); the Spaniſh or Catalonian jaſmine (J. grandiflorum); the Arabian jaſmine (J. Sambac); and the Azorian jaſmine (J. Azoricum.)

This ſort has varieties with white ſtriped leaves, and with yellow ſtriped leaves.

The ſecond ſort is extremely productive in ſuckers from the roots.

Method of Culture.—Of theſe plants the firſt ſort is readily increaſed by layers or cuttings. The young branches ſhould be laid down in the early autumn, and in the following autumn be taken off, and planted where they are to grow. The cuttings of the young ſhoots may be planted either at the ſame time or in the early ſpring, being protected in the firſt caſe, in ſevere weather, in the winter. When they are well rooted, they may be removed, with balls of earth about their roots, to the places where they are to grow up and remain.

And the different varieties are increaſed by budding or grafting them upon ſtocks of the plain or common kind. See Budding and Grafting.

In reſpect to the common ſorts, they muſt be planted againſt walls, pales, or other fences, that may ſerve as a ſupport. When planted as a ſtandard, it is difficult to train to a proper head, and keep in order, without deſtroying the flowering branches which are the extremities of the ſame year's ſhoots. On this account they ſhould be permitted to take their natural growth in the ſummer, and not be pruned or nailed till towards the latter end of March, when the froſts are over, to prevent their being injured by them.

But the varieties ſhould be planted in a ſouthern aſpect, and a warmer ſituation than the common ſort, eſpecially the firſt, which, in very ſevere winters, ſhould be protected with mats or other means.

The ſecond ſort may be increaſed by layers, or planting the ſuckers taken from the roots, in the ſpring or autumn. The layers may be made as in the firſt ſort.

The third ſort is capable of being propagated either by budding or in-arch-grafting upon ſtocks of the ſecond kind, or by layers of the young tender branches made in the autumn or early ſpring ſeaſons; but the former is the better practice, as producing more hardy plants. It ſhould have a rather warm aſpect, as a ſouth wall, and, in very ſevere winters, have the protection of mats. It requires the ſame ſort of pruning as the firſt ſort.

The four following ſorts are more tender in their nature and habits.

The firſt of them may be increaſed by ſeeds or layers of the young ſhoots. The ſeeds ſhould be ſown in the early ſpring, in pots of freſh light earth, plunging them in a moderate hot-bed, and when the plants are up, removing them into a ſecond hot-bed to forward them, giving them frequently ſlight refreſhings of water and gradually hardening them to the full air. They ſhould be occaſionally watered in the winter, and in the ſpring following be removed into ſeparate pots, the earth being carefully preſerved about their roots. Their firſt growth may be promoted by placing them in a mild hot-bed. They afterwards require a pretty free air and ſlight protection from froſt in winter. They ſhould have the decayed branches pruned out in the ſpring, without the others being ſhortened, as the flowers are produced at the extremities of the branches.

In the latter method the young ſhoots ſhould be laid down in the early ſpring, as about March, being ſlightly nicked underneath at a joint, and often ſlightly watered in dry weather. In the following ſpring they may be taken off, and planted out in pots filled with light earth, ſeparately; being afterwards managed as the others.

They may likewiſe be raiſed by inarch-grafting into ſtocks of the ſecond ſpecies, but the plants produced in this way are not ſo ſtrong as thoſe upon their own ſtocks, and they are apt to ſend out too many ſuckers from the roots.

The ſecond of theſe tender kinds may alſo be raiſed by budding or inarch-grafting upon ſtocks of the firſt ſpecies, which renders it more hardy than its own; but the plants are moſtly brought from Italy, in bunches of four together, and which, after having their roots moiſtened, and the ſhoots and dead parts pruned away, as well as the tops cut down to within a few inches of the grafted parts, may be planted in pots filled with light freſh earth, plunging them in a moderate bark hot-bed, ſhading them from the ſun, and giving them water. When they begin to grow, all the ſhoots below the grafts ſhould be rubbed off, and the top ſhoots cut off, free air being admitted, ſo as to gradually harden them to be ſet out in a warm ſituation. They muſt have the protection of the green-houſe in winter, and be frequently ſparingly watered, a free air being admitted in mild weather.

The third of theſe tender ſorts may be raiſed by layers and cuttings; but the firſt is the beſt method, as the cuttings require much care to make them ſtrike. The young branches ſhould be laid down in the ſpring, in pots filled with ſoft loamy earth, plunging them in a tan hot-bed, and watering them occaſionally. In the autumn, when they have ſtricken root, they ſhould be taken off, and planted out in ſeparate ſmall pots, plunging them in a hot-bed, due ſhade being given. The cuttings may be planted in pots of the ſame ſort of earth during the ſummer, plunging them in a tan hot-bed, and covering them cloſe with a bell or hand glaſs, due ſhade being given, and occaſional waterings. When they have taken good root, in the beginning of autumn, they may be removed into ſeparate pots, and be managed as thoſe from layers.

Theſe plants ſucceed beſt when kept in the ſtove.

The laſt of theſe tender ſorts may be increaſed in the ſame way as the fourth ſpecies, and requires the ſame management afterwards.

The three firſt ſpecies may be employed as plants of ornament for covering walls, palings, and other naked erections about houſes, as well as occaſionally introduced as ſtandards in clumps, borders, and other parts of pleaſure grounds.

The other ſorts afford variety among other potted green-houſe and ſtove plants. Some may likewiſe be trained againſt warm walls or palings, eſpecially the laſt kind which has a fine fragrance, and at the ſame time a good appearance.

JASMUND, in *Geography*, a peninſula of the iſland of Rugen, which forms, with another peninſula called "Witto," a large bay, fronting the north-eaſt, which, in hazy weather, often proves deſtructive to veſſels. The bay is called "Tromperwyck." N. lat. 54° 35′. E. long. 13° 45′.

JASOUN, a town of Aſiatic Turkey, in the government of Sivas, on the Black ſea; 75 miles N.E. of Samſoun.

JASPACHATES, in the *Natural Hiſtory of the Ancients*, a name given to ſome varieties of the agate-jaſper, mentioned under No. 5. in the following article.

JASPER, *Jaſpe*, Fr. *Jaſpis*, in moſt other European languages; a mineral ſpecies belonging to the claſs of earthy foſſils, and divided by Werner into ſix ſub-ſpecies diſtinct from each other, both by their oryctognoſtic and geognoſtic characters; *viz.* 1. Egyptian jaſper; 2. Ribbond jaſper; 3. Porcelain jaſper; 4. Common jaſper; 5. Agate jaſper, and 6. Opal jaſper. They agree in their being opaque or ſlightly tranſlucent at the edges, in hardly ever affecting vivid colours, in their always occurring maſſive and in common external ſhape (except the Egyptian jaſper); in their hardneſs being rather inferior to that of common quartz. The remaining external, in conjunction with the geognoſtic, characters have been thought ſufficient by Werner to divide the jaſpers into the above ſub-ſpecies, which by ſome other writers are conſidered as varieties only. Some jaſpers are nearly related to heliotrope, others approach the nature of indurated clay, argillaceous iron-ſtone, and lithomarge; the opal jaſper paſſes into the opal.

Almoſt all coloured jaſpers, according to Haüy, are conductors of electricity; a property obſervable by bringing them into contact with an electrified conductor, when, on the approach of the finger, they emit ſparks.

1. *Egyptian jaſper; Egyptian pebble. Quartz jaſpe panaché*, Haüy; *Caillou d'Egypte*, Fr.; *Egyptiſcher Kieſel, Nilſtein*, Germ.; *Silex Ægyptiacus, Niloticus*, Lat.

Brown and yellow are the predominant colours of this jaſper, and generally ſeveral ſhades of them occur together in the ſame piece. The brown is uſually a deep cheſnut or liver brown, ſometimes approaching to blackiſh brown, and an admixture of red is likewiſe obſervable; at Baaden a variety is ſaid to occur in which the red predominates. The yellow is moſtly a deep iſabel-yellow, alſo greyiſh yellow; it likewiſe paſſes into ſeveral ſhades of pale red. Two of theſe colours are generally mixed in ſuch a manner that the one, particularly the brown, forms the ground, while the other repreſents a ſucceſſion of variouſly contorted, concentric, irregular zones or bands, and ſpots which, in conjunction with black dendritical and other delineations, often produce repreſentations of grottos, landſcapes, human figures, and other objects.

It has hitherto been found only in rolled moſtly oblong pieces, and in the form of balls, with uneven ſurface. Theſe have alſo been found hollow, druſed with brown quartz cryſtals; but ſuch ſpecimens are very rare.

Both externally and internally it is moderately gliſtening; luſtre more or leſs reſinous. Fracture flat conchoidal. It is pretty eaſily frangible. Its hardneſs is rather leſs than that of quartz. Fragments indeterminately angular and very ſharp-edged; perfectly opaque, and only ſlightly tranſlucent at the edges. Specific gravity 2.564, Briſſon; 2.600 Brünnich.

Before the *blow-pipe* the Egyptian jaſper is infuſible without addition. When ignited for a conſiderable length of time it loſes its colour.

The proportion of the component parts of this ſubſtance muſt, of courſe, be ſubject to conſiderable variation, according as the brown or yellow maſs predominates. A variety analyzed by Delametherie, yielded

Silica	54
Alumine	30
Oxyd of iron	16

This jaſper is *found* pretty abundantly in Egypt, particularly in the neighbourhood of Cairo and Suez, on the borders of the Nile. According to Dr. Reuſs, it occurs alſo, as rolled pieces, at Koſchatek, in the Bunzlau circle of Bohemia. It is alſo ſaid to be found at Freiſe in Lotharingue.

Of its *geognoſtic* ſituation, no more is known than that it always occurs in rounded pieces, which appear not to owe their origin to rolling, but to be original, and produced by infiltration. It has been ingeniouſly remarked by Mr. Mohs, that the interior of thoſe balls is generally found to agree exactly with their exterior form, in the ſame manner as in ſome hornſtone-balls, in which the nucleus is ſeparated from the ſurrounding coatings by a conformable coating of cryſtallized quartz, &c. If this be the caſe, neither the colour, nor the delineations in the Egyptian jaſper, can be conſidered as derived from without, nor its form as a ſecondary one; and we may further infer from this, that the balls of this jaſper, (at leaſt thoſe of the brown variety from Egypt,) are formed like agate balls in rocks belonging to the formation of the amygdaloid. Werner, as we are told by Mr. Jameſon, ſuſpects that it occurs imbedded in a brown ochre of iron. Mr. Patrin is of opinion, that theſe rounded maſſes have originally been ſimple ferruginous geodes, formed in marley ferruginous ſoil, abounding with iron ochre, which has moulded itſelf into oval maſſes compoſed

poſed of concentric layers. Theſe layers, in the progreſs of time, will ſhrink both by deſiccation and the effects of the mutual attraction of the ferruginous molecules, which have a perpetual tendency to enter into the cloſeſt poſſible combination. The layers of the geode, by their condenſation, become more or leſs ſeparated from one another, and its centre remains empty, in caſe the whole maſs is compoſed of nothing but pure oxyd of iron; but when mixed with marle, this latter is continually preſſed towards the centre, where it forms a nucleus more or leſs light coloured, in proportion as it has parted with the iron it contained, and which has united with that of the neighbouring layers. In the ordinary way of occurring, (Mr. Patrin obſerves,) it appears that theſe geodes remain nearly in the ſame ſtate in which they were formed; but in Egypt ſome particular circumſtance has made them undergo a new modification. Decompoſition, or other circumſtances that may have altered the nature of the ſoil that contained theſe geodes, muſt have cauſed the developement of various fluids, which penetrating through the pores of the geode, and combining with the fluids it contained, have formed there the ſiliceous matter in the ſame manner in which water is formed by the combination of hydrogen and oxygen.

Cordier obſerved this jaſper to enter into the compoſition of an Egyptian breccia, made up of a great variety of rounded ſtones; and it is ſuppoſed that thoſe places where this breccia forms extenſive beds, the greater part of the rolled pieces that are ſeen there, owe their preſent detached ſtate to a diſintegration of ſuch maſſes.

The Egyptian jaſper is much eſteemed on account of its delineations, which are often very ſingular; and as it is ſuſceptible of a very high poliſh it is cut by lapidaries into thin pieces for ſnuff-boxes, broaches, &c.

2. *Ribbond jaſper, Striped jaſper,* Kirw. James.; *Band jaſpis, Band ſtein,* Germ.; *Quartz jaſpe onyx,* Haüy. *Jaſpe rubané, J. en ruban,* Broch, &c. *Jaſpis vittata,* Forſt.

It always exhibits two, three, or more colours together, which are diſpoſed in alternating, ſtraight, ſeldom waved, ſtripes or layers. The colours are yellowiſh, greeniſh, and pearl-grey, yellowiſh, and greeniſh-white, ochrey, and iſabell-yellow, mountain and leek-green, fleſh, cherry, and browniſh-red.

It is always found maſſive, internally it is dull; the luſtre it occaſionally exhibits proceeding from admixed heterogeneous particles.

Its hardneſs is leſs than that of quartz. It is brittle and eaſily frangible; fracture conchoidal, but ſometimes approaching to ſplintery or earthy; alſo a tendency to the ſlaty fracture has been obſerved in ſome varieties. Fragments indeterminately angular, ſharp-edged. Specific gravity from 2.500 to 2.800.

The ribbond jaſper is found in Siberia, particularly in the diſtricts of Koliwan and Catherinebourg; in Sicily; Corſica; Switzerland; in Germany, at Gnandſtein and Wolflitz near Frohburg, in the Leipzig diſtrict; at Ilmenau in Henneberg, at Falkenſtein; on the Hartz, and in the Palatinate. It probably occurs alſo, according to Jameſon, in the Pentland hills near Edinburgh.

The *geognoſtic* relations of this jaſper appear to be ſufficiently diſtinct from that of the others, it forms conſiderable maſſes and beds, with whoſe connection, however, we are as yet unacquainted. The ribbond jaſper of the Hartz, as connected with grauwacke on which it reſts, cannot be doubted to be ſubordinate to the tranſition rocks. Mr. Patrin conſiders this jaſper and all others that occur in beds, and are entirely opaque, to be primitive; and moſt of the Siberian jaſpers are in that predicament. He refers to the *ſecondary* jaſpers, all thoſe that have a vitreous fracture combined with a ſlight degree of tranſlucidity. But ſeveral circumſtances connected with the geognoſtic occurrence of the different jaſpers, prevent us from admitting this diſtinction.

The fineſt Siberian ribbond jaſper is found, together with other varieties, in the hills that border on the ſouthern part of the Ural mountains, about 100 or 150 leagues northward of the Caſpian ſea, in the neighbourhood of the fortreſs of Orſkaia. The red and green layers of this jaſper being ſo well defined and regular, it is made uſe of for ſeveral purpoſes of ornament, particularly for cameos. It is not found in large maſſes. Patrin informs us, that when ſeen in its native place, it appears to admit of being quarried in blocks of ſeveral feet in ſize; but as ſoon as the rock is wrought, it ſeparates into ſmall pieces.

3. *Porcelain-jaſper. Porcellanite,* Kirw. *Jaſpe porcellaine,* Broch. *Jaſpe porcellanite,* Brongn. *Thermantide porcellanite,* Haüy. *Diaſpro porcellanico,* Nap. *Porzellan-jaſpis, Porzellan-ſtein,* Germ.

Its principal colour is a bluiſh-grey, of various intenſity, generally intermediate between pearl-grey and lavender-blue. It is alſo found yellow, ſuch as ochre and ſtraw, and even pale orange-yellow, which paſſes into brick-red. Clove-brown and liver-brown are likewiſe mentioned among its colours; as alſo bluiſh-black and mountain-green. Sometimes ſeveral of theſe colours occur together in ſpots, and in flamed and clouded delineations. The bluiſh-grey varieties, however, exhibit generally but one colour, beſides the red and yellowiſh-brown colour on the rifts, and the red or brown coloured impreſſions of various vegetables.

It occurs commonly maſſive, and ſometimes in blunt-edged and rounded rolled pieces, which, in the rents they exhibit, bear evidently the marks of the action of fire.

Internally its luſtre is inconſiderable; it ſeldom approaches to ſhining.

Its hardneſs is inferior to that of moſt other jaſpers; it is very brittle: fracture imperfectly conchoidal, approaching to even: fragments indeterminably angular, pretty ſharp-edged; perfectly opaque; ſpecific gravity 2.330, Kirwan; 2.603, Wiedenmann.

By the continued application of intenſe heat, the porcelain-jaſper, according to Wiedenmann, may be fuſed into a black ſcoria. But the yellow variety, operated upon by Klaproth, ſhewed no change either in the clay or charcoal crucible, except that in the former it was ſeen to contract, and its ſurface to become dark ſteel-grey and dull, while in the charcoal crucible a ſmall piece became black and gliſtening, and acquired a yellowiſh-brown ſurface.

The conſtituent parts of the pearl-grey variety, from Stracke, in Bohemia, are ſtated as follows by the late Mr. Roſe, by whoſe death the world has loſt one of the moſt accurate analyſts.

Samml. Pract. Chem. Ath.

This ſubſtance is found in Bohemia (at Schwintſhitz, Stracke, near Carlſbad, &c.), in Saxony (at Planitz), in the Upper Palatinate, in Heſſia (near Almerode), in Saarbruck (at Dutweiler), in Siberia (at Kuſnezk, in the diſtrict of Koliwan), Iceland, &c. It occurs in conſiderable maſſes, and obviouſly owes its origin to the action of ſubterraneous fire: Werner therefore ranks it with his pſeudo-volcanic, or ſuch foſſils whoſe nature has been conſiderably altered by the proximity of that agent. That it has not been in a ſtate of fuſion is proved by the impreſſions of plants ſo frequently obſerved in it, and which beſpeaks the foſſil to have originally been that variety of ſlate-clay which belongs to the coal formation. We accordingly find it in company with burnt clay, earth-ſlag, &c. in countries which have either formerly experienced the ravages of ſubterraneous fires, or where beds of coal are actually in a ſtate of ignition. It is a fact worthy to be noticed, that at Dutweiler, in the county of Saarbruck, which not long ago experienced the ſpontaneous inflammation of a bed of coal, both porcelain-jaſper, and other pſeudo-volcanic ſubſtances, are ſeen as it were in a progreſſive ſtate: they are more or leſs changed in proportion to their diſtance from the principal ſeat of the ſubterraneous fire; and the vegetable impreſſions which they exhibit are in every reſpect the ſame with thoſe obſerved on the ſlate-clay.

The porcelain-jaſper has obtained its name from its appearance, and the circumſtances connected with its origin. It takes a moderate poliſh, but is not applied for ornamental purpoſes. Indeed, there are ſeldom any large pieces of it found without rifts and fiſſures.

4. *Common jaſper. Gemeiner jaſpis*, Germ. *Diaſpro commune*, Nap. *Quartz jaſpe*, Haüy. *Jaſpe commun*, Broch. *Silex jaſpis vulgaris*, Lat.

Its principal colours are brown, red, and yellow; the brown is yellowiſh, reddiſh, clove, liver, blackiſh-brown, approaching to black; the red is tile, and blood-red of various ſhades, ſeldom fleſh-red; the yellow is moſtly ochre-yellow, which paſſes into greeniſh-yellow; alſo various ſhades of green are obſerved among the colours of the common jaſper, ſuch as mountain, verdigris, and olive-green, but they are leſs frequently met with. Several of theſe colours are ſometimes ſeen together in ſmall irregularly ſtriped, ſpotted, and clouded delineations.

It occurs commonly maſſive, but alſo alternating in thin layers with quartz, &c. and diſſeminated, as in the blood-ſtone; it is likewiſe found in blunt-edged rolled pieces.

Internally its luſtre is intermediate between gliſtening and ſhining; it is rather vitreous.

It is nearly of the ſame hardneſs as the preceding ſubſpecies; it is brittle and eaſily frangible: fracture more or leſs perfectly conchoidal, approaching in ſome varieties to ſplintery, from which it paſſes into fine earthy. Fragments indeterminately angular, pretty ſharp-edged: they are generally opaque, but now and then tranſlucent at the edges. Specific gravity, 2.580 to 2.700, Kirwan; 2.652 to 2.663, Sauſſure; 2.666, Muſchenbroek; 2.692, Blumenbach.

Common jaſper is infuſible without addition before the blow-pipe; it only loſes its colour by the application of intenſe heat; with borax it is diſſolved without ebullition, while ſoda and phoſphoric acid combine with it in an imperfect manner only; when urged by oxygen gas it is converted before the blow-pipe into a white or dark grey globule.

According to Kirwan the common jaſper conſiſts of

Silica	75.00
Argil	20.00
Oxyd of iron	5.00
	100

Mr. Lampadius thinks that he has found that the reddiſh-brown variety is generally coloured by the oxyd of uranium and ſome iron, the proportion of the uranium being about three per cent.

Among the *localities* of the common jaſper are: Saxony (Altenberg, Geiſing, Freiberg, Seiferſdorf, Schneeberg, Eibenſtock, &c.); Bohemia (Jeſhkner mountains, &c.); Sileſia (Bunzlau, Landſhut, &c.); Salzburg; Steurmark; Hungary and Tranſylvania; Italy, particularly Sicily; France; Scotland (according to Jameſon, in the tranſition rocks near Edinburgh), the Shetland iſlands, Norway, &c.

The common jaſper is excluſively a production of veins: it occurs in ſuch as are chiefly compoſed of iron ore, to which indeed it appears to bear great geognoſtic affinity. The ſubſtances with which it occurs together in theſe veins are red and brown iron-ſtone, iron-flint, quartz, opal, lithomarge, &c.; as alſo, ſometimes, galena, pyrites, and vitreous ſilver. But common jaſper is alſo found conſtituting veins for itſelf without any metallic ores, and only accompanied by ſome amethyſt or common quartz, which in this caſe generally occupy the middle of the vein. It likewiſe occurs as a conſtituent part of agate balls in amygdaloid. At Salzburg it is ſaid to have been found in calcareous and clay ſlate rocks, and at Offenbanya, to form the baſis of a particular kind of porphyry; but this latter obſervation ſeems to be founded on error, ſince all the Tranſylvanian varieties of porphyry that have fallen under the obſervation of Werner, and other mineralogiſts well acquainted with the true characters of jaſper, have pronounced them to belong to the clay, horn-ſtone, and pitch-ſtone porphyries.

Moſt varieties of the common jaſper are ſuſceptible of a tolerably good poliſh, whence they are frequently cut by the lapidaries, and formed into ſnuff-boxes, buttons, ſeal-ſtones, (ſee Gems, *engraved*) &c.; ſome varieties that may be procured in voluminous blocks are wrought into tables, mantle-pieces, ſmall pillars, and other objects of ornamental architecture. The following are moſt frequently ſeen in the hands of the lapidary:

The *red jaſper*, on which we poſſeſs ſome very fine antique engravings. It is found at Giuliano, at San-Stefano, at Cornerata, and at Monte-Vago, in Sicily; and occurs alſo in the vicinity of Geneva, in the valley of Chamouni; at Grenoble, in the department of the Iſere; and at Mont-More, in the department of the High Alps. Canavais, in Piedmont, is ſaid likewiſe to furniſh good red jaſper. This ſhould not be confounded with iron-flint and ſinople, which is a variety of quartz.

The *yellow jaſper*: it is ſeldom found in large pieces, and only uſed for inlaid work, moſaic, &c. The beſt is found at Giuliano, in Sicily; and it occurs alſo in the valley of Chamouni, and between Varet and Grenoble, in the department of the Isère. This variety is ſeldom found equally tinged, but often traverſed by white and red veins.

Brown jaſper of various ſhades. This is the moſt common, and moſt frequently ſeen converted into objects of ornament, vaſes, pedeſtals, &c. It takes a very fine poliſh.

What the Italians call *Paragone* is, properly ſpeaking, the Lydian ſtone; but the name is now and then applied to a *black* variety of jaſper, much eſteemed by lapidaries for ſeal ſtones, &c. It is ſaid to be found at Giuliano in Sicily. (Alſo a black marble is ſometimes improperly called *Paragone.*)

The exiſtence of a *ſnow white* variety of common jaſper is doubted by ſome. What goes by this name is a white ſtone marked here and there with fine red lines; but as it has been ſeen cut and poliſhed only, its nature is not determined with accuracy. Another white jaſper is mentioned by Herrmann as occurring in more elevated parts of the Altaic mountains, near the ſource of the Korgoo; it is marked with black dendritæ. Specimens before us have the appearance of horn-ſtone.

The galactites of Pliny is, by ſome writers, conſidered as a white jaſper.

5. *Agate Jaſper; Jaſp.agate; Agat Jaſpis,* Germ.

Its colour is fleſh-red, reddiſh-white, and browniſh; alſo yellowiſh-white, which paſſes into iſabell, ſtraw, and greeniſh yellow. Theſe colours form concentric rings, and figures reſembling plans of fortifications, &c.

It occurs maſſive. Has ſcarcely any luſtre. Is rather leſs hard than common jaſper. Its fracture is ſmall and flat conchoidal, approaching to even. The other external characters are thoſe of the preceding ſpecies.

The agate-jaſper is only found in agate veins, and in agate balls occurring in amygdaloid and porphyry rocks.

It is cut and poliſhed.

6. *Opal Jaſper, Quartz reſinite commun,* Haüy.

Its principal colours are ſhades of red; fleſh-red, ſcarlet-red, brick-red, blood-red, cherry-red, browniſh-red; it alſo occurs reddiſh and yellowiſh-brown, and ſeldom ochre-yellow; theſe colours exiſt variouſly mixed, as ſpots and veins in the ſame piece; ſometimes they are uniform.

It occurs maſſive.

Internally its luſtre is more or leſs ſhining, and intermediate between vitreous and reſinous.

It is nearly of the ſame hardneſs as the preceding ſubſpecies, brittle, and eaſily frangible. Fracture large or ſmall flat-conchoidal. Fragments indeterminately angular, ſharp-edged, ſcarcely tranſlucent at the edges.

The preceding characters agree partly with thoſe of the opal; and indeed the geognoſtic relation of the opal-jaſper is perfectly the ſame as that of the opal. It is moſtly found nidulating in porphyry, ſometimes in veins, and in both caſes it is conſtantly accompanied by common opal.

Its principal locality is Kaſchau, Tockay, in Hungary, and it is alſo found near Conſtantinople, and in the mountains of Kolywan, in Sibiria.

JASPONYX. See Jasper, No. 2.

JASQUE, in *Geography*, a town of Perſia, in the province of Mecran, which gives name to a cape in the gulf of Ormuz. N. lat. 25° 40′. E. long. 59° 4′.

JASSARI, a town of Sweden, in the Lapmark of Kimi, in the gulf of Bothnia; 50 miles N.N.E. of Kimi.—Alſo, a river of Sweden, which runs into the gulf of Bothnia, at the above-named town.

JASSELMARE, a country of Hindooſtan, bordering on the lower part of the courſe of the river Puddar, and on the ſandy deſert, which, as well as Nagore and Bickaneer, form a number of petty rajahſhips, and are underſtood to be moſtly inhabited by Rajpoots.

JASSENES Marmor. See Marmor.

JASSI, in *Geography*, a town of Turkiſtan, on the Sirr; 140 miles W. of Taraz.

JASSINGPOUR, a town of Hindooſtan, in Oude; nine miles E. of Sultanpour.

JASSUM-KALASI, a town of Aſiatic Turkey, on the W. coaſt of Natolia; 40 miles W. of Moglah.

JASSY, a city and capital of Moldavia, ſuppoſed to have been garriſoned in the time of the Romans; having a citadel and ſome fortifications. It is the ſee of an archbiſhop, and the inhabitants are chiefly Greeks; 200 miles E of Otchakov. N. lat. 47° 10′. E. long. 27° 44′.

JASTIAN, in the *Greek Muſic*, a name given by Ariſtoxenus to a mode more generally called by other authors *Ionian*. See Mode *and Muſic of the Ancients.*

JAT, in *Geography*, a town of Sweden, in the province of Smaland; 20 miles S. of Wexio.

JATOE, a town on the iſland of Borneo; 120 miles N. of Nagara.

JATRALIPTES, in *Ancient Medicine*, and the *Gymnaſium*, derived from ἰατρος, *phyſician*, and ἀλειφω, *I anoint*, an appellation given to the perſons who ſuperintend the uſe of oils and unguents in the gymnaſium, as well as to thoſe who directed unctuous applications to the ſick. Pliny inveighs againſt the luxurious extent to which the uſe of theſe perfumed ointments had been carried in his time, when the application of them employed as many people as the management of the baths. Under the jatraliptes were the *unctores*, who applied the ointment; the *fricatores*, who rubbed or curried the ſkin with the ſtrigil, or other inſtruments of a ſimilar kind; the *dropaciſtæ*, or *aliparii*, whoſe buſineſs it was to remove the hair, either by extraction or depilatory applications; and, laſtly, the *tractatores*, who were employed in gently moving and ſqueezing, or kneading all the limbs, to render them ſupple, and at the ſame time to give a pleaſing ſenſation. The jatraliptes was alſo called *aliptes*; both which terms were ſometimes alſo uſed to denote the maſters of the exerciſe, ſuch as the *gymnaſtes* and *pædotribæ*. The external application of oil, for the cure of diſeaſes, became a diſtinct branch of the medical art, and was called

JATRALIPTIC Medicine. This was firſt introduced, according to Pliny, by Prodicus, a native of Selymbria, and a diſciple of Hippocrates. The volumes, which treat expreſsly of its precepts, are loſt; but we find the anointing of the body with oil recommended, amoug other remedies, in various diſeaſes; as fevers, puſtular eruptions, gout, palſy, lethargy, tetanus, hydrophobia, cholera, melancholy, dropſy, profuſe ſweating, and itch. In ſurgery, it was ſuppoſed to allay irritation in thoſe who had undergone ſevere operations, to reſolve indurations, and to remove the pain and ſwelling attending luxations. See Le Clerc, Hiſt. de la Med. part 3. lib. i.—Pliny Nat. Hiſt. lib. xiii. cap. 1. and 3. Lib. xv. cap. 4. &c. Celſus, *paſſim*. Proſp. Alpin. de Med. Ægyptorum, lib. iii. cap. 15.—Alſo, Mr. Hunter's learned Eſſay on the External Uſe of Oil in the Edin. Med. and Surg. Journal, vol. ii. p. 185, for April, 1806.

JATROPHA, in *Botany*, apparently from ιατρος, a *phyſician*; the phyſic-nut. This is a virulent tribe of plants, whoſe oily ſeeds, at leaſt their cotyledons, are either eatable and wholeſome, or ſimply purgative, like thoſe of its near ally the *Ricinus* or *Palma-Chriſti*.—Linn. Gen. 503. Schreb. 655. Willd. Sp. Pl. v. 4. 557. Mart. Mill. Dict. v. 2. Juſſ. 389. Lamarck. Illuſtr. t. 791. Gærtn. t. 108. (Manihot; Tourn. t. 438.)—Claſs and order, *Monoecia Monadelphia*. Nat. Ord. *Tricoccæ*, Linn. *Euphorbiæ*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth ſcarcely manifeſt. *Cor.* of one petal, funnel-ſhaped; tube very ſhort; limb in five deep, roundiſh, ſpreading, convex ſegments, concave underneath. *Stam.* Filaments ten, awl-ſhaped, approaching each other in the middle, the five alternate ones ſhorter, all erect, ſhorter than the corolla; anthers roundiſh, verſatile. *Piſt.* a ſlight rudiment in the bottom of the flower.

Female, *Cal.* none. *Cor.* roſaceous, of five petals. *Piſt.* Germen ſuperior, roundiſh, with three furrows; ſtyles three, cloven; ſtigmas ſimple. *Peric.* Capſule roundiſh, three-lobed, three-celled; each cell with two valves. *Seeds* ſolitary, roundiſh, large.

Eſſ. Ch. Male, Calyx inconſtant. Corolla of one petal, funnel-ſhaped. Stamens ten, alternately ſhorter and longer.

Female, Calyx none. Corolla of five petals, ſpreading. Styles three, cloven. Capſule of three cells. Seeds ſolitary.

Obſ. J. *urens* is ſaid to have but nine ſtamens. Willdenow reckons 17 ſpecies of this genus, of which about eight were known to Linnæus, though not very perfectly. For examples of *Jatropha* may ſerve

J. *pandurifolia.* Andr. Repoſ. t. 267. Curt. Mag. t. 604. (J. acuminata; Venten. Jard. de la Malmaiſ. t. 52)—A native of Cuba, remarkable for its fiddle-ſhaped leaves, and beautiful deep ſcarlet flowers.

J. *Curcas.* Jacq. Hort. Vind. v. 3. t. 63; a native of South America, ſometimes kept in the ſtoves of botanic gardens.

J. *Manihot*, whoſe root makes the Caſſava bread in the Weſt Indies, being, though a virulent poiſon, rendered ſweet and harmleſs by waſhing its grated ſubſtance.

All theſe are ſhrubs. The *leaves* of the whole genus are ſtalked, alternate, generally lobed, and often palmate. *Flowers* corymboſe.

JATS, Jates, or *Jetes*, a tribe of Hindoos, who long ſince the death of Aurungzebe erected a ſtate in the provinces of Agra and Delhi. They appeared at firſt no otherwiſe than as banditti, but at laſt formed a regular ſtate, and fixed their capital at the city of Agra, and appear to have poſſeſſed a tract of country, along both ſides of the Jumnah river, from the neighbourhood of Gwalior to that of Delhi; in length about 160 miles and 50 broad. Col. Dow, in 1770, eſtimated their revenue (perhaps extravagantly) at 200 lacks of rupees, and their force at 60 or 70,000 men. This nation is traced by P. Wendell from the countries lying between the S.E. confines of Moultan and Gohud. Tamerlane, it is certain, made war on a people, called the "Getes," in his march from Batnir to Samanah. Nudjuff Cawn, at a late period, diſpoſſeſſed the Jats of their whole country, except the confined territory of Bhartpour. Madajee Sindia has, in turn, ſtripped Nudjuff Cawn's ſucceſſors of theſe conqueſts, which are now ſcarcely worth poſſeſſing, although a few years ago, under Soorage Mull, they ranked among the moſt flouriſhing provinces of Hindooſtan. The Jats no longer exiſt as a nation: all that remains to Runjet Sing, the ſon of Soorage Mull, being the fort of Bhartpour, or Burratpour, ſituated about 45 miles on the weſt of Agra, with a ſmall territory of four or five lacks of rupees. The rajah of Gohud is of the Jat tribe, but unconnected with Rumjet Sing. Rennell's Memoir.

JATTENDALS, a town of Sweden, in Helſingland; 16 miles N. of Hudwickſwall.

JATTIR, in *Scripture Geography*, a city of Dan (Joſh. xv. 48.), afterwards given to the Levites of Kohath's family. (Joſh. xxi. 14.) Euſebius ſays, that it is ſituated in the diſtrict of Daroma, towards Malatha, about 20 miles from Eleutheropolis.

JATTRA, in *Geography*, a town of Bengal; 15 miles N. of Midnapour.

JATTS, a ſmall iſland in the Atlantic, near the coaſt of Guinea. N. lat. 11° 48′. W. long. 15° 50′.

JAU de st. Elias, a town of Brazil, on the river Negro; 70 miles W. of Fort Rio Negro.

JAVA, one of the largeſt iſlands conſtituting the Archipelago in the Eaſt Indian ſea, about 650 Britiſh miles in length, and in medial breadth about 100 miles, ſituated between 5° 45′ and 8° 48′ S. lat., and 105° and 114° 40′ E. long. This iſland lies nearly in the direction of E. and W. and to the S. and W. its ſhores are waſhed by the ſouthern Indian ocean. On the N.W. lies the iſland of Sumatra, from which it is ſeparated by the ſtraits of Sunda; to the N. Borneo, from which it is ſeparated by the Java ſea; to the N.E. at a conſiderable diſtance, Celebes; to the E. Bali, divided from it by a narrow paſſage, called the ſtraits of Bali. This iſland is the ſouthernmoſt of thoſe four large iſlands, the other three being Sumatra, Borneo, and Celebes, which were formerly known by the appellation of the Sunda iſlands; and when the Dutch company firſt eſtabliſhed themſelves here, Java was divided into three large empires, *viz.* Bantam, Jaccatra, and the empire of the Soeſoehoenam, which laſt was the moſt extenſive, and comprehended full two-thirds of the whole iſland, Cheribon being feudatory to it. But it is at preſent divided into five ſtates or empires, *viz.* Bantam, Jaccatra, Cheribon, the empire of the Soeſoehoenam, and that of the Sultan; which altogether contain 123 provinces, or governments, the kingdom of Bantam being conſidered only as one. The four firſt of theſe are ſo dependent on the Dutch, as to be under engagements to deliver their produce to the Dutch, and not to ſell any of it to any other nation. Each province, or government, conſiſts of a certain number of "tjatjars," or families, the number of which, throughout the whole of Java, including Bantam, amounted, in the year 1777, to 152,014. Theſe families are eſtimated to conſiſt of 912,084 perſons; and if to theſe we add the inhabitants of the principality of Madura, which, though a ſeparate iſland, is always conſidered as connected with Java, and contains 10,000 families, or 60,000 perſons, the whole population of Java and Madura will amount to 972,084 perſons. Huyſen, however, gives the population of Java, excluſive of Madura, as follows: *viz.* in the kingdom of Bantam, 5000 families, in Jaccatra 33,914, in Cheribon 15,000, in the Mataram, or empire of Java Proper, 94,200, making in all 148,114 families, which, allowing ſix individuals to each family, will give 888,684 for the whole number of inhabitants; but from more recent accounts he infers, that the population of Java is 1½ or 2 millions of people. Theſe ſtatements do not include the inhabitants of *Batavia*; which ſee. A chain of high mountains, commencing to the E., in the province of Balambouang, and running through it to the W., but decreaſing in height, divides Java, longitudinally, into two parts, of which the northern portion is the largeſt and the beſt. The north coaſt has every where a low and woody foreland, with ſome hills, particularly W. of Bantam, where the high land ſtretches down to the ſea-coaſt. This iſland has ſeveral deep bays on the north ſide, as thoſe of Bantam, Batavia, Cheribon, Samarang, Joana and Sourabay, which afford every where good anchorage. The ſouth coaſts are much leſs known than thoſe on the north. In the good monſoons, the ſky is almoſt always clear, except near the time of the breaking up of the monſoons, when many and violent thunder ſtorms rapidly ſucceed each other. In the bad monſoons, the weſt winds, which then prevail, bring with them heavy rains and violent thunder-ſtorms, without much alteration in the temperature; the thermometer, in the warmeſt part of the day, generally ſtanding at between 82° and 88°. The effect of this degree of heat is much moderated by the alternate land and ſea breezes, which blow every day in regular rotation. The barometer ſeldom varies more than two or three lines. Thunberg mentions ſeveral volcanoes in this iſland, one of which had overwhelmed with aſhes a great number of coffee plantations. Java is watered by a great number of rivers, which deſcend from the chain of mountains above-mentioned, but none of them are navigable for large veſſels. The ſoil is every where a reddiſh granulated clay, which in the dry ſeaſon is ſo hard, as to be incapable of cultivation without much moiſtening, but with little labour it is extremely fertile. Ploughing is performed with buffaloes, which abound in this iſland. In general agriculture no manure is uſed; but the gardens are moiſtened with water in which oil-cakes have been ſoaked, and which renders the ſoil rich and fat. The only method which the farmer takes with his land conſiſts in burning upon it all the weeds and rubbiſh which it produces; and when one piece of ground ceaſes to yield ſufficient crops, recourſe is had to another; and the firſt is ſuffered to lie fallow for ſeveral years, after which it again recovers its fertility. The articles produced in this iſland are much more valuable than thoſe of all the neighbouring countries; of theſe the firſt article is rice, which not only ſupplies the inhabitants but provides for the eaſtern provinces and the iſland of Ceylon: this rice is of two kinds, one ſort being ſet nearly under water and another ſort planted in the rainy ſeaſon, on high ground and upon the mountains; the former, however, is the beſt, and bears the higheſt price. The pepper of Java is alſo a profitable article to the Dutch company, and ſo is the ſugar, the beſt of which is from the province of *Jaccatra*, which ſee. Coffee is likewiſe a product very advantageous to the company, the greateſt quantity being furniſhed by the provinces of Jaccatra and Cheribon. Cotton is alſo a production of Java of great value. Java alſo yields to its poſſeſſors the article of ſalt. The N. E. coaſt of the iſland, and part of the diſtrict of Cheribon, afford a very large quantity of timber, logs, beams, boards, &c. which not only ſupplies Batavia for various purpoſes, but admits of an annual exportation of a conſiderable quantity to ſeveral of the out-factories, and in particular to the Cape of Good Hope. Indigo, though it be not an original production of Java, has been cultivated with tolerable ſucceſs ſince the Dutch company have been eſtabliſhed here. Turmeric, long pepper, and cubebs, are alſo productions of this iſland. This iſland abounds with fruit-bearing trees, ſuch as the cocoa-nut palm, the Suri tree, which yields the palm-wine or toddy, china-oranges of a larger and ſmaller ſize, the tamarind-tree, the ſhaddock, the durioon or derioon-tree, the fruit of which reſembles the bread-fruit, and which is conſidered as diuretic, ſudorific, and ſerviceable in expelling wind, the Surſak-tree, the mango-tree, the mangoſtan, lemon and lime-trees, pine-apples, and many others.

The native inhabitants, called Javaneſe, whether they belong to the kingdom of Bantam, or to any other part of Java, are of a middling ſize, generally well proportioned, of a light brown or yellow complexion, with a broad forehead, and flattiſh noſe, curving downwards at the tip. The hair is black, and always kept ſmooth and ſhining by the uſe of cocoa-nut oil. They are in general proud and indolent, as well as cowardly. Their principal weapon is a kind of dagger, called a "kris," which is often poiſoned, and cauſes immediate death. Arrogant towards their inferiors, they are no leſs cringing with reſpect to their ſuperiors, from whom they expect any favour. Their dreſs conſiſts in a piece of cotton, wrapped round the waiſt, and drawn between the legs, ſo as to be faſtened behind. They are otherwiſe naked, except that they wear a ſmall cap on the head. Thoſe of ſuperior rank wear a wide Mooriſh coat of flowered cotton, or other ſtuff, and in general turbands. They ſuffer no hair but that of the head to grow. The dreſs of the women is little better than that of the men, except that it is more cloſe and covers more of the body; the hair of the head, worn long, is turned up, and twiſted round the head like a fillet, faſtened with long bodkins of various materials, and adorned with flowers. Men and women are fond of bathing. Children of both ſexes are entirely naked till about eight or nine years of age. Twelve or thirteen is their age of puberty. The Javaneſe are polygamiſts, and beſides their wives, who are as many as they can maintain, they take their female ſlaves for concubines. The women are more comely than the men; they are extremely jealous; and puniſh thoſe whom they ſuſpect of inconſtancy and infidelity by the adminiſtration of emaſculating drugs. Their habitations, rather huts than houſes, are conſtructed of ſplit bamboo, interlaced or matted, plaiſtered with clay, and covered with the leaves of the cocoa tree. The entrance is low, and they have neither door nor ſhutter. The whole houſe conſiſts uſually of one apartment, in which huſband, wife, and children, and alſo their poultry, of which they keep a great number, lie together on the ground. Their chief food is boiled rice, with a little fiſh, and their drink is water. They take a little arrack when they can obtain it, and are almoſt always chewing betel or pinang; and likewiſe a ſort of tobacco, produced here, and therefore denominated Java tobacco. This they ſmoke through pipes made of reed. They ſometimes put opium into their pipes with the tobacco, in order to invigorate their ſpirits; but the continual uſe of it rather deadens them. They have neither tables nor chairs; but ſit upon the ground, on mats, with their legs croſſed under them. They make no uſe of knives, forks, or ſpoons, but eat with their fingers. They have a certain kind of muſical inſtrument, called "gomgome," conſiſting in hollow iron bowls, of various ſizes and tones, upon which a perſon ſtrikes with an iron, or wooden ſtick, and which emit ſounds like a ſet of bells. They are very fond of cock-fighting, for which they keep a peculiar breed. The tax upon their game-cocks forms part of the revenue of the province of Jaccatra. One of their favourite diverſions, at which they are very dextrous, is a kind of tennis-play; in which they ſtrike the ball, which is of the ſize of a man's head, hollow, and made of matted reeds, with their feet, knees, or elbows. Their manner of ſalutation conſiſts in touching the forehead with the right hand, accompanied by a ſlight inclination of the body. The Mahometan religion, introduced into Java by the Arabians, is predominant over the whole iſland; though it is ſaid, that far inland, over the mountains, towards the S. ſide of the iſland, there are ſtill ſome of the aboriginal idolatrous natives. Moſques are erected all over the iſland, and there is a famous one near Cheribon. They are very particular and nice about the tombs of their ſaints, and will ſuffer nothing unbecoming to be done upon or near them. They do not bury their dead in coffins, but ſimply wrap them in a piece of white linen, and having depoſited them in the grave, place two ſtones upon it, one at the head, and one at the feet. Theſe ſtones, they believe, are to ſerve as ſeats for the two angels, who, after their death, examine into their conduct, while in this world. They have both male and female phyſicians, who are ſaid to perform wonderful cures by means of their knowledge of the medicinal and vulnerary herbs. Much friction of the affected parts is one of their chief means of cure. This is done with two fingers of the right hand, which are preſſed down by the left, and paſſed continually downwards, after having firſt anointed the part with water mixed with fine ground wood, or with oil. The coin of Java is of lead, like that of Sumatra and Borneo. The language of Java is the Malay, or a dialect ſomewhat akin to it. The original inhabitants of the country are not ſuffered to be made ſlaves, but are a free people, governed by their own emperors, kings, and governors. The capital of Java is *Batavia;* which ſee.

JAVA *Head*, the weſtern point of the iſland of Java. S. lat. 6° 47′. E. long. 107° 40′.

JAVA, *Little.* See BALI.

JAVA *Sea*, that part of the Eaſt Indian ſea, which lies between the iſland of Java to the ſouth, Sumatra to the weſt, the iſlands of Banca, Billiton, and Borneo to the north, and the iſland of Celebes to the eaſt.

JAVAT, or TSCHAVAT, a town of Perſia, in the province of Schirvan, at the union of the Aras and the Kur; 45 miles S. of Scamachie. N. lat. 39° 55′. E. long. 48° 10′.

JAVELIN, a kind of ſpear, or half-pike, uſed by the ancients both on horſeback and on foot.

It was five feet and a half long; and the ſteel wherewith it was headed, had three ſides, or faces, which all terminated in a point.

The javelin match was one of the Gymnaſtic exerciſes among the ancients, and conſiſted either in throwing a ſtone, or a dart, or ſomething elſe, with the moſt addreſs, and to the greateſt diſtance. Plato (De Leg. l. viii.) admitted two ſorts of "Jaculations," the firſt called τοξικην, and the other ακοντισμα; and Galen informs us, that Apollo and Eſculapius were the inventors of them. The Latins tranſlated the firſt by the word "Sagittatio," and the ſecond by that of "Jaculatio." In thoſe exerciſes they equally employed either a bow or a ſling, or another inſtrument, which they made uſe of for hanging to the arrow a thong which they held in their hand, to take the more ſteady aim.

JAVENBY, in *Geography*, a town of Sweden, in Weſt Bothnia; eight miles S. of Pitea.

JAUER, a principality of Sileſia, bounded on the N. by the principalities of Glogau and Sagan, on the E. by Lignitz and Schweidnitz, on the S. by Bohemia, and on the W. by Bohemia and Luſatia. It is mountainous and covered with wood; and it yields pit-coal and mill-ſtone. The mountains contain various ores, with numerous mines of iron and copper. The warm baths of its mineral ſprings are much frequented. It has 12 towns, and ſeveral large villages, which contain 200 families and upwards; and among their inhabitants are artificers, particularly weavers, whoſe manufactures are purchaſed for exportation. Its earthenware is much eſteemed. Jauer, its capital, is ſituated 16 miles N. of Schweidnitz. N. lat. 51°. E. long. 16° 18′. Its other principal towns are Hirſchberg, Lowenberg, and Bunſlau, which give names to diſtricts.

JAVERDA, a town of Hindooſtan, in Dowlatabad; 10 miles S. of Calberga.

JAUJA, a city of Peru, famous for its manufacture of woollen cloths, and mines of ſilver.

JAVIE, LA, a town of France, in the department of the Lower Alps, and chief place of a canton, in the diſtrict of Digne. The place contains 130, and the canton 2401 inhabitants, on a territory of 75 kiliometres in 10 communes.

JAUJESMOW, a town of Hindooſtan, in Oude; 15 miles N. of Corah. N. lat. 26° 25′. E. long. 80° 46′.

JAULDOE, a town of Bengal; 142 miles N.W. of Calcutta. N. lat. 23° 23′. E. long. 86° 7′.

JAULNO, a town of Hindooſtan, in the circar of Aurungabad; 28 miles N.E. of Aurungabad.

JAUMS, among *Carpenters*, denote the door-poſts, as alſo upright poſts at the end of window-frames.

JAUMS, among *Bricklayers*, &c. the upright ſides of chimnies, from the earth to the mantle-tree.

JAUNDICE, in *Medicine*, from the French *jauniſſe*, (which again is from *jaune, yellow*,) a diſeaſe which is principally characterized by a yellowneſs of the ſkin over the whole body, and of the coats of the eye.

The appellation of *Aurigo* has been alſo given to this diſeaſe, from *aurum, gold*, in alluſion to the yellow colour of the ſkin. The Romans called it *morbus regius*, or the royal diſeaſe, and *morbus arcuatus*, or *arquatus*, the origin of which names has afforded matter of diſpute to the etymologiſts, who have not come to any ſatisfactory concluſion on the ſubject. Celſus believes that it was called *regius*, becauſe it requires *rich* or *royal* fare to cure it. And the term *arcuatus* is ſaid to have originated from the various colours of the ſkin reſembling thoſe of the rainbow. By the Greeks it was denominated ικτερος, *icterus;* whence alſo *icteritia.* Sauvages has adopted this laſt as the title of the ſixth order, of his tenth claſs of diſeaſes, underſtanding by "icteritiæ" (couleurs depravées) morbid changes of the complexion, and denoting jaundice by the term *Aurigo.* See his Noſol. Method. —Alſo, Van Swieten Comment. Aph. 918.—And Celſus, lib. iii. cap. 24.

Jaundice is marked by a yellow colour of the whole ſurface of the body, which is firſt ſeen, and is moſt conſpicuous, in the tunica conjunctiva, or white part of the eyes, and at the roots of the nails. The urine is thick, of a deep yellowiſh brown colour, and tinges linen and other white ſubſtances, immerſed in it, of a yellow hue. The bowels are often coſtive, but ſometimes looſe; and the ſtools are commonly of a very pale and clay-like appearance both in conſiſtence and colour, from the abſence of bile, and have not the uſual fæculent ſmell. This diſeaſe is accompanied with a ſenſe of much laſſitude and languor, and a great inaptitude to exertion; with lowneſs of ſpirits, and a feeling of pain and tenſion, or weight and oppreſſion about the præcordia; there is alſo frequently much anxiety, and ſome degree of difficulty of breathing, as well as a troubleſome ſenſe of itching over the ſkin, unattended by any eruption. Many ſymptoms of indigeſtion are generally preſent; ſuch as nauſea, vomiting, flatulency, and eructations, and loſs of appetite: ſolid food taſtes bitter in the mouth of ſome patients; and in ſome ſtates of the diſeaſe hiccup occurs, and occaſional paroxyſms of rigour or chillineſs. The pain is ſometimes extremely acute in the epigaſtrium, or pit of the ſtomach, or in the right hypochondrium, eſpecially during the paſſage of a gall-ſtone. The ſtate of the pulſe varies much; in general it is ſomewhat quicker than natural; but in ſome caſes, and particularly under the circumſtance juſt mentioned, it is ſlower. There is a popular notion that all objects appear of a yellow colour to patients labouring under jaundice; and, indeed, Galen, Hoffmann, Boerhaave, and Sydenham, all aſſert that they have occaſionally witneſſed that circumſtance. But, on the other hand, Dr. Heberden, and other phyſicians of much obſervation and experience, have never found ſuch a change of viſion in any patient, nor have we ever met with any living practitioner by whom it had been detected. It is not, indeed, an impoſſible caſe, particularly where the diſeaſe has been of very long continuance and great intenſity, when, ſhould the cornea or humours of the eye become impregnated with bile, the light would paſs through a yellow medium, and objects thus be tinged of that colour. But theſe parts are not uſually found impregnated with bile.

The ſymptoms of jaundice originate from the mixture of bile with the circulating blood. In its ordinary ſtate the blood contains no bile, nor any other of the ſecretions, ſuch as urine, ſaliva, &c.; but the bile is generated from the blood, by a different combination of its parts, which is produced by the action of the veſſels of the liver. When thus generated or ſecreted, as the term is, the bile is conveyed to the inteſtines by a duct which opens into the *duodenum*, or upper part of the alimentary canal. Branching from the middle of this duct, however, is another duct, which leads to the gall-bladder, into which the bile regurgitates. This is called the *cyſtic* duct; and that part of the duct of the liver above the branching off of the cyſtic duct, is called ſimply the *hepatic* duct: but the part below, or between this and the inteſtine, being the common channel for the bile from the liver, and for that which had regurgitated into the gall-bladder, is called the "common biliary duct," or *ductus communis choledochus*. Thus much it ſeemed neceſſary to ſtate, in order that our future obſervations may be underſtood. For a minute account of the ſtructure of the parts, ſee Liver.

Now, after the bile is ſecreted, if the hepatic, or the common duct be obſtructed, ſo that the paſſage of the bile into the inteſtine be prevented, it is forced back into the liver, and is taken up by the abſorbent veſſels, and carried into the maſs of the circulating blood, in the ſerum of which it is diſſolved, and thus gives it its own yellow colour. The blood, thus tinged, carries the dye with it to every part of the body, and hence the general hue of jaundice is produced. It would ſeem, however, that the bile, in a liver diſtended by obſtruction of the ducts, is not only taken up by abſorption, but is alſo forced into the mouths of the hepatic veins, according to the obſervations of Dr. Saunders and Dr. Powell. For both theſe gentlemen have witneſſed the preſence of bile in the thoracic duct on diſſection; and Dr. Saunders found the ſerum of the hepatic veins in a dog, in which jaundice had been a ſhort time before produced by a ligature on the common biliary duct, evidently more loaded with the colouring part of bile, than that ſerum in the other veins of the body. (See Saunders's Treatiſe on the Structure, Economy, and Diſeaſes of the Liver. Powell's Obſ. on the Bile and its Diſeaſes, &c. p. 56.) When the bile reaches the circulation, the intenſity of tinge which different parts receive will be in proportion to their vaſcularity, and the quantity of colouring matter thus carried to them; or to the natural hue of the part being more or leſs calculated to ſhew it, as in the eye and white of the nails. All the ſolid parts of the body, except the medullary ſubſtance of the brain, as ſome have affirmed, even the bones themſelves, the fat and the cartilages, have been obſerved to be deeply tinged of a yellow colour. The ſecreted fluids are generally alſo deeply tinged. In caſes of ſome duration, the perſpirable matter is coloured, ſo likewiſe is the ſaliva, which has a very bitter and bilious taſte: but the urine is much more highly impregnated with bile, and more ſpeedily than any other of the ſecretions. Indeed the milk is the only exception which is made by authors; for the affection is ſuppoſed to extend even to the ſemen. (Van Swieten.) As we have already ſtated, however, poetic licence ſeems to have got the ſtart of obſervation, in affirming that the bilious tinge extends to the humours of the eye, which has not been detected by modern inquirers.

> Lucret. lib. iv. v. 333.

is probably without any foundation, as well as Shakſpeare's aſſertion to the ſame purport. (See Heberden, Med. Tranſ. vol. ii. p. 132.) The fluids, which are often preternaturally collected in the cavities of the body, as in thoſe which conſtitute the varieties of dropſy, and thoſe which are accumulated in bladders upon the ſurface, in conſequence of the application of bliſters, or other acrid matters, to the ſkin, are alſo found tinged with bile; and ſo likewiſe is that fluid which, under ſome circumſtances, is collected in the ventricles, and which, in other reſpects, differs materially from the effuſions into other cavities. Powell, loc. cit.

It is generally ſtated that coſtiveneſs attends the jaundice, in conſequence of the want of bile, which is believed to be the principal ſtimulus to the inteſtines. But Dr. Heberden juſtly remarked, that icteric patients are often diſpoſed to have a purging, and that certainly neither of theſe ſtates is peculiar to the diſeaſe: and Dr. Powell obſerves, that the greater number of patients, whom he has attended, have been rather purged than otherwiſe. He remarks, that the degree of the coſtiveneſs militates much againſt the notion, that it originates in a deficiency of bile in the inteſtines. "Suppoſing for a moment," he ſays, "that bile is the ſtimulus imagined, it acts with a definite force, exemplified in the daily occurrence of ſtools: now, under theſe circumſtances, any common purgative ſtimulates the inteſtines ſtill more, and produces more copious evacuations; but where bile is abſent and there is coſtiveneſs, even the ſtrongeſt purgatives fail of their effect, though, as far as their ſtimulating power goes, they muſt infinitely ſurpaſs any quantity of the bile itſelf. If, too, this deficiency was the ſole occaſion of ſo unpleaſant a ſymptom, it might be thought that the bile of animals might be advantageouſly employed for its removal: but even this does not anſwer, nor has a ſcruple of inſpiſſated ox-bile ſtimulated my own inteſtines to more frequent or copious diſcharges. Upon the whole, I think that coſtiveneſs ought not, in this caſe, to be attributed to abſence of bile, and that bile is certainly not the ſtimulus which has been imagined." (P. 87.) This reaſoning is by no means concluſive; but it puts the matter in a probable light.

Cauſes of Jaundice.—The cauſes which obſtruct the paſſage of the bile out of the liver, are to be found in the various circumſtances which can *obſtruct*, *compreſs*, or *diminiſh the calibre* of the biliary ducts, particularly of the ductus communis. Under theſe three heads we ſhall treat of the individual cauſes of the diſeaſe for the ſake of diſcrimination.

I. *Of Obſtruction in the Biliary Ducts*, or of the cauſes which plug up thoſe paſſages. The ductus communis is liable to obſtruction from two cauſes, namely, from gall-ſtones, biliary *calculi*, or concretions, as they have been termed, and from a morbid inſpiſſation or denſity of the bile.

1. *Gall-ſtones* are generally formed in the gall-bladder, and acquire their chief bulk there; but from what cauſe theſe cryſtallizations take place we are altogether unable to ſtate. While they remain in the gall-bladder they are perfectly harmleſs; and when they are very ſmall they readily paſs with the cyſtic bile. The principal inconvenience, then, ariſes upon the accident of their being carried from the cyſt into the narrow ducts. Biliary concretions are very frequently found in the gall-bladder, in the diſſections of dead bodies, when no ſymptom has appeared during the life of the perſon to excite a ſuſpicion of their exiſtence.

When a gall-ſtone is impacted in the duct, a pain, which is often moſt acute and ſevere, ſo as to be hardly ſupportable, but ſometimes moderate, is produced, and is often accompanied by ſhiverings, which afterwards occaſionally recur. The pain is ſeated at the pit of the ſtomach, and ſeems generally to be confined to that point of the epigaſtric region which correſponds to the ſituation of the opening of the common duct into the duodenum, and from this part it appears to dart through to the back: the pulſe at the ſame time continues nearly as ſlow as is natural, and has none of the hardneſs attendant on inflammation. By an attention to the ſeat of the pain and this natural ſtate of pulſe, Dr. Heberden obſerves, that it is not difficult to foretel the outward yellowneſs in many caſes, ſome days before it appears. The breath, during the continuance of the pain, becomes ſhort and hurried; there is great general anxiety and reſtleſsneſs, ſometimes amounting to delirium, and at laſt great depreſſion and fainting; the ſtomach is affected by nauſea and reaching; and there are often irregular ſpaſmodic twitches in various parts of the body. There are often profuſe ſweats, which are, however, ſometimes abſent; and they do not depend at all upon the ſhiverings, for they are ſometimes preſent, when no ſhivering has occurred. Theſe ſymptoms do not continue long in all their violence; for although the patient, during the paſſage of a gall-ſtone, is never free from ſome pain, yet it increaſes, by paroxyſms, to a ſtate of acute ſuffering, and ſubſides again into one of comparative eaſe, during which there is a ſenſe of deep-ſeated ſoreneſs and fulneſs of the epigaſtric and right hypochondriac regions. The greateſt relief from pain is experienced by bending the body forward upon the knees, in which poſition the relaxation of the abdominal muſcles leaves the affected parts ſubjected to the leaſt preſſure. Another fit, perhaps of equal or greater violence than the firſt, then comes on, and alternates with another remiſſion; this may occur ſeveral times in an hour; but ſometimes the duration of the paroxyſm is much longer.

At ſome early period of theſe attacks, the jaundice makes its appearance; and it continues for a conſiderable time after the violent ſymptoms have diſappeared. When the concretion has paſſed, however, and the more urgent ſymptoms have ceaſed, the yellowneſs may ſoon be perceived to diminiſh in its intenſity; but before it can entirely diſappear, it requires that the whole quantity of the tinged ſerum be removed by a gradual operation of the excretory glands, and a freſh ſupply in a natural ſtate be introduced.

The duration of the attack, including the whole time of the paſſage of the concretion, is as various as its intenſity; ſometimes a few hours, ſometimes ſeveral days, or even weeks elapſe, before it is expelled. In the former caſe, the paſſage is often ſo rapid as not to allow time for the jaundice to take place. The number and ſize of the concretions alſo vary much; ſometimes the gall-bladder is filled with them; at other times there are not more than one or two: ſometimes they are ſmall and angular; at others large, and have a more regular ſurface. They have been ſometimes ſeen nearly of the ſize and figure of the gall-bladder itſelf, ſo as almoſt to fill the whole cavity. Theſe large concretions are leſs frequently the cauſe of jaundice than ſmaller ones; for, from their bulk, there is but little probability of their entering the *ductus cyſticus*, and afterwards of obſtructing the *ductus communis:* it is from calculi of ſmaller dimenſions that ſuch obſtructions generally ariſe. It appears, however, that calculi of conſiderable bulk muſt have paſſed; for the *ductus communis* has been found, on diſſection, enlarged to an inch in diameter; an inſtance of which was met with by Dr. Heberden. But concretions have paſſed during life of ſuch a bulk as to occaſion a doubt whether they eſcaped into the inteſtines by the natural canals, or made their way thither by a preternatural paſſage; as by the adheſion of the gall-bladder, in conſequence of inflammation, to the duodenum or colon, after which ulceration had occurred, and opened a communication. Dr. Cheſton, of Glouceſter, ſome years ago met with a caſe where a gall-ſtone of unuſual magnitude paſſed during life, and the patient recovered. Some years afterwards ſhe died of another complaint; and on examination, it appeared that this large gall-ſtone had made a preternatural paſſage through the gall-bladder into the inteſtine. Mr. Cline has an inſtance of the ſame kind in his collection of anatomical preparations, at St. Thomas's hoſpital.

It would be foreign to the purpoſe of this article to enter into a minute account of the varieties of appearance, and the chemical properties of the different biliary concretions. Upon theſe topics the reader will find ſome obſervations under the head of BILIARY *Calculi;* and he will find a moſt ample inveſtigation of the whole ſubject, in Dr. Powell's "Obſervations on the Bile and its Diſeaſes," from page 105 to 133.

The chief circumſtance which ſeems to give riſe to the formation of theſe concretions in the gall-bladder and bile ducts, is a life of indolence and inactivity; it matters not whether it may have been paſſed amid the luxuries of wealth, or the hardſhips of poverty; and if the diſorder be more common in the former ſituation, it is perhaps becauſe neceſſity compels the ſubjects of the latter to more perſonal exertion. Hence theſe concretions are comparatively more frequent in women than in men; thoſe men who are engaged in literary purſuits are very liable to them; and in either ſex they are moſt common after the active period of life is paſt. Haller noticed the frequency of their occurrence in criminals, whoſe death had been preceded by long confinement. (Opuſcula Patholog.) They are often found in the gall-bladders of oxen, which have been ſtalled during the winter months; and Dr. Powell believes that they occur in a larger than common proportion of maniacs who have been long confined. Dr. Saunders explains this influence of a ſedentary life on the bilious ſecretion, by obſerving that the excretory powers of the liver depend but little upon any action which the biliary ducts can perform, as they poſſeſs a very ſmall degree of irritability; but are aſſiſted principally by the agency of the diaphragm and abdominal muſcles, and the periſtaltic motion of the inteſtines; and more eſpecially from the agitation which the hepatic ſyſtem undergoes during bodily exerciſe. The want, therefore, of a degree of exerciſe, ſufficient to aſſiſt the biliary ducts in their excretory function, muſt neceſſarily lay an ample foundation for morbid affections of the bile. And the neceſſity of this external aid to the perfect action of the liver, ſeems more obvious from the circumſtances of its venous circulation, which is always more languid than in thoſe ſecretory organs, where the fluids are kept in a ſtate of more rapid motion by arterial impulſe.

It is commonly ſuppoſed that the biliary concretions are protruded from the ducts by the contractile power of the ducts alone. The truth of this opinion, however, Dr. Pemberton has queſtioned; and he maintains, that the gall-ſtone is propelled by the accumulating bile behind it, which at the ſame time puſhes it forward and diſtends the duct. For, in the firſt place, the duct, he affirms, is always found contracted before the gall-ſtone; whereas, if the concretion were protruded by the contractile power of the duct, it ought to be contracted *behind* it. In the ſecond place, opium and blood-letting are employed as relaxants and antiſpaſmodics, and ſucceſsfully: but this relaxation would rather retard than expedite the paſſage of the calculus, if its protruſion were the reſult of the contractile power. The conſideration is, therefore, of practical importance. See Pemberton on Diſ. of Abdominal Viſcera, p. 55, *et ſeq.*

It may be added, that exceſſive vomiting and violent exerciſe, which have given riſe to jaundice, operated probably by forcing concretions from the gall-bladder into the ducts; and that there is an inſtance on record, in which jaundice aroſe from the ſeeds of gooſeberries, which were found in the extremity of the common duct, as it enters the duodenum. Saunders.

2. The canal of the ductus communis choledochus may be obſtructed or plugged up by the ſecretion of bile of a *morbid denſity* and tenacity, or by the *inſpiſſation of it* in the gall-bladder. Dr. Saunders, ſpeaking of the appearances that have been obſerved on diſſection, ſays, "the bile has been found of a very viſcid and pitchy conſiſtence, eſpecially in the gall-bladder; paſſing from the cyſtic to the common duct, and thereby perhaps reſiſting the paſſage of the more fluid hepatic bile, which would otherwiſe flow freely into the duodenum." The colour of this denſe and inſpiſſated bile is ſtill yellow, according to Dr. Powell, who ſtates, that it does not ſeem to block up the large ducts, nor their entrance into the duodenum, but rather accumulates in the liver itſelf, the deviation from a ſtate of fluidity rendering its paſſage through the ſmaller canals difficult. He conceives that this ſtate of the ſecretion is connected with the uſe of ſpirits. Loc. cit. p. 75 and 145.

II. *Compreſſion of the Biliary Ducts.*—The paſſage of the bile into the inteſtines may be alſo impeded by the various circumſtances under which the common duct, or the hepatic duct is placed in a ſtate of compreſſion; of theſe we may mention the following:

1. *Poſture.*—All perſons, who are engaged in ſedentary occupations, yield very generally to a curved poſture, which, independently of the more remote effects of ſuch modes of life, has ſeemed ſufficient to produce jaundice. It is a well known fact, at leaſt, that under ſuch circumſtances the diſeaſe is particularly frequent. Dr. Powell remarks, that in the neceſſary attention to anatomical diſſection, which is given by young men in their preparation for the profeſſion of phyſic, it is by no means uncommon to find attacks of jaundice, and that too at ſo early a period of their confinement, as can ſcarcely admit of the ſuppoſition that this was the chief exciting cauſe; and in ſome caſes of literary ſtudy the ſame fact is obſerved: now the only circumſtance in common in theſe two ſituations, is the flexure of the body forwards. In ſuch a poſture, the gall-ducts are obviouſly liable to ſuffer conſtant compreſſion between the liver and the inteſtines and other adjoining parts.

2. This compreſſion may be alſo occaſioned by the gravid uterus, in *pregnancy*, towards the latter periods of which jaundice occaſionally occurs. Dr. Powell, however, is inclined to refer the jaundice, produced under ſuch circumſtances, to the plethoric ſtate of the liver, in which the accumulation of blood in that viſcus itſelf is the cauſe of the compreſſion of the ducts; more eſpecially becauſe blood-letting, and other evacuations remove it.

3. *Tumours* of the liver and of the neighbouring viſcera are among the common cauſes of the moſt permanent and ſevere jaundice. A mere congeſtion of blood or turgeſcence of the veſſels throughout the liver, as juſt hinted, from whatever cauſe produced, may be eaſily ſuppoſed to preſs upon and block up the biliary ducts, and thus occaſion the abſorption of that bile, to the ſecretion of which it miniſters. Thus *hepatitis*, or inflammation of the liver, is ſometimes accompanied by jaundice; and would probably be more frequently ſo accompanied, were it not in general confined to a ſmall part of the viſcus, or to its inveſting membrane. Thus, after the intermittent fevers of this country, and the analogous remittents of warmer climates, a jaundice often comes on towards the concluſion; which has been conſidered as forming no very unfavourable prognoſtic; for there does not generally appear to be any other diſeaſe of the liver, in ſuch caſes, than an increaſe of its ſize, with great accumulation of blood through its ſubſtance. Dr. Powell mentions the caſe of a woman who died of conſumption, and whoſe lungs were found to be almoſt one maſs of ulcerated tubercle; within the laſt three days of her life, jaundice had come on to a very intenſe degree. But, on diſſection, the ducts were found free, and the gall-bladder empty, and no external tumour was diſcovered; but in the liver there ſeemed to be a great accumulation of blood; it was much increaſed in ſize, had a looſe texture, and was in every part deeply tinged with bile. Loc. cit. p. 72-3.

Scirrhous tumours of the contiguous parts, as of the head of the pancreas, of the pylorus, and even of the liver itſelf, ſcrofulous enlargements of the lymphatic glands in the capſule of Gliſſon, and ſteatomatous ſwellings of the omentum, are often ſo ſituated as to obſtruct mechanically the paſſage of the bile into the inteſtines; tubercles of the liver have ſometimes alſo operated as extraneous cauſes, and, from their local ſituation, ſtopped the natural courſe of the bile. But the liver is often much enlarged by collections of large tubercles, which yet leave, in their interſtices, a perfect freedom for the action of the veſſels and the paſſage of the biliary ducts; and ſcirrhus of the liver is not uſually a general diſeaſe, but is confined to particular ſpots, which are often out of the way of the biliary paſſages; ſo that it has often been found, on diſſection, to have made conſiderable progreſs without inducing jaundice.

4. Diſtenſion of the large inteſtines by air, which conſtitutes the diſeaſe called *tympanites*, is often accompanied by jaundice. Such a diſtenſion, ariſing to a certain point, muſt impede the influx of the bile into the duodenum, both by its preſſure upon this bowel itſelf, and upon the biliary ducts; and the jaundice ſeems to take place, under ſuch circumſtances, only when the diſtenſion is very conſiderable, and is therefore to be deemed a very unfavourable ſymptom. In a caſe, mentioned by Dr. Powell, the accumulation of air was ſo great, that, very ſpeedily after the appearance of jaundice, the *cæcum* was burſt by it, and the patient of courſe deſtroyed.

III. *The calibre of the biliary ducts being diminiſhed*, independently of internal ſtoppage or external preſſure, jaundice will equally enſue. Two cauſes of this kind are mentioned by medical writers; but it is probable that neither of them are of very common occurrence.

1. *Spaſm* of the common duct, or a ſpaſmodic conſtriction of the duodenum itſelf, and conſequently a cloſing of the aperture of the duct, are particularly mentioned by Dr. Cullen among the cauſes of jaundice, and Dr. Powell deems the fact well eſtabliſhed, although it has often been denied. In ſome way or other, however, jaundice frequently concurs with diſeaſes that are called ſpaſmodic. Thus it is ſaid by Sydenham to come on occaſionally during hyſterics; and it has been obſerved to follow violent fits of anger, and other emotions of the mind. Dr. Heberden denies the accuracy of Sydenham's obſervation, in reſpect to hyſteria, both from his own obſervation, and the authority of many other practitioners. With reſpect to the influence of the paſſions, Dr. Saunders remarks that anger not only augments the quantity of bile ſecreted very conſiderably, but likewiſe vitiates it: hence it is, that, being carried into the duodenum in large quantities, and regurgitated into the ſtomach, it produces the ſame effects as an emetic: and hence

probably the term *choleric*, as applied to paſſionate people. If the *ductus communis* do not tranſmit it as faſt as it is ſecreted, and the gall-bladder is ſo full that it cannot receive the exceſs; then it will be forcibly returned upon the hepatic ſyſtem, and, by entering the blood-veſſels, produce jaundice. (Saunders, p. 235.) Some have ſuppoſed that, during the general commotion of the paſſions, a gall-ſtone may have been puſhed from the bladder into the duct, and thus produced jaundice; but the whole attack has often been too tranſitory, and too free from the general ſymptoms of the paſſage of a gall-ſtone, to allow of ſuch a ſuppoſition. (Powell, p. 70.) The ſymptoms of ſpaſm, affecting the parts in queſtion, are, however, generally conſidered as being ſimilar to thoſe of the paſſage of a concretion. (Pemberton, loc. cit. p. 49.) So that, on the whole, the explanation which Dr. Saunders has given, of the influence of the paſſions in producing a temporary jaundice, appears to be the moſt probable.

2. *A thickening of the coats* of the biliary ducts, by which their calibre muſt be diminiſhed, is mentioned among the leſs common cauſes of jaundice. (See Morgagni De Cauſis, et Sedibus Morborum, Epiſt. xxxvii. art. 10 who mentions an inſtance of the total obliteration of the common duct.) Dr. Saunders remarks that this contraction of the canal of the duct, is produced by the extenſion of diſeaſed ſtructure, originally produced in the ſtomach by the abuſe of ſpirituous liquors, to the biliary ducts. "In the diſſection of thoſe who have been intemperate dram-drinkers, the diſeaſed ſtructure may be traced," he ſays, "from the ſtomach along the courſe of the ductus communis, and I have frequently ſeen theſe ducts ſo contracted and thickened, that they could not tranſmit bile." A ſimilar effect, from inflammation of the liver extending to the gall-bladder and ducts, which often lays the foundation of an incurable jaundice, has been obſerved by Dr. Pemberton: the inflammation of the duct may be removed, he obſerves, but the thickening remains, a permanent evil. Dr. Darwin, however, imagines, that a temporary jaundice may be occaſioned by an inflammatory thickening of the membrane lining the ducts, analogous in its kind to that of the membrane of the noſe in catarrh, and which, like it, ſoon ceaſes, and the jaundice will go off. (Zoonomia, vol. ii. p. 138.) The truth or falſity of this opinion it is not in our power to aſcertain.

In addition to the ſeries of cauſes already detailed, ariſing from obſtruction to the paſſage of the bile into the duodenum, it has farther been a queſtion, whether any obſtruction to its diſcharge from the bowels, after it has cleared its appropriate ducts, may not likewiſe occaſion its abſorption into the ſyſtem, and therefore produce jaundice. It would appear, from an experiment of M. Portal, that this may happen. He paſſed a ligature round the inteſtine of dogs, a little below the opening of the ductus communis choledochus, and obſerved that, in five or ſix hours afterwards, their eyes acquired a yellow tinge; and upon examining the lacteals, he found them filled with bile. (Mem. de l'Acad. des Sciences, ann. 1777.) In ſome of the caſes of obſtinate coſtiveneſs accompanied by jaundice, that are on record, it is probable, therefore, that the jaundice was a ſymptom, rather than a cauſe, of the coſtiveneſs.

This ſeems to be the caſe, in the ſlight jaundice of infants, which ſpeedily vaniſhes when the bowels are unloaded.

Dr. Powell mentions a paralyſis of the gall-bladder as one of the cauſes of jaundice. In this caſe, as in the urinary bladder, the powers of contraction are loſt from overdiſtenſion, and the accumulation of bile is ſaid to have become ſo great, as to produce a tumour externally, with an evident fluctuation, which has induced the ſurgeon to puncture it, under an idea that the collection was *pus*. It is not eaſy to conceive how jaundice ſhould be induced, under theſe circumſtances, except by abſorption from the inner ſurface of the gall-bladder itſelf.

The prognoſis, in jaundice, muſt be obviouſly very different in different inſtances, according to the nature of the obſtruction upon which it depends. In jaundice ariſing from gall-ſtone, or ſpaſm, the prognoſtic is favourable; for, in the latter caſe, the ſpaſm will aſſuredly ceaſe; and, in the former, if the ſtone is ſmall enough to enter the duct, it is moſt likely that it will paſs its whole length, inaſmuch as the canal at the entrance is of leſs diameter, than when it unites with the hepatic duct to form the ductus communis choledochus. If, therefore, jaundice has ariſen ſuddenly in young and vigorous habits (even though accompanied with much pain), and is unattended with fever, and other unfavourable circumſtances to be mentioned, it is ſeldom of long duration, and may be effectually removed. The itching of the ſkin, which ſometimes ſubſides after a few days, Dr. Pemberton obſerves, often returns a day, or even two days, before other evident proofs of the removal of the obſtruction; ſo that he conſiders ſuch a recurrence of the itching as a favourable ſymptom. A bilious diarrhœa coming on, implies the removal of the obſtruction, and muſt therefore be regarded as concluſive with reſpect to the recovery of the patient. A ſmall variation of the yellowneſs cannot be relied upon as a ſymptom of convaleſcence; ſince the colour of the eye and ſkin often undergoes ſlight changes, even during the time when the obſtruction remains the ſame. Pemberton, loc. cit. p. 61.

Among the unfavourable ſymptoms may be reckoned a continuation of the intenſeneſs of the yellow colour in the eye, the pain of the ſtomach remaining equally acute, and confined to the ſame ſpot, and an increaſe of nauſea, while the ſtools and urine continue to retain the unnatural colours before-mentioned. The appearances are very unfavourable, if, with the violent pain, there is alſo a quick pulſe, loſs of fleſh and ſtrength, with occaſional watchfulneſs and melancholy; under theſe circumſtances, the patient becomes ſubject either to profuſe ſweating or hæmorrhagy. Theſe ſymptoms generally mark the preſence of ſome fixed diſeaſe in the viſcera, and the diſeaſe frequently terminates in a confirmed dropſy of the belly.

It muſt not be omitted, that jaundice is a diſeaſe into which the patient is very liable to relapſe, after every appearance of recovery.

Diagnoſis.—It is extremely important, with a view to the proper treatment of jaundice, to diſtinguiſh from which of the cauſes of obſtruction before-mentioned the biliary ducts are impeded. Our concluſions as to the event of the diſeaſe muſt alſo depend entirely upon our knowledge of the nature of the obſtruction. We have in ſome meaſure anticipated the diagnoſtic ſymptoms, in treating of the cauſes; but it cannot be too carefully obſerved, that where gall-ſtone, or ſpaſm of the ducts, is the cauſe of the jaundice, there is moſt acute pain in the pit of the ſtomach, attacking ſuddenly, commonly remitting and recurring in paroxyſms, and often accompanied by vomiting; but at the ſame time the pulſe continues in its natural ſtate, both in reſpect to ſlowneſs and ſoftneſs, which implies the abſence of inflammation. When ſhiverings occur, it may be obſerved that they come on *after* the pain has continued ſome time, and do not precede the pain, as is the caſe with thoſe ſhiverings which attend inflammation.

Jaundice ariſing from compreſſion of the biliary ducts, by tumours of the neighbouring organs, may be diſtinguiſhed by the pain not having come on ſuddenly; by its being leſs acute and varying little in degree; by the circumſtances of the general health, when the jaundice has been preceded by other diſeaſes of long continuance, by waſting of the fleſh and ſtrength, and is accompanied by ſoreneſs or obvious hardneſs in the hepatic or epigaſtric region, and by an increaſed velocity of the pulſe, and when it occurs in the middle or advanced period of life. Even when the jaundice has ſubſiſted long without any intermiſſion, (Dr. Cullen remarks,) and without any pain in the epigaſtrium, an external compreſſion is to be ſuſpected. When to theſe circumſtances a diſpoſition to dropſy is added, there can remain no doubt as to the exiſtence of morbid enlargement of ſome of the viſcera, and of the incurable nature of the diſeaſe.

The *chloroſis*, to which young women are extremely ſubject, puts on, to a ſuperficial obſerver, the appearance of jaundice; and, indeed, the whole body aſſumes, in ſome caſes of this diſorder, ſo much of a yellow colour, as might lead a leſs careleſs obſerver to ſuſpect the preſence of bile. But in all ſuch caſes, the original whiteneſs of the eye remains, or is even increaſed to a pearly whiteneſs, and the urine remains of its natural colour, aſſuring us that the circulating fluids hold no bile in ſolution.

Cure of Jaundice.—As the cure of jaundice conſiſts eſſentially in removing the obſtruction to the free egreſs of bile from the liver, the treatment muſt vary according to the nature of the obſtructing cauſe; and while meaſures are adopted, with a view to remove theſe cauſes, other collateral indications, ſuch as the alleviation of pain, the diminution of inflammation, if any be preſent, and the ſupport of the patient's ſtrength, will require to be fulfilled.

When the ſymptoms lead us to infer, that the jaundice ariſes from the impaction of a gall-ſtone in the duct, the object of remedies will be to facilitate its paſſage into the inteſtinal canal. We know of no certain and immediate means of expediting the paſſage of biliary concretions, which is generally a work of time, depending upon the gradual dilatation of the biliary duct. It proceeds, however, faſter or ſlower upon different occaſions; and therefore the jaundice, after a various duration, often ceaſes ſuddenly and ſpontaneouſly. This circumſtance has given riſe to a belief in the efficacy of a number of remedies, many of which are perfectly inert, and others cannot be ſuppoſed to exert any effect upon the paſſage of a gall-ſtone. Some of theſe, indeed, ſeem to have been recommended for the cure of jaundice, in conſequence of their *yellow* colour; ſuch as ſaffron, the yolk of raw egg, &c.; in the ſame way as the root of madder, which is *red*, has been popularly uſed as an emmenagogue. Of ſuch remedies it is unneceſſary to give any farther account.

But although no immediate evacuation of the obſtructing cauſe be within the power of medicine, yet that proceſs may be facilitated by thoſe means, which are known to abate increaſed action of muſcular fibres, and to diminiſh irritability; *i. e.* by anti-ſpaſmodic and narcotic medicines. Opium is one of the moſt effectual medicines of this claſs; and the benefit, reſulting from its adminiſtration, ſeems to confirm the theory upon which it has been recommended. It fulfils the two-fold indication of relaxing the ſpaſm of the ducts, and alleviating the urgent pain. It is not enough, however, to adminiſter ſmall or even ordinary doſes of this medicine, which, in proportion to the ſeverity of the pain, will produce the leſs effect. The quantity of opium, as Dr. Pemberton enjoins, ought to have no limit but the abſolute alleviation of the pain; and till that object is attained, the patient ſhould take a grain of ſolid opium, or twenty-five drops of the tincture of it every hour. (Pemberton, loc. cit. p. 52.) Or, as is recommended by Dr. Powell, which we believe to be more efficient, he ſhould take a large doſe, ſay two or three grains, in the firſt inſtance, and follow this up by ſmaller doſes, at ſhort intervals, which will prolong the powers of the medicine, and ſometimes the concretion will paſs, while the patient is under its influence. (Powell, p. 155.) A doſe of fifty drops or a drachm of tincture of opium, in a glyſter, will frequently produce immediate relief.

The ſpaſmodic conſtriction of the duct, and the exceſſive pain attendant upon it, may be alſo alleviated, and the paſſage of the concretion facilitated, by the uſe of warm fomentations, applied to the region of the ſtomach and liver, and ſtill more effectually perhaps by immerſion in a warm bath; the temperature of the bath ſhould, however, be properly regulated, as well as the continuance of the immerſion. As the object, in this caſe, is to obtain the ſoothing and relaxing effects, and not the corroborant operation, of the warm bath, its temperature ſhould be from 100° to 110° of Fahrenheit's thermometer, either on the firſt immerſion, or by the application of ſubſequent heat; and the immerſion ſhould be continued till an incipient faintneſs is produced, which, whether it take place after a longer or a ſhorter time, is the beſt criterion to regulate its duration; for where this has not enſued, the bath has not appeared to produce any beneficial effect. Powell.

Several phyſicians, and Dr. Cullen among the reſt, have conſidered the action of vomiting as the moſt probable means of aſſiſting the paſſage of a gall-ſtone through the biliary duct. This action, Dr. Cullen ſays, "by compreſſing the whole abdominal viſcera, and particularly the full and diſtended gall-bladder and biliary veſſels, may contribute, ſometimes gently enough, to the dilatation of the biliary duct." (Firſt Lines, § 1825.) Hence *emetics* have been frequently recommended for the cure of jaundice ariſing from gall-ſtones. Dr. Heberden, apparently by a dereliction of his uſual rational caution, while he admits that vomiting is often an urgent ſymptom of jaundice, from biliary concretion obſtructing the duct, and that the action may even be ſuppoſed to contribute to lacerate the duct, if the concretion be ſtrongly impacted in it; yet he maintains that experience had taught him that vomiting, excited while the pain was intenſe, rather quieted than aggravated the pain, and never brought it on. (Medical Tranſact. of the Coll. p. 160.) He conſiders it, therefore, as a judicious practice, whether the patient have a vomiting or not, to order an emetic, either at firſt, or as ſoon as the intenſeneſs of the pain has been alleviated, and occaſionally to repeat it, watching at the ſame time its operation, and checking it by an opiate, if the ſtraining continue too long, or be too violent. It is true, that no decided injury is ſtated to have been produced by ſuch an exhibition of emetics; yet the theory of their operation, by mere mechanical concuſſion, ſeems very problematical, and experience, on the whole, does not atteſt any very clear proofs of their efficacy. Dr. Cullen admits that gentle emetics alone ſhould be given; and ſuggeſts that, where, by the long continuance of the jaundice, it may be ſuſpected that the ſize of the concretion then paſſing is large; or more eſpecially when pain attending the diſeaſe gives apprehenſion of inflammation, it may be prudent to avoid vomiting altogether. On the whole, the practice muſt be deemed precarious where the diſeaſe is ſevere, and uncalled for where it is mild. When the obſtruction is occaſioned by inſpiſſated bile or mucus about the mouth of the duct, vomiting might remove this, and thus cure the diſeaſe; but a purgative, which is leſs precarious in its operation, is perhaps equally efficacious.

The uſe of *purgatives*, indeed, has been recommended by ſome writers, with a view to aid the expulſion of gall-ſtones from the biliary duct; but the moſt experienced agree that little benefit can be expected to accrue from the uſe of cathartics (except when the bowels are very coſtive), until the concretion ſhall have eſcaped into the inteſtine. There cannot be a doubt, however, that ſlight caſes of jaundice, depending perhaps upon the clogging of the aperture of the duct with inſpiſſated bile, or a very ſmall calculus, are ſpeedily removed in many caſes by cathartics. From the notion that conſtipation aroſe from a deficiency of bile in the inteſtines, the *bitter* purgatives were particularly recommended in jaundice; ſuch as aloes, infuſion of chamomile with tincture of aloes, or colomba with rhubarb and ſoap, &c. As ſoon as the pain is relieved by the remedies already enumerated, and more eſpecially when the relief is complete and ſudden, implying the eſcape of the concretion into the duodenum, it would ſeem to be advantageous to preſerve an open ſtate of the bowels for ſome days, not only for the purpoſe of carrying the concretion out of the body, but to aſſiſt in expediting the diſcharge of the bile tinging the ſerum of the blood, and the healthful renewal of the latter. The choice of the purgative for this purpoſe would ſeem to be not very material; caſtor oil, moderate doſes of calomel ſucceeded by neutral ſalts or rhubarb, &c. repeated every third day, may anſwer the propoſed end.

When there is complete evidence, from the colour of the ſtools, &c. that the obſtruction is removed from the gall-duct, little farther aid from medicine, than the means juſt ſtated, would ſeem to be requiſite. Perhaps, however, the reſtoration of the functions of the ſtomach and adjoining organs may be accelerated by the adminiſtration of ſome aromatic bitter, ſuch as an infuſion of caſcarilla or gentian; or of the abſorbent or antacid medicines, when heart-burn or pain of ſtomach remains.

Such is the treatment to be adopted, whether the jaundice ariſe from ſpaſm merely, or from gall-ſtone, or inſpiſſated bile, ſtopping the duct. Except in the caſe of gall-ſtone, the diſeaſe will ſoon diſappear. But in the latter inſtance, it often happens that the concretion, either from its magnitude or from its angular form, produces inflammation of the duct. It then becomes a more ſerious complaint, and requires the uſe of blood-letting, bliſters, and purgatives, as in other viſceral inflammations. The ſupervention of inflammation is principally marked by the increaſe in the velocity and hardneſs of the pulſe. The tendency to inflammation, indeed, in ſtrong and plethoric habits, from ſuch an irritation in a membranous part as the paſſage of a biliary concretion excites, is ſo great, that experienced phyſicians recommend the employment of blood-letting, by way of precaution, in perſons of moderate vigour, even before the pulſe is quickened, or febrile ſymptoms have ſupervened; and deem it abſolutely requiſite, when the pain is ſevere and the ſlighteſt degree of feveriſhneſs is preſent. (Cullen, loc. cit. § 1824.) One full bleeding, produced from a large orifice in a vein, to the extent of 18 or 20 ounces, in a ſtrong perſon, will be more efficacious than twice the quantity taken at repeated times.

It muſt here be obſerved, that various attempts have been made to diſcover medicines which might act upon the biliary concretions as ſolvents, while they remain in the gall-bladder or biliary ducts. Several ſubſtances have been found to diſſolve the moſt common ones when directly applied out of the body, eſpecially ether, oil of turpentine, ſpirit of wine, and the alkalies; and the combination of the two former, as well as ſolutions of eſſential oils in alcohol, have been adminiſtered internally both in France and this country, and their efficacy ſtrongly atteſted. (See two papers on this ſubject, by M.M. Durande and Maret, in Les Nouveaux Memoires de l'Acad. de Dijon. tom. i. and iii. &c. White's Eſſay on Diſeaſes of the Bile.) But it is to be recollected, that it is altogether impracticable to make a direct application of theſe ſubſtances to calculi in the biliary paſſage; and we have no facts to prove that they can be carried into the gall-bladder, through the medium of the circulating blood, ſo little changed as to preſerve any ſenſible degree of ſolvent power. Dr. Saunders, however, affirms that the alkalies have been found by experience, when taken for ſome continuance, to be ſucceſsful againſt biliary concretions; and it has been generally ſtated, that ſtalled oxen get rid of their biliary calculi when turned out to graſs in the ſpring, which, if it be true, implies the poſſibility of ſome change being effected upon calculi already formed. This ſtatement induced ſome practitioners, who aſcribed the effect to the new food which the cattle obtained, to give *graſs*, or the juice of it, to their human patients affected with jaundice. Van Swieten affirms that he cured a poor labourer by preſcribing a decoction of graſs, ſweetened with honey, for his common drink. (Comment. ad Aph. 950.) But theſe practitioners did not recollect that a free muſcular exerciſe in the open air was an important point in the alteration of the circumſtances of the cattle juſt mentioned; and whether we look to the ſedentary habits of thoſe who are more particularly diſpoſed to jaundice, or to the beneficial effects of exerciſe, eſpecially on horſeback, which experience has aſcertained, in preventing the ſtagnation and viſcidity of the bile (ſee Saunders, p. 255. Powell, p. 161.), we ſhall not be diſpoſed to ſend our jaundiced brethren *to graze* for the recovery of their health.

Acids were long ago conſidered as beneficial in many caſes of jaundice (Baglivi, Prax. Med. lib. i. cap. 9.); and the diluted *nitric acid* has recently been recommended in ſome diſeaſes of the liver. Dr. Powell was hence induced to adminiſter this acid to a patient who was ſubject to frequent attacks of jaundice from biliary concretions; and during the uſe of the acid for eight months he continued free from the diſeaſe. The writer of this article was induced to adminiſter the nitric acid from the ſame conſiderations, and has witneſſed the moſt decided efficacy of the remedy in ſeveral inſtances in which the diſeaſe ſpeedily yielded to its influence again and again, after returning on deſiſting from its uſe. In one caſe, a young lady has experienced from it an invariable cure, and from the diſpoſition to a recurrence of the jaundice has found it expedient to employ it almoſt conſtantly. It may be taken in the proportion of a drachm of the diluted nitric acid to a pint of diſtilled water, or of any vegetable infuſion, daily.

In that ſtate of the liver which produces jaundice towards the end of intermittent fevers, mercury is the beſt and only remedy; and calomel, in ſmall doſes, is the form under which, in this, and ſome other hepatic diſeaſes, it ſeems to act moſt powerfully. Where ſcirrhus of the ſubſtance of the liver, or of the neighbouring organs, operates mechanically by its preſſure upon the ducts, and occaſions jaundice, it is more likely to prove the ſource of permanent miſchief than any other cauſe, and our means of relieving it are leſs effectual. In the true tubercle of the liver, which begins with induration, and afterwards paſſes on to ulceration, the efficacy of any medicine is very doubtful; even mercurials, when given in large quantities, and under any form, have not ſeemed to produce any decided advantage. They are abſolutely injurious, according to the obſervation of Dr. Saunders, when ſymptomatic fever takes place. The chalybeate waters are recommended by the laſt mentioned phyſician, as giving that tone and energy to the ſyſtem ſo very defective in caſes of jaundice.

When jaundice ariſes from a general congeſtion of the veſſels of the liver, general blood-letting, or, if the circumſtances of the conſtitution and ſtrength of the patient forbid that, local bleeding by leeches, or cupping-glaſſes after ſcarification, or the application of bliſters to the hypochondrium, will be uſeful, together with the exhibition of purgatives; and if it be admitted, that torpor of the inteſtinal canal, and a retention of bile or an accumulation of mucus in the duodenum can ſufficiently obſtruct the departure of the bile, and thus occaſion jaundice, as it ſeems to do in young children, the employment of any active purgative will be adequate to its removal. Calomel and jalap are particularly well ſuited to this indication.

Jaundice, *Black*, was diſtinguiſhed from the jaundice, properly ſo called, or *yellow* jaundice, by the ancients, when the ſkin of the patient became of a dark green hue. They conceived it to be occaſioned by a mixture of melancholy, or black bile, with the blood, and to originate from diſeaſe in the ſpleen, which they conceived to be the organ in which the black bile was generated, or from corruption and putrefaction of the yellow bile. It appears to have been nothing more than an intenſe degree of the ordinary jaundice, when the ſkin becomes of a dark or bronze hue, to which this appellation was applied.

Horſes are ſubject to jaundice as well as men. The farriers commonly call it the *yellows*, and divide it, as we do the jaundice, into two kinds, the yellow and the black. The yellow kind is known by the creature's white of his eyes turning to a yellowiſh colour, and his tongue and lips alſo partaking of the ſame tinge, but in a ſmaller degree. In the black kind all theſe parts are tinged with a duſkiſh or blackiſh colour. The common cure among the farriers is by means of an ounce of mithridate diſſolved in two quarts of ſtrong-beer, and given to the horſe warm; and repeating this doſe once in twelve hours, as long as the diſtemper continues.

Jaundice-*Bird*, *icterus*, in *Ornithology*, a name by which ſeveral of the old authors have called the galbula, a bird of the turdus kind, very beautifully coloured all over with a gold yellow, but with black wings. See Oriolus *Galbula*.

JAW, in *Anatomy*, the bone in which the teeth are lodged: there are two, an upper and a lower one. Theſe are deſcribed in Cranium. The joint and muſcles of the lower jaw are conſidered under Deglutition.

Jaw, *Diſlocations of*. See Luxation.

Jaw, *Fractures of*. See Fracture.

Jaw, *Locked*. See Triſmus and Tetanus.

JAWATA, in *Geography*, a town of Japan, in the iſland of Niphon; 90 miles W.N.W. of Meaco.

JAWBERRYA, a town of Bengal; 21 miles N.W. of Calcutta.

JAWOR, a town of Lithuania, in the palatinate of Novogrodek; 48 miles S.S.W. of Novogrodek.

JAWOROW, a town of Poland, in New Galicia, celebrated for its warm baths; 25 miles W. of Lemberg.

JAXARTES. See Sihon.

JAY, Guy-Michael le, in *Biography*, a learned advocate of the parliament of Paris, who flouriſhed in the 17th century, was at an early age profoundly ſkilled in the Oriental languages, and formed, at that period, the noble deſign of publiſhing a polyglott at his own expence. He carried the plan into execution, but it was with the expenditure of all his property. He might have reimburſed himſelf, and have alſo received an ample compenſation for his long and almoſt unremitting labours, if he would have accepted the patronage of cardinal Richlieu, who was ambitious of a ſimilar reputation to that obtained by Ximenes, for patronizing the Spaniſh Polyglott, but M. le Jay choſe to reſerve to himſelf all the glory of the undertaking. On account of his poverty he embraced the eccleſiaſtical life, and obtained a ſmall deanery, but his income was very inadequate to his wants, till cardinal Mazarin made him a magnificent preſent of nineteen thouſand livres. The king likewiſe granted him letters of nobility, and a brevet of counſellor of ſtate as rewards of his learning, zeal, and diſintereſtedneſs. He died in the year 1675. His Polyglott is in ten volumes, folio: it contains the Syriac and Arabic verſions, with their Latin tranſlations, and the Hebrew Samaritan text of the Pentateuch, with the Samaritan tranſlation of the ſame in Samaritan characters. The high price at which this Polyglott was offered for ſale in England, induced Walton to publiſh a ſimilar work, which is more complete and commodious, though not ſo handſome, as M. le Jay's. Moreri.

Jay, in *Geography*, a townſhip of America, in Kennebeck county, and ſtate of Maine, thus named in honour of John Jay, governor of the ſtate of New York. It lies on both ſides of Great Amereſkoggen river, and includes the great bend which, from an eaſterly and weſterly courſe, ſuddenly turns ſoutherly in this townſhip, and paſſes into Livermore, containing 430 inhabitants. The Indian name of this place was "Rochomekoe."

Jay, in *Ornithology*, is the Engliſh name of the Corvus *glandarius*; which ſee.

JAYA, in *Hindoo Mythological Romance*. Jaya and Vijaya were two of the daughters of Dakſha, ſon of Brahma. When Rama went forth to the wars of Lanka, the gods and demigods endowed and armed him with their potencies and weapons. Theſe two ſiſters "of ſlender waiſt," as they are deſcribed in the Ramayan, brought forth a hundred weapons "miſſive and manual," wherewith to arm Rama and his compeers in their arduous conflicts with Ravana, the tyrant of Lanka.

JAYADEVA, in *Biography*, a celebrated Hindoo poet, whoſe lyrics, entitled "Gita Govinda," introduced to the literature of Europe by the elegant pen of the lamented ſir William Jones, ſeem to give him a claim to an elevated rank in that ſpecies of compoſition. The "Gita Govinda" is a paſtoral drama, exhibiting the loves of Kriſhna (under the name of Govind) and his miſtreſs Radha; and although apparently a mere voluptuous rhapſody of paſſion, and that not always devoid of groſſneſs, embelliſhed by exquiſite touches of poetry, it is contemplated in a very different light by the enthuſiaſts of the Gokalaſtha ſect, or the excluſive adorers of Kriſhna. Theſe perſons can diſcover in the "Songs of Jayadeva," as the poem is called, a ſyſtem of emblematical theology: the loves, apparently carnal, of Kriſhna and Radha, mean, they ſay, the reciprocal attraction between the divine goodneſs and the human ſoul; and in this manner the voluptuouſneſs of the poem is explained and loſt. Others of a more ſober caſt paſſionately admire the practical beauties of the Gita Govinda, without admitting it to be a compoſition excluſively ſpiritual. It is certain that a figurative mode of expreſſing the fervour of devotion obtained extenſive prevalence in very early times. Among the Jews, Mahometans, and Hindoos, ſtriking examples can at once be pointed to; not to mention in this place the doctrines promulgated in the ſame glowing ſtile by the illuſtrious Grecian travellers, Pythagoras and Plato, who, it may be ſafely aſſerted, derived many of their tenets, as well as peculiarity of expreſſion, from the myſtics of India and Perſia. See *Myſtical* POETRY.

Jayadeva is believed to have lived anterior to the Chriſtian era, and to have been born at the town of Cenduli, in Kalinga; but as there is a town of a ſimilar name in Berdwan, the natives of it claim the glory of citizenſhip with the fineſt lyric poet of India, and celebrate in his honour an annual jubilee, paſſing a whole night in repreſenting his drama, and ſinging his beautiful ſongs.

JAYADEVI, the conſort of Viſhnu, in an equivocal incarnation under the form of Jina or Jaina, as appears in ſome Hindoo writings. She is repreſented preaching to the females of Kari or Benares, the Jaina doctrine, that "all true religion conſiſted in killing no creature that had life;" a hereſy, according to Brahmanical authors, which gained ſo much ground, as to render an incarnation of Sina the avenger expedient to reſiſt it. This incarnation, they ſay, accordingly took place, in the perſon of a learned bigot named *Sankara*, which ſee.

JAYES, in *Geography*, a town of Hindooſtan, in Oude; 30 miles N. of Manickpour.

JAYGONG, a town of Bootan; 25 miles N. of Beyhar.

JAYNA, a canton, pariſh, and river on the S. ſide of the iſland of St. Domingo; between this river and the Nigua is encloſed an extenſive and fertile plain, which was formerly an abundant ſource of riches to the coloniſts. The quantity of pure gold that was dug from its cavities, its ſugar, cocoa, indigo, and other plantations, paid duties to a greater amount than thoſe now paid by all the Spaniſh part of the iſland. The inhabitants are wholly employed in the breeding of cattle or the waſhing of gold ſand. Indigo grows wild here. Towards the ſource of this river, which at 250 miles from its mouth is not fordable, but croſſed in canoes and ſkins, were the celebrated gold mines of St. Chriſtopher's, near which Columbus erected the fort of that name. On this river there are alſo rich ſilver mines. The eſtabliſhments in the plain of St. Roſe, and thoſe on the Jayna, are reckoned to contain 2000 perſons.

JAYNAGUR, a town of Bengal, ſix miles N.E. of Mahmudpour. N. lat. 23° 28'. E. long. 89° 46'.—Alſo, a town of Bengal; 42 miles N. of Ramgur. N. lat. 24° 21'. E. long. 85° 53'.—Alſo, a town of Hindooſtan, in Bahar; 15 miles N.N.E. of Durbungah. N. lat. 26° 33'. E. long. 86° 20'.

JAYPOUR, a town of Hindooſtan, in the county of Oriſſa; 192 miles W.S.W. of Cattack. N. lat. 19° 5'. E. long. 82° 48'.

JAYSPIZ, a town of Moravia, in the circar of Znaym; 10 miles N. of Znaym. N. lat. 48° 57'. E. long. 15° 53'.

JAZAR, or Jazer, in *Scripture Geography*, a city beyond Jordan, given to Gad, and afterwards to the Levites. (Joſh. xxi. 36. xiii. 25.) It lay at the foot of the mountains of Gilead, near the brook Jazar, which diſcharges itſelf into the Jordan.

JAZIRA, *Deſert of*, a tract of Aſiatic Turkey, extending along the Euphrates from Balis to Anbar. See Gezira.

JAZYGES, in *Ancient Geography*, a people of Scythia, or Sarmatia. Of theſe there were the *Jazyges Mæotæ*, who occupied the northern coaſt of the Palus Mæotis, and were deſtroyed in the 13th century by the kings of Poland; and alſo the *Jazyges Metanaſtæ*, who inhabited the angular territory formed by the Tibiſcus with the Danube. They lived in the vicinity of Dacia, and are called by Pliny "Sarmates." The *Jazyges Baſili*, or royal, were people of Sarmatia, joined by Strabo to the Jazyges on the coaſt of the Euxine ſea. Theſe advanced in proceſs of time to the banks of the Danube, and penetrated to the other ſide of the Sarmatian mountains. They have been ſometimes confounded with the Getæ and Dacians, on account of the reſemblance that ſubſiſted between them in their manners and mode of government. Ptolemy ſpeaks only of the Jazyges Metanaſtæ, who were probably more conſiderable than any of the other Jazyges; and whoſe country was bounded on the N. by European Sarmatia, S. E. by the Sarmatian mountains, as far as mount Carpathus, and W. and S. by that part of Germany which extends from the Sarmatian mountains to the Danube, near Carpis, and thence by a part of this river to the Tibiſcus; and E. by Dacia, from which it is ſeparated by the Tibiſcus. Towards the decline of the empire, this country was occupied by the Vandals, and afterwards became a part of the empire of the Goths. About the year 350 they were expelled by the Huns. It has ſince formed part of Hungary and of Gallicia, and probably alſo of Bannat-Temeſwar.

IBAGUE, in *Geography*, a town of New Granada, in the province of San Juan de los Llanos; containing about 400 inhabitants, one half of them being Indians.

IBALI, a town of European Turkey, in Macedonia, ſituated near Drino Nero; 60 miles W.N.W. of Akrida.

IBAR, or Hibar, a river of European Turkey, which runs into the Morava; 20 miles N. Precop.—Alſo, a town of Servia; 20 miles N. of Novi-Baſar.

IBARRA, Joachim, in *Biography*, born at Saragoſſa in 1725, became printer to the king of Spain, and died in 1785. He carried the typographic art to a degree of perfection which had been unknown in that country. He produced very fine editions of the bible, the Mozarabic Miſſal, Mariana's Hiſtory of Spain, Don Quixotte, and Gabriel's Spaniſh Tranſlation of Salluſt.

Ibarra, in *Geography*, a town of South America, in the province of Quito; 45 miles N.N.E. of Quito. N. lat. 0° 25'. W. long. 77° 40'.

IBAROTI, a town of South America, in Paraguay; 130 miles E. of Aſſumption.

IBAS, in *Biography*, biſhop of Edeſſa, who flouriſhed in the fifth century. He was a Syrian by nation, and appears to have been elected to the ſee of Edeſſa about the year 436. While he was a preſbyter of that church, he wrote a letter concerning the council of Epheſus, and the condemnation of Neſtorius, in which he was thought to favour the Neſtorian doctrine. He was ſeveral times tried upon this charge, and obtained verdicts of acquittal. He was frequently haraſſed, and ſent from one place of confinement to another, till, in the year 451, the council of Chalcedon pronounced his ſentiments orthodox, and decreed that he ſhould be reſtored to the dignity of which he had been deprived. Moreri.

IBBERVILLE, in *Geography*, a river, or a kind of natural canal of Weſt Florida, which joins the Miſſiſippi when it overflows, and forms a communication for veſſels drawing three or four feet, from the Miſſiſippi to the gulf of Mexico, eaſtward, through the lakes Maurepas and Pontchartrain. Its junction with the Miſſiſippi is at the town of Manſhack, in N. lat. 30° 17'.

IBBETSON, Cape, a cape on the N.W. coaſt of Pitt's Archipelago. N. lat. 54° 4'. E. long. 229° 31'.

IBBETSONIA, in *Botany*, ſo named by Dr. Sims in Curtis's Magazine, p. 1259, after an ingenious writer on the ſtructure and phyſiology of plants, in Nicholſon's Journal, Mrs. Agnes Ibbetſon. It is, however, the *Cyclopia* of Ventenat, a genus previouſly publiſhed by that author, and cited by Mr. Brown in the third volume of Mr. Aiton's Hortus Kewenſis, not yet finiſhed.—The plant in queſtion is *Sophora geniſtoides* of Linnæus and Thunberg, *Podalyria geniſtoides* of Willdenow, Sp. Pl. v. 2. 502, and *Gompholobium maculatum* of Andr. Repoſ. t. 427.

IBBOT, Benjamin, in *Biography*, an Engliſh divine, was born at Beachamwell, in Norfolk, in 1680. After he had received the elements of a learned education he was entered of Clare-hall, Cambridge, where he took his degree of B. A. in 1699, and in the following year he removed to Corpus-Chriſti college, and was made a ſcholar of that houſe. He was, in 1707, taken into the family of archbiſhop Tenniſon as librarian, and ſoon after the prelate made him his chaplain. After this he obtained conſiderable preferment in the church, and in 1716 he was appointed one of the chaplains in ordinary to king George I., and when his majeſty viſited the univerſity of Cambridge, in the following year, his chaplain was created doctor of divinity by the royal mandamus. Shortly after he was appointed aſſiſtant preacher to the celebrated Dr. Samuel Clarke, and preſented to the rectory of St. Paul's, Shadwell. In 1724 he was preſented to a prebend at Weſtminſter, and died in the following year. Two volumes of his ſermons were publiſhed for the benefit of his widow by Dr. Clarke in the year 1726: and ſoon after his "Courſe of Sermons preached at the Lecture founded by the Honourable Robert Boyle." Theſe are regarded as maſterly replies to Mr. Collins's "Diſcourſe on Free-Thinking."

IBEIT, in *Geography*, a town of Africa, and capital of a diſtrict, in Kordofan; 140 miles W. of Sennaar. N. lat. 13° 20′. E. long. 31°.

IBEK, in *Biography*, the ſlave of Schehabeddin, ſultan of India, uſurped the throne on the death of his maſter, and added to his dominions many provinces of Hindooſtan. An account of his conqueſts was written in a volume, entitled "Tage al Mather." D'Herbelot. Bibl. Orient.

IBERA, in *Ancient Geography*, a town of Spain, ſeated on the Iberus or Ebro, which is repreſented by Livy (l. xxiii. c. 28.) as a very rich city, when the Romans took it.

IBERIA, Ιβηρια, a name given by the generality of Greek writers to Spain, either from a colony of Iberians, a people bordering on mount Caucaſus, planted there; or from the river Iberus, the Ebro of the moderns, one of the moſt famous rivers of this country. However, the ancients, who lived before Polybius, by Iberia underſtood only that part of Spain extending from the Pyrenees to Calpé, or the ſtraits of Gibraltar, and terminated by the Mediterranean; the other part being unknown to, and conſequently having no name among the Greeks and Romans. The true and proper Iberia is ſuppoſed to have been originally that part of Spain called Celtiberia (which ſee), from a body of Celts who ſettled in it, bounded by the Iberus, the Pyrenees, and the Mediterranean. See Hispania.

Iberia was alſo a country of Aſia, between the Euxine and Caſpian ſeas. According to Ptolemy, it was bounded on the N. by a part of Sarmatia, on the E. by Albania; on the S. by the Greater Armenia; and on the W. by the Colchide. See Georgia.

IBERIS, in *Botany*, Ιβερίς, a name in Dioſcorides, for ſomething of the creſs kind, and therefore not unſuitably retained for this genus.—Linn. Gen. 335. Schreb. 438. Willd. Sp. Pl. v. 3. 452. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 692. Juſſ. 240. Lamarck. Illuſtr. t. 557. Gærtn. t. 141. Claſs and order, *Tetradynamia Siliculoſa*. Nat. Ord. *Siliquoſa*, Linn. *Cruciferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of four obovate, concave, ſmall, ſpreading, equal, deciduous leaves. *Cor.* Petals four, unequal, obovate, obtuſe, ſpreading, with long upright claws; the two external ones much the largeſt, of equal ſize; the two inner very ſmall and reflexed. *Stam.* Filaments ſix, awl-ſhaped, erect, the two lateral ones ſhorteſt; anthers roundiſh. *Piſt.* Germen ſuperior, roundiſh, compreſſed; ſtyle ſimple, ſhort; ſtigma blunt. *Peric.* Pouch erect, nearly orbicular, compreſſed, notched, ſurrounded with an acute border, two-celled; partition lanceolate; valves boat-like, compreſſed, keeled. *Seeds* few, nearly ovate.

Eſſ. Ch. Corolla irregular; its two outermoſt petals largeſt. Pouch emarginate, with ſeveral ſeeds.

This genus is ſingular in its natural order for the unequal petals, conſtituting an irregular flower, and affording a moſt deciſive eſſential character. Reichard obſerves that in I. *rotundifolia* the petals are nearly equal; but we find them by no means ſuch as to invalidate this character.

The ſpecies are eighteen in Willdenow, moſtly herbaceous, half of them annual or biennial, ſome few of the reſt rather ſhrubby. We have two in England, I. *amara*, Engl. Bot. t. 52, found in chalky fields but rare, diſtinguiſhed by its brilliant white flowers, which ſometimes procure it a place in the flower-garden; and I. *nudicaulis*, Engl. Bot. t. 327. Curt. Lond. faſc. 6. t. 42, found here and there on gravelly ground in the ſpring. Both theſe are annual.

I. *ſempervirens* and I. *umbellata* are very frequently cultivated for ornament. The former is perennial and rather ſhrubby, conſpicuous for a profuſion of white bloſſoms, and well calculated to adorn rock-work; the latter, figured in Curt. Mag. t. 106, is a hardy annual, with purple flowers of various dyes.

I. *linifolia* is very nearly allied to the latter, of which indeed Linnæus at one time reckoned it a variety.

IBERUS, in *Ancient Geography*. See Ebro.

IBETI, in *Geography*, a town of Turkiſh Armenia; 33 miles S.S.W. of Akalziké.

IBEX, in *Zoology*, the name of an animal of the goat kind. (See Capra *Ibex*, &c.) This name is alſo given to ſome ſpecies of *Antelope*; which ſee.

IBIBIBOCA, the name of a ſpecies of ſerpent called by the Portugueſe *cobra de coral*. It is about two feet in length, and of the thickneſs of a man's thumb; and tapers off at the tail to a thinneſs, till at laſt it ends in a ſharp point. Its belly is all over white, and very bright and gloſſy; and its head is covered with white ſcales of a cubic figure, and with ſome black ones towards the edges. Its body is variegated with black, white, and red. It is a very ſlow mover; but is of a very terrible and poiſonous kind. Ray.

IBICARAM, a name given by Piſo to a ſpecies of *Cæcilia*; which ſee.

IBIJARA, the name of an American ſpecies of ſerpent, called alſo *bodty*, and by the Portugueſe *cega*, *cobre vega*, and *cobra de las cabeças*. It is of the amphiſbena kind, and is generally ſaid to have two heads, one at each end; but this is wholly erroneous. The head and tail are of the ſame ſhape, and of equal thickneſs, and the creature will ſtrike equally with either; and, as it is ſaid, its poiſon is equally contained at both. It is a ſnake of the ſmaller kind, being of about a foot long, and as thick as one's finger. It is white.

white in colour, and as ſhining and gloſſy as glaſs; and is very elegantly marked with rings and ſtreaks of a brown or copper colour. Its eyes are ſmall, and ſcarcely conſpicuous, looking only like dots made by the point of a needle; it lives under ground, and feeds on ants and other ſmall inſects. It is often thrown up in digging; and the Portugueſe ſay, it is a creature whoſe poiſon is beyond the reach of all the known remedies. Ray.

IBIJAU, in *Ornithology*. See CAPRIMULGUS *grandis*.

IBIPITANGA, in *Botany*. See PLINIA.

IBIRA, a name given by ſome authors to the tree which produces the cubebæ, or cubebs of the ſhops.

IBIRACOA, in *Zoology*, the name of a ſpecies of ſerpent found in the Weſt Indies; whoſe bite is always attended with very terrible effects. It is of a variegated colour, mottled with black, white, and red.

IBIS, in *Ornithology*, the name of an Egyptian bird, ſaid by ſome to be a ſpecies of *Ardea* or *Heron*; by others of *Tantalus*; and by others of *Numenius*, or *Curlew*. See each of theſe articles, and alſo HASSELQUIST. It is ſaid to be peculiar to Egypt, and is there very ſerviceable in deſtroying the ſerpents, locuſts, and other devouring inſects; and hence it was, that, in early ages, they had divine honours paid them. Such is the account given by Herodotus, Diodorus Siculus, and Cicero.

It is remarkable with regard to this bird, that although it lives principally about the Nile, yet it never enters the water, nor can it ſwim. The uſe of glyſters is ſaid to have been learned from the ibis, and not from the ſtork. It generally builds its neſts upon the palm-trees, to avoid the cats. Aldrovandus relates, that the fleſh of the ibis is red, like a ſalmon's, that it is ſweet, that its ſkin is very hard, and ſmells like wild fowl. This ſubject has been treated at large by M. Savigny, in his "Hiſt. Nat. et Myth. de l'Ibis," Paris 1805, 8vo. He firſt traces the deſcription from the ancients, who mention the white ibis and the black, though the latter be not ſtrictly black, but of a deep brown colour, with beautiful metallic reflections. But if the bitumen employed in embalming was too much heated, the feathers of the white ibis became black. That the ibis devoured ſerpents is a mere imagination of the ancients. Like the other birds of its kind, even the red curlew of Cayenne, and the white of Carolina, it could only have devoured worms, little fiſh, and aquatic inſects. At preſent the white ibis is not regarded as reſident in Egypt. According to the report of the inhabitants, theſe birds arrive when the Nile begins to increaſe, probably the real cauſe of the ancient veneration; their number augments as the river riſes, and diminiſhes with its decreaſe, after which they return to Abyſſinia. They would appear to reſide in Egypt about ſeven months, at leaſt in the Delta. The black, or rather brown ibis, arrives and returns later than the white. According to this account the ibis generally arrives in Egypt in June, and retreats in October, though ſome may linger till December.

IBITIN, in *Zoology*, the name of a very large and dangerous ſerpent in the Philippine iſles. This animal twiſts its tail round the trunk of a tree, and ſtrikes its prey, as men, deer, &c. which it entirely devours, and then ſqueezes itſelf againſt the tree, in order to digeſt what it has eaten.

IBITUPOCA, in *Geography*, a town of Brazil, in the province of Minas Geraes; 32 miles S. of Villa Rica.

IBOPETUBA, a ſmall iſland in the Atlantic, near the coaſt of Brazil. S. lat. 25° 33′.

IBRAHIM, in *Biography*, ſultan of the Turks, ſucceeded his brother Amurath or Morad IV. in 1640, being then in his twenty-third year. He had been long a priſoner at the inſtance of Morad, who would have put him to death had he not been prevented by his mother; and ſuch was the ſtate of his mind, that he refuſed admiſſion to the great officers of the government when they came to announce his brother's death, and his own acceſſion to the throne, nor could he be prevailed on to open the doors of his dungeon till the dead body of Morad was laid in his view. Ibrahim was ill fitted for the cares of a crown, and reſigned the duties of his ſtation to his miniſters, contenting himſelf with trifling amuſements and groſs voluptuouſneſs. One of the firſt events of his reign was the capture of Azof, the principal poſt of the Coſſack pirates who infeſted the Black ſea: by which meaſure their depredations were repreſſed, and the navigation rendered clear to Conſtantinople. An attempt was made upon the iſland of Candia, but it was not ſucceſsful. The laſcivious deſires of Ibrahim were the cauſe of his death: he had violated the chaſtity of the beautiful daughter of the Mufti, who, reſolved upon revenge, took ſuch means as to effect the end. He ordered the ſultan to appear before him, which he refuſed: he then declared him an infidel, and incapable of exerciſing the authority of government. The janizaries took the part of the head of the church, and he was almoſt immediately ſtrangled. This was in the year 1649: he left ſeveral ſons, of whom three ſucceſſively filled the throne. Mod. Univer. Hiſt.

IBRAHIM AL-SHIRAZI, a celebrated Muſſulman doctor, a native of Shiraz, the capital of Fars, or Perſia properly ſo called. It is not known at what period he flouriſhed, but he ſuſtains a very high rank among the expounders of the law, and was author of many works in Arabic, very highly eſteemed. The principal of theſe are "An Exhortation to the Study of Juriſprudence;" "The Exemplar," an illuſtration of the principal articles, or, as the Mahometans call them, the foundations of the law. He is ſuppoſed to have been the author of a work on the art of ſcholaſtic diſputation, with the Arabic title, ſignifying "The Search after Truth."

IBRAHIM AL-MEROUZI, a celebrated Muſſulman doctor, who derived his ſurname from the city of Merou, in the province of Koraſan, where he was born. He wrote many pieces in the Arabic language, which are greatly valued; and among others a commentary on the "Mozni," conſiſting of an abridgment of Muſſulman law. At Bagdat, where he reſided, he was conſulted as an oracle in all matters relating to juriſprudence. In advanced life he removed from Bagdat to Cairo in Egypt, where he died in the year of the hegira 340.

IBRAHIM BEN IBRAHIM MEHERAN, one of the celebrated doctors of the ſect of Schafêi, was author of many works of high reputation, of which the chief is a defence of the Muſſulman law againſt the objections of thoſe unbelievers and Atheiſts deſcribed under the Arabic title, ſignifying "Men without Religion." He died in the year 418 of the hegira. A more full account of the perſons juſt mentioned may be found in Herbelot's Bibl. Orient.

IBRAHIM EFFENDI, a native of Poland, who was raiſed by his courage and talents to the principal dignities in the Ottoman empire. He eſtabliſhed the firſt printing-preſs in Turkey. The earlieſt work which he produced was on the military; he afterwards publiſhed the "Account of an Expedition againſt the Afghans;" "A Turkiſh Grammar;" and "A Hiſtory of Turkey."

IBRAHIM, in *Geography*, a mountain of Arabia, in Yemen; 40 miles S. of Chamir.

IBRAHIM *Baſſa*, a river of Syria, anciently *Adonis*, (which ſee),

ſee), that runs into the Mediterranean, about five miles S. of Gibelet.

Ibrahim *Lik*, a town of the Arabian Irak, on the Tigris; 80 miles N. of Bagdad.

IBRAIM, a town of Hungary; 14 miles N.N.E. of Nanas.—Alſo, a river of Perſia, which runs into the Perſian gulf, ſix miles S.W. of Mina.

IBRAS, a town of Lithuania, in the palatinate of Brzeſc; 40 miles S.W. of Pinſk.

IBRIGI, a town of European Turkey, in Romania; 16 miles N.N.W. of Gallipoli.

IBRIM, a town of Africa, in the northern part of Nubia, ſubject to the Turks; 120 miles S. of Syene. N. lat. 22°. E. long. 32° 40′.

IBRIS, a ſmall iſland of Scotland, in the Frith of Forth; three miles N.W. of North Berwick. N. lat. 56° 5′. W. long. 2° 51′.

IBUM. The rabbins give this name to the ceremony of a brother's marrying his ſiſter-in-law, the widow of his brother, deceaſed without children, by virtue of the Moſaic law mentioned in Deut. xxv.

IBURAR, in *Geography*, a town of Aſiatic Turkey, in Caramania; 16 miles N. of Alanieh.

IBURG, a town of Weſtphalia, in the biſhopric of Oſnabruck, having formerly a citadel, which was the epiſcopal palace; 10 miles S. of Oſnabruck.

IBYCUS, in *Biography*, one of the nine celebrated Greek lyrics. Some ſay he was the ſon of a native of Reggio, but born in Meſſina. He was likewiſe a great muſician, and inventor of the inſtrument called Sambuca, of four ſtrings of acute ſound; and according to Euphorion in Athenæus, of the Troglodites, from its reſemblance to the ſambuca, which was triangular. The military inſtrument mentioned by Polybius, lib. viii. was called *ſambuca*.

Ibycus flouriſhed in the 60th olympiad, and the 214th year of Rome. He was author of various works, of which Henry Stephens has collected fragments. The unfortunate Ibycus being attacked by thieves, and begging in vain that they would ſpare his life, when on the point of receiving the blow which left him for dead, he cried out to a flock of cranes that was hovering over him, to bear witneſs againſt his murderers. Some time after, theſe aſſaſſins being in a market, and having ſpied a flock of cranes, ſaid to each other, laughing, there go the witneſſes againſt us for the death of Ibycus. This ſpeech being reported to the magiſtrates, the thieves were put to the torture, when they confeſſed the fact and were hung. Hence came the proverb *Ibyci Grues*, againſt villains whoſe crimes were accidentally diſcovered. The following verſe of Auſonius on the ſubject is well known:

> "Ibycus ut periit, vindex fuit altivolans Grus."

Plato, Plutarch, Athenæus.

IBYNUS. Pere Parran ſpeaks of Ibynus as one of the beſt writers on muſic among the ancients before Boethius, St. Baſil, St. Hilary, St. Auguſtine, St. Ambroſe, St. Gelaſius, &c. Where the good father Parran found this author we know not, as we have never met with his book or his name in our reſearches after the Materia Muſica.

IBYRIESKI, in *Geography*, a town of Lithuania; 32 miles E. of Koniecpole.

ICA, or Yça, or *Valverde*, a town of Peru, in the audience of Lima, and one of three towns, which give name to a province called "Iça Piſco and Naſca." It is ſituated in a valley, and its principal commerce conſiſts in glaſs, wine, brandy, &c.; it contains about 6000 ſouls; 140 miles E.S.E. of Lima. S. lat. 13° 50′. W. long. 75° 28′.

Iça, *Piſco and Naſca, juriſdiction of*, a province of Peru, in the audience of Lima, comprehending about 140 miles along the coaſt of the Pacific ocean, interſected with ſandy deſerts. The oil and wine yielded by this province are excellent, and ſupply the other provinces; and where the land is capable of being watered, it produces corn, maize, and a variety of excellent fruits. The inhabitants near the coaſt are employed in catching fiſh, which they cure and ſend in great quantities into the inland country.

ICACO, in *Botany*. See Chrysobalanus.

ICADES, the name of an ancient feaſt, celebrated every month by the Epicurean philoſophers, in memory of their maſter Epicurus.

The day on which it was held was the twentieth day of the moon, or month, which was that whereon Epicurus was born, and hence came the name *icades*, from εικας, of εικοσι, *twenty*.

They adorned their chambers on this day, and bore his image in ſtate about their houſes, making ſacrifices, &c.

ICARIA, in *Ancient Geography*, an iſland of the Ægean ſea, ſituated W. of the iſle of Samos, E. of that of Delos, and S.S E. of that of Chios.

ICARIAN Sea, that part of the ſea of the Archipelago into which Icarus fell. Thus Diodorus and Ovid deduce its name. "Icarus Icarias nomine fecit aquas." But the learned Bochart ſays, that this part of the Ægean ſea was ſo called upon account of the iſle Icaria, or Icaure, which, in the Phœnician language, imports "fiſhy."

ICARIUM, an iſland of the Perſian gulf, over-againſt the mouth of the Euphrates. Here, according to Strabo, were a temple and oracle of Apollo. Arrian calls it Icaros, Pliny, Ichara, and Ptolemy, who places it on the coaſt of Arabia Felix, calls it Ichara and Icaros.

ICARUS, a river of Aſia, in Scythia, which flowed into the Oxus, according to Pliny.

Icarus, in *Fabulous Hiſtory*, the ſon of Dedalus, who was ſhut up by the king of Crete, with his father, who had favoured the amours of the queen in the labyrinth. As Dedalus knew all its mazes, he found no great difficulty in extricating himſelf; and having gotten a ſhip which Paſiphae had provided for him, he fixed ſails to it, the uſe of which was not then known in Greece, and thus was able to outſtrip Minos's galley which purſued him with oars. His ſon Icarus, having arrived in an iſland very remote from the continent, and endeavouring to land too precipitately, fell into the ſea and was drowned; or, not having ſkill enough to manage his barge, as we learn from Pauſanias (in Bœot.), periſhed near the iſland of Samos. The poets veiled this eſcape under the ingenious fiction of wings, the invention and uſe of which are aſcribed to Dedalus; thus Horace, (Od. l. i.) ſpeaks of them:

> "Expertus vacuum Dædalus aera
> Pennis non homini datis."

The young and adventurous Icarus, it is ſaid, diſregarded the wiſe counſel of his father, who recommended him not to ſoar too high, leſt the heat of the ſun ſhould melt the wax with which his wings were faſtened, while he himſelf flew near the ſurface of the water, and even took care, as Diodorus Siculus remarks, to moiſten his wings from time to time, leſt they ſhould be over-heated; and fell into the ſea.

ICCIUS Portus, or Itius *Portus*, the harbour of Gaul, whence Cæſar embarked his troops for the invaſion of England. Some have referred this harbour to Bologna, others to Witſand, and others to Calais.

ICE, a brittle tranſparent body, formed of ſome fluid, frozen or fixed by cold.

The ſpecific gravity of ice to water is as eight to nine; or the ſpecific gravity of water being 1, that of ice is .93; hence, being lighter than water, it floats upon it. The ſpecific gravity of ice was tried by Dr. Irving, in Phipps's voyage to the north pole; who found, that when a piece of the moſt denſe ice which he could meet with was immerſed in ſnow-water, the thermometer 34°, fourteen fifteenth parts ſunk under the ſurface of the water: in brandy juſt proof, it barely floated; in rectified ſpirits of wine, it fell to the bottom at once and diſſolved immediately. This rarefaction of ice has been ſuppoſed to be owing to the air-bubbles produced in ice while freezing; theſe, being conſiderably large in proportion to the water frozen, render the ice ſo much ſpecifically lighter. Accordingly, it is ſaid, that a conſiderable quantity of air is lodged in the interſtices of water, though it has not there any elaſtic property, on account of the diſunion of its particles; but theſe particles coming cloſer together, and uniting as the water freezes, light, expanſive, and elaſtic air-bubbles are thus generated, and increaſe in bulk as the cold grows ſtronger; whence of courſe the ice grows lighter, and theſe air-bubbles acquiring an elaſtic force burſt to pieces any veſſel in which the water is cloſely contained. But ſnow-water, or any water long boiled over the fire, affords an ice more ſolid than ordinary, and with fewer bubbles. Pure water, long kept in vacuo, and frozen afterwards there, freezes much ſooner, on being expoſed to the ſame degree of cold, than water unpurged of its air and ſet in the open atmoſphere. And the ice made of water thus diveſted of its air will expand in freezing; though it is much harder, more ſolid and tranſparent, and more ponderous than common ice.

But M. de Mairan, in a diſſertation on ice, more juſtly attributes the increaſe of the bulk of the water under this form, principally to a different arrangement of its parts: the icy ſkin on water, being compoſed of filaments which are found to be joined conſtantly and regularly at an angle of 60°, and which, by this diſpoſition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, and in different trials a 14th, an 18th, and a 19th; but when the water was previouſly purged of air, only a 22d part. Beſides, ice, after its formation, continues to expand by cold; a piece of ice, which was at firſt only a fourth part ſpecifically lighter than water, on being expoſed ſome days to the froſt, became a 12th part lighter; and thus he accounts for the burſting of ice in ponds. See CONGELATION, FREEZING, and FREEZING *Mixture*.

To make the moſt perfect ice, we ſhould take the pureſt water, and perfectly purge it of its air by the air-pump; then freeze it in the ſevereſt froſt, by means of Mr. Fahrenheit's contrivance. Thus we obtain an ice of the greateſt hardneſs, denſity, purity, tranſparence, and gravity.

It appears by an experiment of Dr. Hooke, in 1663, that ice refracts the light leſs than water; whence he infers, that the lightneſs of ice, which cauſes it to ſwim in water, is not produced merely by the ſmall bubbles which are viſible in it, but that it ariſes from the uniform conſtitution or general texture of the whole maſs. This fact was afterwards confirmed by M. de la Hire. Hooke's Exper. by Derham, p. 26. Acad. Par. 1693. Mem. p. 25.

Dr. Wollaſton has fully confirmed the obſervation of Dr. Hooke by means of an accurate inſtrument which he has contrived for determining the refraction of different ſubſtances; ſo that ice muſt be conſidered as the leaſt refractive of any known ſubſtances that are not aeriform. The refractive power of ice is ſtated by Dr. Wollaſton, and by Dr. Young, by calculation, from halos, at 1.31. (See REFRACTION.) The capacity for heat of water to ice is as 1.000 to .900; and the heat, in a given meaſure, is as 1.000 to .840.

Ice is known to evaporate as well as water, and ſome ſay in an equal, others, in a greater degree. See EVAPORATION.

In the mountains of Swiſſerland there are immenſe maſſes of ice, which, by the tradition and hiſtories of the country, muſt have lain there many centuries. At certain times there happen cracks in theſe, and by theſe cracks the vaſt thickneſs of the maſſes may in ſome meaſure be gueſſed at; ſome of them being three or four hundred ells deep, and yet none of them ever having gone through the whole thickneſs.

The vaſt bodies of ice met with in the northern ſeas, near Hudſon's bay, are ſurpriſing; ſome of them being immerſed a hundred fathoms or more under the ſurface of the ocean, and a fifth or ſixth part above, and three or four miles in circumference. See Phil. Tranſ. N° 465. ſect. 2.

Theſe floating mountains of ice owe their vaſt bulk and durable nature to a cauſe not conſidered by many; that is, to their not being common ice, but the ice of ſea-water; many experiments proving, that in acid and ſpirituous liquors, when the froſt has power over them, the watery parts only are affected, and the ice is taſteleſs, while the liquor remains concentrated, and much ſtronger than before at the bottom or in the centre. It was generally ſuppoſed that the ſaline liquors, and conſequently ſea-water, were affected by freezing in the ſame manner; that is, its watery part alone was frozen, and the ſalt ſeparated from the part ſo congealed: but Dr. Liſter alleges, that the ice formed of ſea-water is really ſalt, and does contain ſea-ſalt; and finally that it is, by means of this ſalt contained in it, rendered more durable than common ice. If a phial of ſalt-water be expoſed to the air in froſty weather till flakes of ice are found in it, and then brought into a warm room, thoſe flakes will remain even in that place a long time undiſſolved; and if they are taken out and expoſed at a ſmall diſtance to the fire, they will not run into water as common ice would, but they will by degrees evaporate, and there will be left only a little white ſalt.

Since ſea-water, when frozen, thus forms a very durable ice, it appears eaſy to conceive, that the immenſe maſſes of ſuch ice found in the northern ſeas ſhould continue undiſſolved through the whole year, and at the return of the freezing ſeaſon remaining of the ſame bigneſs as at firſt, they muſt of conſequence then become much bigger by the freezing of more ice about them; and thus continuing to loſe very little, and that only by accidents, and annually to increaſe a great deal, it is not wonderful that they become ſo large. Phil. Tranſ. N° 167. 836. See *Sea*-WATER.

But there have been different opinions with regard to the origin of thoſe vaſt piles of ice, reſembling whole iſlands, in the northern regions. Some aſcribe them to ſnow, which falling in great abundance in theſe cold climates, and melting in the ſea, accumulates gradually, till thoſe huge heaps are at length formed: but the more common opinion is, that this ice is formed from the freſh waters which flow from the neighbouring lands. It is certain that great quantities of floating ice are diſcharged by the river Oby, and kept in a ſtate of conſtant agitation by it. Bartoli has written an Italian treatiſe expreſsly on ice and coagulation. And the Acta Eruditorum furniſh us with an account of a French author on the ſame ſubject. See COAGULATION, COLD, and CRYSTALLIZATION.

The formation or coagulation of ice-iſlands has not yet been thoroughly inveſtigated. Captain Cook (Second Voyage, vol. ii. p. 240.) objects to the opinion of thoſe who aſcribe them to the freezing of the water at the mouths of large rivers, or great cataracts, where they accumulate till they are broken off by their own weight. He ſays that no ice was found incorporated with earth, or any of its produce, which muſt have been the caſe, if it had been coagulated in land-waters. He doubts whether there be any rivers in the countries to which he refers: "it is certain," he ſays, "that we ſaw not a river or ſtream of water on all the coaſt of Georgia, nor on any of the ſouthern lands. Nor did we ever ſee a ſtream of water run from any of the ice-iſlands. How are we then to ſuppoſe that there are large rivers? The vallies are covered, many fathoms deep, with everlaſting ſnow; and, at the ſea, they terminate in icy cliffs of vaſt height. It is here where the ice-iſlands are formed; not from ſtreams of water, but from conſolidated ſnow and ſleet, which is, almoſt continually, falling or drifting down from the mountains, eſpecially in the winter, when the froſt muſt be intenſe. During that ſeaſon, the ice-cliffs muſt ſo accumulate as to fill up all the bays, be they ever ſo large. This is a fact which cannot be doubted, as we have ſeen it ſo in ſummer. Theſe cliffs accumulate by continual falls of ſnow, and what drifts from the mountains, till they are no longer able to ſupport their own weight; and then large pieces break off, which we call "ice-iſlands." Such as have a flat even ſurface muſt be of the ice formed in the bays and before the flat vallies: the others, which have a tapering unequal ſurface, muſt be formed on, or under the ſide of a coaſt compoſed of pointed rocks or precipices, or ſome ſuch uneven ſurface. For we cannot ſuppoſe that ſnow alone, as it falls, can form, on a plain ſurface, ſuch as the ſea, ſuch a variety of high peaks and hills, as we ſee on many of the ice iſles. It is certainly more reaſonable to believe that they are formed on a coaſt whoſe ſurface is ſomething ſimilar to theirs. I have obſerved that all the ice-iſlands of any extent, and before they begin to break to pieces, are terminated by perpendicular cliffs of clear ice or frozen ſnow, always on one or more ſides, but moſt generally all round. Many, and thoſe of the largeſt ſize, which had a hilly and ſpiral ſurface, ſhewed a perpendicular cliff or ſide from the ſummit of the higheſt peak down to its baſe. This to me was a convincing proof that theſe, as well as the flat iſles, muſt have broken off from ſubſtances like themſelves; that is, from ſome large tract of ice."

"Theſe ice cliffs," captain Cook apprehends, "extend a good way into the ſea, in ſome parts, eſpecially in ſuch as are ſheltered from the violence of the winds. It may even be doubted if ever the wind is violent in the very high latitudes. And that the ſea will freeze over, or the ſnow that falls upon it, which amounts to the ſame thing, we have inſtances in the northern hemiſphere. The Baltic, the gulf of St. Lawrence, the ſtraits of Belle-Iſle, and many other equally large bays, are frequently frozen over in winter. Nor is this at all extraordinary; for we have found the degree of cold at the ſurface of the ſea, even in ſummer, to be two degrees below the freezing point; conſequently, nothing kept it from freezing but the ſalt it contains, and the agitation of its ſurface. Whenever this laſt ceaſeth in winter, when the froſt is ſet in, and there comes a fall of ſnow, it will freeze on the ſurface as it falls, and in a few days, or perhaps in one night, form ſuch a ſheet of ice as will not be eaſily broken up. Thus a foundation will be laid for it to accumulate to any thickneſs by falls of ſnow, without it being at all neceſſary for the ſea-water to freeze. It may be, by this means, theſe vaſt floats of low ice are, in the ſpring of the year, formed, and which, after they break up, are carried by the currents to the north."

The northern ice extends about 9° from the pole; the ſouthern 18° or 20°; in ſome parts even 30°; and floating ice has occaſionally been found in both hemiſpheres as far as 40° from the poles, and ſometimes, as it has been ſaid, even in latitude 41° and 42°. Between 54° and 60° ſouth latitude, the ſnow lies on the ground, at the ſea ſide, throughout the ſummer. The line of perpetual congelation is three miles above the ſurface at the equator, where the mean heat is 84°; at Teneriffe, in latitude 28°, two miles; in the latitude of London, a little more than a mile; and in latitude 80° north, only 1200 feet. At the pole, according to the analogy deduced by Mr. Kirwan, from a compariſon of various obſervations, the mean temperature ſhould be 31°. In London, the mean temperature is 50°; at Rome and at Montpelier, a little more than 60°; in the iſland of Madeira, 70°; and in Jamaica, 80°. See Congelation, Cooling, and Temperature.

Sir Robert Barker has particularly deſcribed the proceſs of making ice in the Eaſt Indies, where, during his time, he has never ſeen any natural ice. For this purpoſe they dig, on a large open plain, three or four pits, about thirty feet ſquare, and two deep each; the bottoms of which they cover about eight inches or a foot thick with ſugar-cane, or the ſtems of the large Indian corn, dried. On this bed are placed in rows a number of ſmall ſhallow unglazed earthen pans, formed of a very porous earth, a quarter of an inch thick, and about an inch and a quarter deep; which, at the duſk of the evening, they fill with ſoft water that had been boiled. In the morning, before ſun-riſe, the ice-makers attend at the pits, and collect what was frozen in baſkets, which they convey to the place of preſervation. This is generally prepared on ſome high dry ſituation, by ſinking a pit fourteen or fifteen feet deep, lining it firſt with ſtraw, and then with a coarſe kind of blanketing. The ice is depoſited in this pit, and beat down with rammers, till at length its own accumulated cold again freezes it, and forms one ſolid maſs. The mouth of the pit is well ſecured from the exterior air with ſtraw and blankets, and a thatched roof is thrown over the whole. The quantity of ice formed by the method above deſcribed, depends on a light atmoſphere, and clear ſerene weather. Phil. Tranſ. vol. lxv. pt. ii. art. 22. See Cooling, and Cooling *of Liquors*.

Ice-*bergs* are large bodies of ice filling the vallies between the high mountains in northern latitudes; the face of which towards the ſea is nearly perpendicular, and of a very lively light green colour. Some of theſe are at leaſt three hundred feet high.

Ice, *Blink of the*. See Blink *of the Ice*.

What is called the ice-blink in Greenland is an amazing congeries of ice, at the mouth of an inlet, the ſplendour of which is diſcerned at the diſtance of many leagues. It is ſaid to extend in magnificent arches for about 24 miles.

Ice-*boat*, in *Nautical Affairs*, is a kind of barge, having a ſquare and very ſloping head, made very ſtrong and ſhod with iron, which is drawn along canals by ſeveral horſes, during froſts, to break the ice, when it is not too thick to be thus broken, and there is a proſpect of its not forming again. A light kind of flat-bottomed boat has ſometimes been uſed *on* the ice, for the purpoſe of reſcuing ſkaiters and others, where the ice has broken in, and ſuch are alſo called ice-boats, of which a model by count Berſhtold is preſerved in the Repoſitory of the Society of Arts in the Adelphi. Claſs iv. N° 134, which is deſcribed vol. x. p. 277 of the Society's Tranſactions.

Ice-*borne*, in *Geology*, is employed to deſcribe the manner in which large fragments of rocks have been tranſported, to places far diſtant from their native ſituations, on maſſes of ice, floating on the ocean, before it had been reduced to its preſent limits: according to the theory of Mr. Jameſon, Geognoſy, vol. iii. p. 33. Mr. Playfair ſuppoſes, in his illuſtration of the Huttonian theory, § 348, that glaciers or inclined planes of ice, exiſting on the ſurface of the earth, previous to the excavation of vallies, were the means of tranſporting many of ſuch blocks, thoſe of granite in particular; an opinion ably combated by M. De Luc, in his Geology, § 234: but whoſe explanation of this important and very common phenomenon, *viz.* that they were projected into the air, from chaſms, or fiſſures in the earth, extending down to certain great ſubterranean caverns, by the force of vaſt currents of air and water iſſuing therefrom, ſeems (ſays Mr. Farey) leſs probable, than that recently offered by himſelf, *viz.* that the extraneous blocks of ſtone, and all other alluvial matters found on mountains and hills, were tranſported during the diſturbed and reverſed-action of gravity, occaſioned by the perigeic viſits of a former ſatellite. See Philoſophical Magazine, vol. xxxvi. p. 6.

ICE-*cream*, *Method of making*. Take a ſufficient quantity of cream, and, when it is to be mixed with raſpberry, or currant, or pine, a quarter part as much of the juice or jam as of the cream; after beating and ſtraining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter veſſel, and varying in ſize and ſhape at pleaſure; cover the mould, and place it in a pail about two-thirds full of ice, into which two handfuls of ſalt have been thrown; turn the mould by the hand-hold with a quick motion to and fro, in the manner uſed for milling chocolate, for eight or ten minutes; then let it reſt as long and turn it again for the ſame time; and having let it to ſtand half an hour, it is fit to be turned out of the mould, and to be ſent to table.

Lemon juice and ſugar, and the juices of various kinds of fruits, are frozen without cream, and when cream is uſed, it ſhould be well mixed.

ICE-*houſe*, in *Gardening*, a ſort of building ſunk in the ground for the purpoſe of preſerving ice for uſe during the ſummer ſeaſon, when the weather becomes hot.

Situation.—The proper ſituation for an ice-houſe, is that of a dry ſpot of ground; as wherever there is moiſture the ice will be liable to diſſolve; of courſe in all ſtrong ſoils, which retain the wet, too much care cannot be taken to make drains all round the houſes to carry off moiſture; as when this is lodged near them, it will occaſion a damp, which is always prejudicial to the keeping of ice in them.

The aſpect of ice-houſes ſhould be towards the eaſt or ſouth-eaſt, for the advantage of the morning ſun to expel the damp air, as that is more pernicious than warmth; for which reaſon, trees in the vicinity of an ice-houſe tend to its diſadvantage.

The beſt ſoil for an ice-houſe to be made in is chalk, as it conveys away the waſte water without any artificial drain; next to that, looſe ſtony earth, or gravelly ſoil.

The places ſhould likewiſe be elevated, that there may be deſcent enough to convey off any wet that may happen near them, or from the ice melting; and alſo as much expoſed to the ſun and air as poſſible; not under the drip, or in the ſhade of trees, as is too often the practice, under the ſuppoſition, that if expoſed to the ſun, the ice will melt away in ſummer, which never can be the caſe where there is ſufficient care taken to exclude the external air, as the heat of the ſun can never penetrate through the double arches of the buildings, ſo as to add any warmth to the internal air; while, when entirely open to the ſun and wind, all damps and vapours are readily removed.

Shape.—The external form of the building may be according to the fancy of the owner; but for the well, into which the ice is put, a circular form is the moſt convenient; the depth and diameter of it being proportioned to the quantity of ice wanted; but it is always beſt to have ſufficient room, as when the houſe is well built it will keep the ice two or three years: and there will be this advantage in having it large enough to contain ice for two years' conſumption, that if a mild winter ſhould happen, when there is no ice to be had, there will be a ſtock to ſupply the want in the houſe already.

Where the quantity wanted is not great, a well of ſix feet diameter, and eight feet deep, will be large enough, but for a large conſumption, it ſhould not be leſs than nine or ten feet diameter, and as many deep: where the ſituation is either of a dry chalky, gravelly, or ſandy kind, the pit may be made entirely below the ſurface of the ground; but in ſtrong loamy, clayey, or moiſt ground, it will be better to raiſe it ſo high above the ſurface, as that there may be no danger from the wetneſs of the ſoil about it.

At the bottom of the well there ſhould be a ſpace about two feet deep left, for receiving any moiſture which may drain from the ice, and a ſmall underground drain ſhould be laid from this, to carry off the wet; over this ſpace ſhould be placed a ſtrong grate of wood, to let the moiſture fall down which may at any time happen, from the melting of the ice. The ſides of the well muſt be walled up with brick or ſtone at leaſt two feet thick; but if it be thicker it will be better, as the thicker the walls are made, the leſs danger there is of the well being affected by external cauſes. When the wall of the well is brought within three feet of the ſurface, there muſt be another outer arch or wall begun, which muſt be carried up to the height of the top of the intended arch of the well; and if there be a ſecond arch turned over from this, it will add to the goodneſs of the houſe; but this muſt depend on the perſon who builds going to the expence. When not, the plate into which the roof is to be framed muſt be laid on this outer wall, which ſhould be carried high enough above the inner arch to admit of a door way in, to get out the ice. Where the building is to be covered with ſlate or tiles, there ſhould be a thickneſs of reeds, ſtraw, or other ſimilar materials laid under, to guard againſt the effects of the ſun and external air; where they are laid two feet thick, and plaſtered over with lime and hair, there will be no danger of the heat penetrating in ſuch a way as to prove injurious.

The external wall of the houſe need not be built circular, but of any other form, as ſquare, hexangular, or octangular; and where it ſtands much in ſight may be ſo contrived as to make it a pleaſing object to the ſight.

But ice-houſes may be built in ſuch a manner as to have alcove ſeats in the front, having paſſages to get out, and put in the ice behind them; or the entrance may be behind, to the north; ſmall paſſages being left next the ſeats, through which to enter to take out the ice, a large door being contrived with a porch wide enough for a ſmall cart to back in, to ſhoot down the ice upon the floor near the mouth of the well, where it may be well broken before it is put down. The aperture of this mouth of the well need not be more than two feet and a half in diameter, which will be large enough to put down the ice, a ſtone being left to ſtop it with, which muſt be cloſed up as ſecurely as poſſible after the ice is put in, and all the vacant ſpace above and between this and the outer door be filled cloſe with barley ſtraw, or other ſimilar materials to exclude the external air from entering.

The door to enter by for taking out the ice ſhould be no larger than is abſolutely neceſſary for the coming at the ice, and muſt be ſtrong and cloſe to exclude the air, and at five or ſix feet diſtance from this another door ſhould be contrived, which ſhould be cloſely ſhut before the inner door is opened, whenever the ice is taken out of the houſe.

When the houſe is thus finiſhed, it ſhould have time to dry before the ice is put into it; as when the walls are green the damp of them frequently diſſolves the ice. And at the bottom of the well, upon the wooden grate, ſome ſmall faggots ſhould be laid; and if upon theſe a layer of reeds be placed ſmooth for the ice to reſt upon, it will be better than ſtraw, which is commonly uſed.

Proper ſort of Ice.—In the choice of the ice, the thinner it is the better it may be broken to powder; as the ſmaller it is broken the better it will unite when put into the well. In putting it in, it ſhould be rammed cloſe, and a ſpace left between it and the wall of the well, by ſtraw being placed for the purpoſe, ſo as to give paſſage to any moiſture that may be collected by the diſſolving of the ice on the top or otherwiſe.

In putting the ice into the houſe, ſome mix a little nitre with it, to make it congeal more fully; but this is not neceſſary.

As the ice becomes ſolid in the well, an iron crow is neceſſary to take it up with.

The ice-houſe is, as has been ſeen, capable of being made an ornamental building; but this is ſeldom done; it being generally placed in a ſequeſtered ſpot, on the ſide of a hill or ſloping ground, the baſe of which is lower than the bottom of the well, the outſide being well banked up with earth, to keep out all external air and heat, and neatly covered with turf or thatch.

To conſtruct an ice-houſe, firſt chooſe a proper place at a convenient diſtance from the dwelling-houſe or houſes it is to ſerve: dig a cavity (if for one family, of the dimenſions ſpecified in the deſign) of the figure of an inverted cone, ſinking the bottom, concave, to form a reſervoir for the waſte water till it can drain off; if the ſoil requires it, cut a drain to a conſiderable diſtance, or ſo far as will come out of the ſide of the hill, or into a well, to make it communicate with the ſprings, and in that drain form a *ſtink* or *air-trap*, marked *l* (*Plate* XX. *Miſcellany*, *fig.* 5.) by ſinking the drain ſo much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will conſtantly be in the trap, and will keep the well air-tight. Work up a ſufficient number of brick piers to receive a cart-wheel, to be laid with its convex ſide upwards to receive the ice; lay hurdles and ſtraw upon the wheel, which will let the melted ice drain through, and ſerve as a floor. The ſides and dome of the cone are to be nine inches thick, the ſides to be done in ſteened brickwork, *i. e.* without mortar, and wrought at right angles to the face of the work; the filling-in behind ſhould be with gravel, looſe ſtones, or brick-bats, that the water which drains through the ſides may the more eaſily eſcape into the well. The doors of the ice-houſe ſhould be made as cloſe as poſſible, and bundles of ſtraw placed always before the inner door to keep out the air.

Deſcription of the parts referred to by the letters:

a The line firſt dug out.
b The brick circumference of the cell.
c The diminution of the cell downwards.
d The leſſer diameter of the cell.
e The cart wheel, or joiſts and hurdles.
f The piers to receive the wheel or floor.
g The principal receptacle for ſtraw.
h The inner paſſage,
i The firſt entrance,
k The outer door,
} each of theſe paſſages has a ſeparate door.
l An air-trap.
m The well.
n The profile of the piers.
o The ice filled in.
p The height of the cone.
q The dome worked in two half-brick arches.
r The arched paſſage.
s The door-ways inſerted in the walls.
t The floor of the paſſage.
u An aperture through which the ice may be put into the cell; this muſt be covered next the crown of the dome, and then filled with earth.
x The ſloping door, againſt which the ſtraw ſhould be laid.

The ice, when to be put in, ſhould be collected during the froſt, broken into ſmall pieces, and rammed down hard in the ſtrata of not more than a foot, in order to make it one complete body; the care in putting it in, and well ramming it, tends much to its preſervation.

In a ſeaſon when ice is not to be had in ſufficient quantities, ſnow may be ſubſtituted.

Ice may be preſerved in a dry place under ground, by covering it well with chaff, ſtraw, or reeds. Phil. Tranſ. N° 84. p. 140. See Snow.

Great uſe is made of chaff in ſome places of Italy to preſerve ice: the ice-houſe for this purpoſe need only be a deep hole dug in the ground on the ſide of a hill, from the bottom of which they can eaſily carry out a drain, to let out the water which is ſeparated at any time from the ice, that it may not melt and ſpoil the reſt. If the ground is tolerably dry, they do not line the ſides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole; this pit they fill either with pure ſnow, or elſe with ice taken from the pureſt and cleareſt water; becauſe they do not uſe it as we do in England, to ſet the bottles in, but really mix it with the wine. They firſt cover the bottom of the hole with chaff, and then lay in the ice, not letting it any where touch the ſides, but ramming in a large bed of chaff all the way between: they thus carry on the filling to the top, and then cover the ſurface with chaff, and in this manner it will keep as long as they pleaſe.

When they take any of it out for uſe, they wrap the lump up in chaff, and it may then be carried to any diſtant place, without waſte or running. Phil. Tranſ. N° 8. See Ice.

Ice, *Palace of*, a palace built of ice by the empreſs Anne of Ruſſia, on the bank of the Neva in 1740, 52 feet long, which, when illuminated, had a ſurpriſing effect.

Ice-*plant*, in *Botany*. See Mesembryanthemum.

ICELAND, in *Geography*, the largeſt iſland in Europe next to Great Britain, is ſurrounded by that part of the northern ſea which geographers have called the Deucaledonian ocean. Its length, from the moſt weſtern cape to the moſt eaſtern, is about 260 Britiſh miles, and its breadth from north to ſouth about 200 miles. Mallet indeed reckons its length from eaſt to weſt at about 112 Daniſh miles (12 to a degree), and its mean breadth 50 of thoſe miles. The number of its inhabitants is eſtimated at about 50,000, or one to the ſquare mile. Nature herſelf hath marked out the diviſion of this iſland. Two long chains of mountains run from the middle of the eaſtern and weſtern coaſts, riſing by degrees till they meet in the centre of the iſland, from whence two other chains of ſmaller hills gradually deſcend till they reach the coaſts that lie N. and S.; thus making a primary diviſion of the country into four quarters (fierdingers), which are diſtinguiſhed by the four points of the compaſs towards which they lie. The whole iſland can be conſidered only as one vaſt mountain, interſperſed with long and deep vallies, concealing in its boſom heaps of minerals, of vitrified and bituminous ſubſtances, and riſing on all ſides out of the ocean in the form of a ſhort blunted cone. Earthquakes and volcanoes have through all ages deſolated this unhappy iſland, “while it abounds in ſulphur and ſubterranean fires, and volcanoes appear in every quarter. It would be too bold a theory (ſays Pinkerton), to ſuppoſe that ſo wide an expanſe was ejected from the ſea; not to mention that the ſurturband, or carbonated wood, found at a great depth, evinces a moſt remote vegetation. The higheſt mountains clothed with perpetual ſnow are ſtyled “Yokuls;” and of theſe Snæfial, hanging over the ſea in the S. W. part of the iſland, is eſteemed the higheſt, being computed at 6860 feet. The mountains are ſaid to be chiefly ſand-ſtone, pudding-ſtone, with petro-ſilex, ſteatite, and argillaceous ſchiſtus. The calcareous ſpar of Iceland is celebrated ſince the days of Newton for its double refraction: calcedony, zeolite, lava, pumice, black obſidian, and malachite, or copper ſtalactites, are among its mineral productions.” Of *Hecla* we have already given an account under that article. The mountains of Krabla, near Mywatn, in the N. W., and of Kattlegia, were more known than Hecla by their eruptions in the 18th century. The mountains of Iceland exhibit indications of their containing iron, copper, and ſilver ore. In this iſland there are no ſalt ſprings, but ſalt has been found at the foot of the volcanoes or burning mountains. Woods rarely occur, but many large trees are driven hither by the ſea, eſpecially on the N. coaſt, where, for want of ſhipping to export it for ſale, it is ſuffered to lie and rot. Shrubs, on which grow all ſorts of berries, as juniper-berries, black-berries, &c. are burnt in great abundance every year for charcoal, uſed by the natives in their forges. On ſome of the mountains, many of which, conſiſting merely of rocks and ſand, are barren, there are plains of ſeveral miles in extent covered with verdure and producing fine graſs; between other mountains diſperſed over the iſland, there are vallies which afford plentiful nouriſhment for cattle. The fineſt paſtures are in the northern parts of the iſland, where the graſs ſprings rapidly and to a great height. The cattle are generally driven among the mountains to graze, where they find good paſture; but the graſs that grows near the habitations of the Icelanders is reſerved for winter fodder. Iceland, though a very mountainous country, is interſected with roads which are paſſable for horſes; and carriages, which were formerly uſed, being now laid aſide, ſome hundreds of pack-horſes paſs annually over the mountains from the north to the trading places in the ſouth parts of the iſland; and theſe are loaded with butter, woollen manufactures, &c. which are bartered for other commodities. The boiling ſprings of Iceland preſent a ſingular phenomenon; that of Geyſer to the N. of Skallholdt is the moſt remarkable, riſing from an aperture 19 feet in diameter, and ſpringing at intervals to the height of 50 or even 90 feet. The chief rivers of Iceland are in the eaſt; the Skalfande, the Oxarfird, and the Brua, all flowing from the S. to the N. ſome are white with lime, and others ſmell of ſulphur. The common fuel of the country is turf, ſome of which emits a ſtrong ſulphureous ſmell; and even fiſh-bones are burnt in ſome parts of the iſland. Iceland affords a great variety of ſalubrious and medicinal herbs; bread is little known among the common people, who cannot purchaſe that which is imported into the harbours; but ſubſiſt chiefly on freſh and dried fiſh, and alſo on milk, oatmeal, and fleſh. In times of ſcarcity they are conſtrained to prepare flour of various plants deſcribed by Von Troil; and their common drink is milk, and alſo a liquor called “Syra,” which is ſour whey, kept in caſks and left to ferment: beer being ſcarce. Bears are frequently driven to this iſland with the large flakes of ice from Greenland; but they are deſtroyed by the inhabitants; ſo that the only wild beaſts to be ſeen in the iſland are brown and white foxes. The horſes are ſmall, but ſtrong and mettleſome; and thoſe that are broken for the ſaddle excepted, they lie in the open air through the year, and ſubſiſt in winter on the fodder which they can ſcrape from under the ice and ſnow. Sheep are numerous, ſo that a ſingle perſon poſſeſſes a flock of three, four, or five hundred. In winter they are driven to ſhelter at night, and alſo in very ſevere weather during the day. Their large caves afford convenient places of reſort. In winter the ſheep are occaſionally turned out, when the weather is fair and mild, to pick up what they can find under the ſnow; and if at ſuch times they are ſurprized by a great fall of ſnow, they form themſelves into a compact body, laying their heads together in the centre; and thus arranged they are covered with ſnow, and benumbed with cold, ſo as to be unable to extricate themſelves without the aſſiſtance of their owner. In this ſeaſon of hunger and diſtreſs, they have been ſometimes known to eat one another's wool. Goats in this iſland are few. Some of the Iceland oxen and cows have no horns; and in the ſouthern parts they are fed with fiſh bones, and the water in which the fiſh was boiled. Here are no hogs; few cats; but dogs are numerous. Poultry and tame foul are ſcarce, the feeding of them being dear; ſwans, wild geeſe, and ducks are plentiful; and among the latter we may mention the eider, the eggs and feathers of which are ſo much valued. Snipes, woodcocks, &c. are alſo found in this iſland. The birds of prey are the eagle, hawk, raven, and falcon, the latter being reckoned the beſt in Europe. The rivers, lakes, and bays, with the other parts of the ſea, ſupply the natives with various ſorts of fiſh in great abundance. The cod-fiſhery near Iceland begins at the point of Brederwick, and ends at that of Langerneſs, running by Cape North and the iſle of Grims, and has occupied more than 200 Dutch veſſels and about 80 French. The Icelanders are naturally robuſt and vigorous; but their ſtrength is ſoon exhauſted by the hardſhips they endure at ſea in their fiſheries; ſo that about the age of fifty years they are generally afflicted with diſorders of the breaſt and lungs, and few attain to advanced age. In the middle of the 14th century this iſland was greatly depopulated by a peſtilence called the “Black death,” and in 1784 a dreadful mortality carried off 19,488 horſes, 6800 beeves, 129,947 ſheep, if the account given by Catteau (vol. i.) be not exaggerated. The exports from Iceland are principally dried fiſh, ſalted mutton, beef, butter, train-oil, tallow, coarſe and fine jackets of wadmul, woollen ſtockings and gloves, red wool, ſheep-ſkins, fox-tails of various colours, feathers, and particularly eider-down, quills, falcons, and hawks. The imports to Iceland are chiefly iron, horſes' ſhoes, timber, meal, bread, brandy, wine, tobacco, coarſe linen, a few ſilken ſtuffs, and domeſtic utenſils. The firſt inhabitants of Iceland were a colony of Norwegians, who, to withdraw themſelves from the tyranny of Harold Harfagre, retired thither in the year 874. The government was an ariſtocratic republic for about 387 years, till in 1261 it ſubmitted to Norway. The preſent inhabitants, being of Norwegian extract, have few peculiar manners; but retain more of the ancient dreſs and cuſtoms of their anceſtors. The Icelandic language is the moſt ancient and venerable, and of courſe the pureſt dialect of the Gothic. It has engaged the attention of many profound ſcholars, who have conſidered it as the parent of the Norwegian, Daniſh, and Swediſh, and in a great degree of the Engliſh, though this laſt may probably be more connected with the Friſic, and other dialects of the north of Germany. In the ancient Icelandic the Lord's prayer is as follows:

"Fader uor ſom eſt i Himlum. Helgad warde thitt nama. Tilkomme thitt Rikie. Skie thin vilie ſo ſom i Himmalam ſo och po ordaunct. Wort dachlicka Brodh gif os i dagh. Ogh forlat os uora Skuldar ſo ſom ogh vi forlate them os Skildighe are. Ogh inled os ikkie i Freſtalſan. Utan frels os ifra ondo. Amen."

In Iceland, extraordinary as it may ſeem, letters flouriſhed in a very high degree from the 11th to the 14th century; and independent of the fabulous ſagas, which were very numerous, the ſolid and valuable works then produced in that iſland might fill a conſiderable catalogue. From Iceland we derived the "Edda" (which ſee), and our knowledge of the ancient Gothic mythology. From Iceland the Swedes, Norwegians, Danes, and Orcadians, drew their chief intelligence concerning their ancient hiſtory: Snorro in particular being ſtyled the Herodotus of the North: and the Landnama, or book of the origins of Iceland, is an unique work, diſplaying the names and property of all the original ſettlers, and the circumſtances attending the diſtribution of a barbaric colony. There ſtill exiſts in Iceland a bath, built by Snorro, in the 13th century; but the edifices being of timber, no remains of them exiſt.

In this iſland there are properly no towns; nevertheleſs the houſes of the Iceland company, ſuppreſſed on account of its commercial monopoly in 1759, at the twenty-two ports or harbours, of which there are three or four at each harbour, have been dignified with the appellation of towns; though they are only trading places. We have already ſaid that Iceland conſiſts of four quarters, ſeparated from one another by ridges of mountains. The north quarter conſtitutes the dioceſe of Holun, containing 140 churches. The other three quarters are included in the dioceſe of Skalholt, to which belong 163 churches. Theſe two biſhoprics are only valued at 150*l.* each. The religion of this iſland as well as of the Daniſh dominions to which it belongs, is the Lutheran. Iceland was converted to Chriſtianity at the ſame period with Norway, in the reign of Olaf I. There are two Latin ſchools maintained at the royal expence in Iceland. The winter ſeaſon in this iſland is unexpectedly moderate, ſo as generally to permit the natives to cut turf even in January. In this extenſive iſland there is not much room for agriculture; which has however greatly declined ſince the period of the republic, when treatiſes were written on this intereſting ſubject. N. lat. 63° 15′ to 67° 15′. W. long. 10° to 25°.

ICELAND, or *Iſland Cryſtal.* See CRYSTAL *of Iceland.*

ICELE, in *Mythology*, the ſon of Sleep, according to the fable, and brother of Morpheus, who is ſaid to have the power of changing himſelf into a variety of forms; "varias imitantia formas ſomnia, deluſæ mentis imago." Ovid. Met. lib. ii. c. 630.

ICENI, in *Ancient Geography*, a Britiſh people, who were ſituated to the north of the Trinobantes, and inhabited that country, which is now divided into the counties of Suffolk, Norfolk, Cambridge, and Huntingdon. This nation is called by ſeveral different names by the Greek and Roman writers, as Simeni by Ptolemy, Cenimagni by Cæſar, &c. They do not ſeem to have made any oppoſition to the Romans at their firſt invaſion under Cæſar, but made their ſubmiſſion at the ſame time with ſeveral of the neighbouring ſtates. (Cæſ. Bell. Gal. l. v. c. 14.) At the next invaſion in the reign of Claudius, the Iceni entered into a voluntary alliance with the Romans; but ſoon after, joining with ſome other Britiſh tribes in a revolt, they were defeated in a great battle by Oſtorius Scapula, the ſecond Roman governor of Britain, A. D. 50, and reduced to a ſtate of ſubjection. For ſome time after this they were treated with much favour and indulgence by the Romans, and even allowed to live under the immediate government of Praſutagus, their own native ſovereign. But after the death of that prince, the Iceni were ſo much enraged at ſome grievous inſults which were offered to his widow and daughters, by the luſt and avarice of certain powerful Romans, that they broke out into a ſecond revolt, much more violent than the firſt. In this revolt they were commanded by the celebrated Boadicea, the brave and injured widow of their late king; and being joined by ſeveral other Britiſh ſtates, they did many cruel injuries to the Romans and their allies. But being at length entirely defeated in battle, with prodigious ſlaughter, by Suetonius Paulinus, A.D. 61, they were reduced to a ſtate of total and final ſubjection to the Roman government; and the Romans took great pains to keep them in this ſtate of ſubjection, by building many ſtrong forts, ſtations, and towns in their country. (Tacit. Annal. l. xiv. c. 40, 41, 42.) The capital of the Iceni, which is called by the Roman writers Venta Icenorum, was ſituated at Caiſter, on the banks of the river Wintſar, about three miles from Norwich, where ſome veſtiges of its walls are ſtill diſcernible. Several of the Roman ſtations in the country of the Iceni are mentioned in the fifth Iter of Antoninus; as Villa Fauſtini, Iciani, Camboricum, Durolipons, and Durobrivæ; *i. e.* St. Edmundſbury, Ickborough, Cheſterford, Waltham, and Caiſter on the Nen. Some other places in the ſame country are mentioned in the ninth Iter, as Venta Icenorum, Sitomagus, and Combretonium, *i. e.* Caiſter, Wulpit, and Stretford. Two places on the ſea-coaſt are mentioned in the Notitia Imperii, Branodunum and Garononum, *i. e.* Brancaſter and Yarmouth, in which ſtrong garriſons were kept by the Romans to protect the country from the depredations of the Saxon pirates. The territories of the Iceni made a part of the Roman province Britannia Prima. Henry's Hiſt. vol. i.

ICESIA, an iſland of the Mediterranean, in the Sicilian ſea. Ptolemy.

ICH-DIEN, the motto of the arms of the prince of Wales, ſignifying in High Dutch, *I ſerve.*

Sir Henry Spelman judges it to be Saxon, *Ic thien;* the Saxon *d*, with a tranſverſe ſtroke, being the ſame with *th*; and ſignifying, *I ſerve*, or *am a ſervant*, as the miniſters of the Saxon kings were called *thiens* or *thanes*. See CROWNS *of Britiſh Princes.*

ICHNÆ, in *Ancient Geography*, a town of Greece, in Macedonia, placed by Pliny on the ſea-coaſt near the Axius.—Alſo, a town of Aſia, in Meſopotomia, on the banks of the river Billicha, N.W. of Nicephorium. This town took part with the Romans when Craſſus was defeated by the Parthians.

ICHNEUMON, in *Zoology*, the trivial or ſpecific name of a kind of weeſel that inhabits Egypt, eſpecially on the banks of the Nile, and which is conſidered particularly uſeful in diminiſhing the number of that formidable creature the crocodile, by inſinuating itſelf into the banks of the rivers or the ſands, and deſtroying the eggs; ſo that it was not without reaſon that it was ranked by the Egyptians in the claſs of their deities. It is a fierce and very crafty animal, about the ſize of the cat, and is diſtinguiſhed from the reſt of the *viverra* tribe by having the great toes remote, and the tail, which is thickeſt at the baſe, tapering gradually to the tip, which is tufted. The ichneumon is a great enemy to ſerpents, lizards, reptiles, inſects, and other noxious animals, and is ſometimes tamed by the Egyptians, and kept in their houſes to deſtroy mice. The people call it Pharaoh's rat, and the peaſants frequently bring it young to market.

According to Sonnini, neither the name ichneumon, nor that of Pharaoh's rat, is now known in Egypt. The Arabic name of the ichneumon is "Nems:" and, without doubt, it was one of the ſacred animals of ancient Egypt. Particular care was taken of it while alive, and honours were paid to it after its death: funds were ſet apart for its ſupport; it was fed, like cats, with bread ſoaked in milk, or with the fiſh of the Nile cut in pieces; and it was every where forbidden to kill it. With great diſpoſitions to familiarity, ſays Sonnini, the ichneumon is not now domeſtic in Egypt. The inhabitants do not now rear them in their houſes, nor do they even remember their having been ſo brought up by their progenitors. This writer diſputes the natural antipathy to crocodiles, attributed to the ichneumon. If ſome ichneumons, he ſays, have been ſeen flying with fury at the little crocodiles that have been offered them, it muſt have been the effect of their appetite for all ſorts of reptiles, and not, as many perſons have ſuppoſed, that of a particular enmity, or of a law of nature, which ſpecially directed them to ſtop the multiplication of this amphibious ſpecies. It would at leaſt, continues this writer, have been as reaſonable to ſuppoſe, that nature created the ichneumon on purpoſe to prevent the too great propagation of poultry, which, in fact, they deſtroy in much greater proportion than they do crocodiles. Beſides, in more than half the northern part of Egypt, that is, in the part comprehended between the Mediterranean ſea and the town of Siout, they are very common, although there are here no crocodiles; while they are more ſcarce in Upper Egypt, where crocodiles are very numerous. The ichneumon is no where more multiplied than in Lower Egypt, which being better cultivated, more inhabited, more moiſt, and more ſhady, affords alſo a more abundant ſupply of prey and food; and yet crocodiles are there never ſeen. The antipathy to the crocodile, erroneouſly aſcribed to the ichneumon, belongs to a ſpecies of tortoiſe of the Nile, who, as ſoon as the young crocodiles are hatched, and reach the river, attacks and devours them. This ſpecies of tortoiſe is only to be found in the upper parts of the Nile, to which crocodiles are confined. This tortoiſe is the "therſæ" of the Egyptians and Nubians, and, as Sonnini conceives, has a much better title than the ichneumon to the god of the ancient Egyptians, and the wonder of writers. Sonn. Trav. in Egypt. See Viverra.

M. Sonnini mentions a beautiful ſpecies of ichneumon-fly, with a long and ſtrong weapon at the extremity of the body, which ſometimes enters the houſes in Egypt; and which ſhines with the moſt lively colours: its head is of a beautiful emerald-green; the corſelet and belly are of a gliſtening purple hue.

Ichneumon, in *Entomology*, a genus of the hymenopterous order. See Wasp-ichneumon *Fly*.

ICHNOGRAPHY, in *Perſpective*, the view of any thing cut off by a plane parallel to the horizon, juſt at the baſe or bottom of it.

The word is derived from the Greek ιχνος, *veſtigium*, *footſtep*, and γραφω, *ſcribo*, *I deſcribe*, as being a deſcription of the footſteps or traces of a work.

Ichnography is the ſame with what is otherwiſe called the *plan*, *geometrical plan*, or *ground plot*, of any thing, and is oppoſed to orthography or elevation. See alſo Scenography and Stereography.

Ichnography, in *Architecture*, is a tranſverſe ſection of a building, exhibiting the circumference of the whole edifice, and of the ſeveral rooms and apartments in the given ſtory; together with the thickneſs of the walls and partitions; the dimenſions of the doors, windows, and chimneys; the projectures of the columns and piers, with every thing viſible in ſuch a ſection.

The drawing or deſigning of this is properly the work of the maſter-architect, or ſurveyor; it being, indeed, the moſt difficult of any.

Ichnography, in *Fortification*, denotes the plan or repreſentation of the length and breadth of a fortreſs; the diſtinct parts of which are marked out, either on the ground itſelf, or upon paper.

ICHOGLANS, the grand ſeignior's pages, ſerving in the ſeraglio.

The word, according to ſome authors, is compoſed of the Turkiſh words, *ich*, or *itch*, which ſignifies *within*, and *oglan*, *page*; in which ſenſe ichoglan is a page ſerving withinſide the palace, or ſeraglio. Others derive it from the barbarous Greek ιγκολας, or ιγκολος; which was formed from the Latin *incola*. Theſe two etymologies give nearly the ſame ſenſe to ichoglan, taking *incola* for *domus incola*.

Theſe are the children of Chriſtians, and bred up in an auſterity ſcarcely to be conceived. The ſultan prefers them to offices more or leſs conſiderable, as they appear more or leſs capable, and devoted to his ſervice; but it is to be obſerved, they are incapable of offices till forty years of age, unleſs they have ſome particular diſpenſation from the grand ſeignior. They are educated with a great deal of care in the ſeraglios of Perſia, Adrianople, and Conſtantinople. They are under the direction of a capi aga, who preſides over their exerciſes, and treats them with great ſeverity. They are divided into four odas, or chambers, where, according to their ſeveral talents or inclinations, they are inſtructed either in the languages, religion, or exerciſes of the body.

ICHOR, Ιχωρ, ſignifying any *humour* or *humidity*, properly denotes a thin, watery humour, like ſerum; but is ſometimes alſo uſed for a thicker kind, flowing from ulcers; called alſo ſanies.

Ichor, in *Surgery*, ſignifies a thin, bloody, acrid diſcharge, which frequently takes place from unhealthy ſores and wounds.

ICHTHYITES, in *Natural Hiſtory*, is the name by which Dr. Grew denominated ſeveral fiſh-moulds, or impreſſions of fiſh preſerved in the collection at Greſham college. "Raritics," p. 256.

ICHTHYOCOLLA, Ιχθυοκολλα, formed of ιχθυς, *fiſh*, and κολλα, *glue*, popularly called *iſinglaſs*, or *fiſh-glue*, is a ſolid glutinous ſubſtance, prepared from a fiſh of the ſturgeon kind, caught in the rivers of Ruſſia and Hungary. The beluga affords the beſt; but the ſounds of all freſh-water fiſh yield, more or leſs, fine iſinglaſs; particularly the ſmaller ſorts, found in prodigious quantities in the Caſpian ſea, and ſeveral hundred miles beyond Aſtracan, in the Wolga, Yaik, Don, and even as far as Siberia. It is alſo well known, that our lakes and rivers in North America are ſtocked with immenſe quantities of fiſh, ſaid to be of the ſame ſpecies with thoſe in Muſcovy, and yielding the fineſt iſinglaſs. The production of iſinglaſs requires no artificial heat, neither is the matter diſſolved for this purpoſe, as it has been generally imagined: for, as the continuity of its fibres would be deſtroyed by ſolution, the maſs would become brittle in drying, and ſnap ſhort aſunder, which is always the caſe with glue, but never with iſinglaſs. The latter, indeed, may be reſolved into glue with boiling water, but its fibrous recompoſition would be found impracticable afterwards, and a fibrous texture is one of the moſt diſtinguiſhing characteriſtics of genuine iſinglaſs. Iſinglaſs is nothing more than certain membranous parts of fiſhes, diveſted of their native mucoſity, rolled and twiſted into different forms, and dried in the open air. The ſounds or air-bladders of freſh-water fiſh, in general, are preferred for this purpoſe; as being the moſt tranſparent, delicate, flexible ſubſtances. Theſe conſtitute the fineſt ſorts of iſinglaſs; thoſe called book and ordinary ſtaple are made of the inteſtines, and probably the peritonæum, of the fiſh. The ſounds, which yield the finer iſinglaſs, conſiſt of parallel fibres, and are eaſily rent longitudinally: but the ordinary ſorts are found compoſed of double membranes, whoſe fibres croſs each other obliquely, reſembling the coats of a bladder. Iſinglaſs receives its different ſhapes in the following manner: the parts of which it is compoſed, particularly the ſounds, are taken from the fiſh while ſweet and freſh, ſlit open, waſhed from their ſlimy ſordes, diveſted of every thin membrane which envelopes the ſound, and then expoſed to ſtiffen a little in the air. In this ſtate they are formed into rolls about the thickneſs of a finger, and in length according to the intended ſize of the ſtaple; a thin membrane is generally ſelected for the centre of the roll, round which the reſt are folded alternately, and about half an inch of each extremity of the roll is turned inwards. Having thus ſettled the proper dimenſions, the two ends of what is called the ſhort ſtaple are pinned together with a ſmall wooden peg; the middle of the roll is then preſſed a little downwards, which gives it the reſemblance of a heart, and thus it is laid on boards, or hung up in the air to dry. The ſounds, which compoſe the long ſtaple, are larger than the former; but the operator lengthens this ſort at pleaſure, by interfolding the ends of one or more pieces of the ſound with each other. The extremities are faſtened with a peg like the former; but the middle part of the roll is bent more conſiderably downwards; and, in order to preſerve the ſhape of the three obtuſe angles thus formed, a piece of round ſtick is faſtened in each angle with ſmall wooden pegs, in the ſame manner as the ends. In this ſtate it is permitted to dry long enough, to retain its form, when the pegs and ſticks are taken out, and the drying completed. Laſtly, the pieces of iſinglaſs are joined together in rows, by running pack-thread through the peg-holes, for the convenience of package and exportation.

The membranes of the book ſort being thick and refractory, will not admit the ſame formation; and, therefore, the pieces, after their ſides are folded inwardly, are bent in the centre, in ſuch manner, that the oppoſite ſides reſemble the cover of a book, whence its name; a peg, run acroſs the middle, faſtens the ſides together, and thus it is dried like the former. The cake iſinglaſs is formed of the bits and fragments of the ſtaple ſorts, put into a flat metalline pan, with a very little water, and heated juſt enough to make the parts cohere like a pan-cake when it is dried: but this is of little value. Iſinglaſs is beſt made in the ſummer, as froſt gives it a diſagreeable colour, deprives it of its weight, and impairs its gelatinous principle.

The ſounds of cod and ling bear a general likeneſs to thoſe of the ſturgeon kind of Linnæus, and are uſed for the ſame purpoſe. The Newfoundland and Iceland fiſhermen ſplit open the fiſh as ſoon as taken, and throw the back-bones, with the ſounds annexed, in a heap; but previouſly to putrefaction, the ſounds are cut out, waſhed from their ſlime, and ſalted for uſe. In cutting out the ſounds, the parts between the ribs are left behind, which are much the beſt; the Iceland fiſhermen are ſo ſenſible of this, that they beat the bones upon a block with a thick ſtick, till the *pockets*, as they term them, come out eaſily, and thus preſerve the ſound entire. If the ſounds have been cured with ſalt, that muſt be diſſolved by ſteeping them in water, before they are prepared for iſinglaſs. The freſh ſound muſt then be laid on a block of wood, whoſe ſurface is a little elliptical, to the end of which a ſmall hair bruſh is nailed, and with a ſaw-knife the membranes on each ſide of the ſound muſt be ſcraped off. The knife is rubbed upon the bruſh occaſionally, to clear its teeth; the pockets are cut open with ſciſſors, and perfectly cleanſed of the mucous matter with a coarſe cloth; the ſounds are afterwards waſhed a few minutes in lime-water, in order to abſorb their oily principle; and laſtly, in clear water. They are then laid upon nets to dry in the air; but, if intended to reſemble foreign iſinglaſs, the ſounds of cod will only admit of that called book; but thoſe of ling of both ſhapes. The thicker the ſounds are, the better the iſinglaſs, excepting its colour; but that is immaterial to the brewer, who is its chief conſumer. See Mr. Jackſon's Account of the Diſcovery of the Manufacture of Iſinglaſs, in Phil. Tranſ. vol. lxiii. part i. p. 1, &c.

Ichthyocolla, or iſinglaſs, is one of the pureſt and fineſt of the animal glues, of no particular ſmell or taſte. Beaten into threads, it diſſolves pretty readily in boiling water or milk, and forms a gelatinous ſubſtance, which yields a mild nutriment, and proves uſeful, medicinally, in ſome diſorders ariſing from a ſharpneſs and colliquation of the humours. A ſolution of it in water, curiouſly ſpread, whilſt hot, upon ſilk, affords an elegant ſticking-plaſter for ſlight injuries of the ſkin, not eaſily ſeparable from the part by water, and ſcarcely inferior to the more compounded one ſold under the name of the ladies black ſticking-plaiſter, in which different balſams and reſins are joined to the ichthyocolla. See EMPLASTRUM *adhæſivum*. Lewis's Mat. Med.

Iſinglaſs is uſed in miniature painting, in the ſame manner as the gum Arabic or Senegal, for rendering water a proper vehicle, by giving it a due viſcidity for ſpreading and binding the pigments of an earthy texture. But the greateſt quantities of it are conſumed by brewers, wine-coopers, &c. for fining their liquors. See FINING.

A ſize may be made of iſinglaſs, by boiling half an ounce of the beaten iſinglaſs in a pint and half of water, till the whole be diſſolved, and then ſtraining the hot fluid through a linen rag. The ſize may be reduced by taking half the above quantity, and adding to it an equal meaſure of hot water.

A very valuable glue is to be made of this drug. See GLUE.

It is valuable, in that it will keep alſo, and is a very proper form to keep iſinglaſs in, for readineſs for the wine-cooper's uſe; beſides this it ſerves alſo very elegantly for the taking off the impreſſions of medals, coins, &c. See MEDAL.

ICHTHYOCOLLA *Piſcis*, in *Ichthyology*, the name of a large fiſh, of the ſturgeon or acipenſer kind; from which, as alſo from the *huſo Germanorum*, the drug called iſinglaſs or ichthyocolla is made. It is a fiſh of very great ſize, and is cartilaginous, having no bones or ſcales; its head is large and thick, and its mouth ſtands very forward; the upper jaw has four fleſhy apophyſes hanging from it; its eyes are ſmall; its fleſh is very well taſted, but glutinous; it is of a yellowiſh colour, and its tail is large and forked. See BELLUGA-*ſtone*.

ICHTHYODONTES, in *Natural Hiſtory*, is a name by which ſome authors deſcribe the gloſſapetra, or foſſil teeth of fiſh.

ICHTHYOLITE, Ichthyolithus, in *Natural Hiſtory*, a name given to the foſſil remains of fiſhes, and alſo to the impreſſions of theſe animals or their ſkeletons in ſtone. Some authors, however, have applied that term to ſuch ſpecimens only as exhibit the fiſh itſelf, either petrified or in the ſtate of a mummy; while the name of *Typolites* has been propoſed for ſuch ſtony ſubſtances as exhibit the mere impreſſion of thoſe animals. The number of ſpecies of which the foſſil remains have been deſcribed by naturaliſts is comparatively ſmall; nor can this be a matter of ſurpriſe if we conſider the extreme tenderneſs of the ſubſtance, and the corruptible nature of moſt fiſhes, together with the many circumſtances unfavourable to petrifaction under which they are generally found after their death. Even thoſe few that, by being accidentally enveloped in mud and ſoft clayey ſediment at the bottom of the water, are preſerved from paſſing into immediate diſſolution, or from becoming the food of the inhabitants of the waters, generally leave but faint traces of their original form. Sometimes, however, we ſee their external appearance completely preſerved, as in thoſe of Veſtena in the Veroneſe territory, and thoſe in the bituminous marle-ſlate of Oeningen; or they appear as ſolitary mummies, incloſed as it were in a coffin of a grey marle, in which ſtate the Arctic trout (*Salmo arcticus*) is frequently ſeen, particularly at Zuckertop, on the weſt coaſt of Greenland.

Where petrified fiſhes or their impreſſions occur in conſiderable number, we may always be certain that they periſhed by ſome ſudden revolution or cataſtrophe, by which they were overwhelmed in ſhoals on the very ſpots whoſe geological hiſtory they now contribute to elucidate. The moſt extenſive depoſitary of foſſil remains of fiſhes is that of

Monte Bolca, or rather of *Veſtena Nova*, in the Veroneſe territory. Veſtena Nova is a diſtrict ſeparated from Monte Bolca by the river Scaranto Majore, which receives the rivulets that deſcend from the mountains on both its ſides. Within the boundaries of this place, one thouſand paces from the village Bolca, and about 242 paces lower than the ſummit of the mountain of that name, we find the fiſh-quarry called *Laſtrara*, being a hill whoſe height above the level of the ſea is about 38 French toiſes. The rock which predominates almoſt in the whole of the diſtricts of Bolca and Veſtena, is baſalt, both maſſive and priſmatic. The three places in which the latter appears particularly characteriſtic are the Valle dei Stanghellini, mount San G. Ilarione, and the upper part of Monte Bolca, called La Purga di Bolca. The baſaltic columns are in general perpendicular to the axis of the mountain; but thoſe of San Giovanni Ilarione are rather inclined to the horizontal line, and appear to have been forced out of their original poſition. Beſides baſalt there occur other rocks in theſe mountains that have the appearance of being volcanic productions; ſuch as an aſh-grey conglomerate, red cellular ſtones like ſcoriæ, and a violet coloured indurated earth, not unlike the puzzolana of true volcanoes. Some of theſe maſſes are full of nodules of fibrous zeolite and calcareous ſpar; others contain fragments of feld ſpar and quartz, while ſtill others exhibit an uniform ſolid maſs without any imbedded ſubſtances. Only the firſt mentioned of theſe rocks have the appearance of productions of volcanoes; the others obviouſly belong to the porphyritic formation, and ſome of the laſt mentioned are hornſtone. But of all the rocks juſt noticed, none are to be ſeen in the immediate neighbourhood of the immenſe quarries where the fiſhes are found. Theſe conſiſt chiefly of a more or leſs fiſſil marle diſpoſed in layers which, obſerving exactly the ſame ſucceſſion in the different adjoining hills, appear to prove that theſe formerly conſtituted a continued ridge. One of the hills conſiſts principally of a whitiſh, porous, friable tuff, reſembling common cement; it is made up of particles of lime and ſand, containing a vaſt number of foſſil ſhells, particularly of *Murex aluco* and *Turbo uriſcalpium*, natives of the Mediterranean, and here converted into a white marble; alſo of *Turbo ungulinus*, *variegatus*, and *terebra* of Linnæus. In ſome places the tuff becomes much harder; it paſſes into a kind of common limeſtone, and is found to contain mummulariæ, and lids of ſhells belonging to the above ſpecies.

The *Laſtrara*, or hill where the fiſhes are found in abundance, has for its uppermoſt ſtratum a kind of mould mixed with the detritus of baſalt and other rocks. The interior conſiſts of two diſtinct kinds of ſtrata; the one called *Zengio* is a hard marle-like limeſtone, traverſed by veins of calcareous ſpar: it is not diviſible into thin layers, and ſeldom contains any petrifactions. The other ſtrata, called *Laſtra*, conſiſt of a ſchiſtoſe marle, diviſible into very thin layers, giving out a fœtid odour when rubbed. The colour of this maſs is whitiſh, yellowiſh, or blueiſh-grey. It varies with regard to hardneſs, but is in general eaſily ſcraped by the knife. In this alone the remains of fiſhes are found, which are ſometimes ſeen accompanied by parts of maritime algæ; at other times the ſea-weeds occur ſeparate.

The fiſhes in queſtion are moſtly ſea-fiſh, but there are alſo ſome of freſh water found among them. The originals of many, if we can truſt the naturaliſts that appear to have examined them with great care, live now in regions moſt remote from each other; among them are the natives of Europe, the Indian ocean, Africa, and North and South America. The remains of the fiſhes thus imbedded are all of a dark-brown colour, and therefore appear very diſtinctly on the light ground of the ſtone; they lie flat among the laminæ, their profile and their ſeveral parts, little, if at all, diſtorted from their natural ſhape and dimenſions, except that in ſome caſes the ſtone incloſing them ſeems to have ſuffered ſome little diſturbance after their incloſure, by which they are found at times ſomewhat fractured, and the parts a little disjoined. Their whole form is well defined, but the harder parts, ſuch as the head, fins, ſpine, with the bones that branch from it on either ſide, and indeed all the bones in general, as well as in ſome the ſcales, are remarkably well expreſſed. The dark-brown matter compoſing theſe fiſhes remains diſtinct, and may be picked off from the ſtone; it projects in proportion to the thickneſs of each part in its natural ſtate; it is hard, brittle, and rather gloſſy through its ſubſtance, except in ſome of the groſſer bones, ſuch as the joints of the vertebræ, which, though of this appearance externally, are found, when broken, to conſiſt internally of laminar calcareous ſpar. On cleaving the matrix the forms are found equally announced on each of the oppoſite ſides, the prominences on one ſide being exactly anſwered by correſponding hollows on the other.

We cannot be too careful in determining the ſpecies of the prototypes of foſſil remains; in caſes, therefore, where difficulties ariſe with regard to their diagnoſis, it is much more adviſable to abſtain from pronouncing with confidence than to miſlead the geologiſt by inaccurate determination. This is more particularly the caſe with foſſil fiſhes; and it is owing to the difficulties which attend their diagnoſis, that the opinions of different naturaliſts reſpecting the ſpecies, or even the genus to which ſpecimens are to be referred, have been often ſo very contradictory. Upon the whole it may be ſaid, that thoſe of the Veroneſe territory are determined with greater care and exactneſs: and it is much to be wiſhed that the authors of the "Ittiolitologia Veroneſe," which contains the deſcriptions and figures of no more than ſixteen ſpecies, all of them preſerved in the Bozza collection, might have been encouraged to proceed with this highly ſplendid and inſtructive work. The juſt mentioned ſixteen ſpecies are, 1. The ſhark (*Squalus carcharias*, Linn.). It has all the characters of this ſpecies, but its length is only 26 inches. 2. The winged chætodon (*Chætodon pinnatus*, Linn.) firſt deſcribed and figured by Scheuchzer, under the name of "Piſcis foſſilis elegans," and conjectured by him to be the Braſilian Guaperu deſcribed by Marcgraf. 3. The trumpet fiſh (*Fiſtularia chinenſis*, Linn.). 4. The ſea-needle (*Eſox Braſilienſis*), conſidered by Bloch as a variety of E. belone. 5. The ſwimming ſea-horſe (*Pegaſus natans*, Linn.), unique, in the Bozza collection. 6. *Uranoſcopus raſtrum.* It was firſt conſidered by Bozza as the unicorn fiſh (*Baliſtes monoceros*) of Cateſby: but a more cloſe examination renders it highly probable that it is an unknown or loſt ſpecies of ſtar-gazer, to which, on account of the long ſerrated dorſal fin, the above ſpecific name has been given. 7. The bat chætodon (*Chætodon veſpertilio*, Bloch.). 8. The *Portavela*, a fiſh not before deſcribed, belonging to the order jugulares of Linnæus, and in all probability to the genus *Kurtus*, eſtabliſhed by Bloch. It is here called *Kurtus velifer;* it approaches very near to Acarauna of Willughby, and the Spitſneus of Ruyſch. 9. The arc fiſh (*Chætodon arcuatus*, Bloch), unique in Bozza's cabinet. 10. *Tetrodon Honckenii*, Bloch; a ſmall ſpecies, which, in imperfect ſpecimens, has formerly been miſtaken by ſome for the impreſſion of elliptic leaves, by others for tad-poles. Only a few ſpecimens have been found in the Veroneſe hills. The biſhop of Wincheſter is mentioned in the "Ittiolitologia," as having acquired at Verona a much larger and better preſerved ſpecimen than the one figured in that work. It is not found in the common grey-coloured layers of Bolca, but in the brown and aſh-grey variety of marle-ſlate of that hill. 11. The globe-fiſh (*Tetrodon hiſpidus*, Linn.). The foſſil remains of very ſmall ſpecimens of this fiſh are found only in the whitiſh and yellow coloured layers of marle-ſlate in the Laſtrara. 12. A ſpecies of ray, denominated *Raja muricata* by Marcgraf, which name is here retained. The Portugueſe, on account of its ſhape reſembling that of a muſical inſtrument, call it *Viola:* neither Linnæus nor Bloch make mention of it; there can, however, be no doubt that it belonged to that tribe of rays which inhabit the Arabian ſeas, and is comprehended by Forſkoal under the name of *Raja ſephen.* 13. *Chætodon meſoleucus.* The prototype likewiſe deſcribed by Forſkoal as a native of the Arabian ſea, to which locality Bloch has added that of Japan; but Gmelin, conſidering both as diſtinct, calls that of Forſkoal *Ch. meſoleucus*, diſtinguiſhing the Japaneſe fiſh by the ſpecific name of *meſomelas.* 14. The argus (*Chætodon argus*, Linn.). Fortis has erroneouſly deſcribed this ichthyolite under the name of *Chætodon faber.* 15. *Gobius barbatus*, a new ſpecies, approaching the G. *ocellatus* of Brouſſonet, under which name this foſſil fiſh has been before erroneouſly deſcribed by Bozza. 16. *Gobius Veronenſis.* This has been conſidered by Fortis and Bozza as the G. *ſtrigatus* of Brouſſonet: poſterior obſervations have, however, proved it to be diſtinct from the laſt mentioned ſpecies.

To the ſpecies juſt enumerated, we ſubjoin the following ſyſtematic liſt of Bolca ichthyolites, in the famous collection of Signor Vincenzo Bozza, which, in 1791, was united with that of the marquis Gazola, and is now preſerved in the Muſeum of Natural Hiſtory of Paris: but whether they are as well determined as thoſe in the "Ittiolitologia Veroneſe" appear to be, remains to be aſcertained by thoſe who have made ichthyology the principal object of their reſearches.

1. *Fiſhes of European ſeas.*—The Rondeletian eel (*Muræna myrus*, Linn.): the Roman muræna (*Muræna Helena*, L.): *M. ſerpens: M. cæca:* the bearded eel (*Ophidium barbatum*, L.): the coal-fiſh (*Gadus carbonarius*, L.): the green gadus (G. *virens*, L.): the hake (G. *merluccius*, L.): the Mediterranean gadus (G. *Mediterraneus*, L.): the butterfly fiſh (*Blennius ocellaris*, L.): the areolated blenny (*Blennius lumpenus*, L.): the porcine ſcorpæna (*Scorpæna porcus*, L.): *Scorpæna ſcorpius*, Will.: the rufous ſcorpæna (S. *ſcrofa*, L.): *Scorpæna Salviani*, Will.: the common dory (*Zeus faber*, L.): the dab (*Pleuronectes limanda*, L.): the gilthead (*Sparus aurata*, L.): the ſargy (*Sparus ſargus*, L.): the pagre ſparus (*Sp. pagrus*, L.): the maroon ſparus (*Sp. chromis*, L.): the varying labrus (*Labrus turdus*, L.): *Scomber colias*, Will.: the common mackarel (*Scomber ſcomber*, L.): the bonito (*Scomber pelamis*, L.): the tunny (*Scomber thynnus*, L.): the cuckow gurnard (*Trigla cuculus*, L.): the ſea-pike (*Eſox ſphyræna*, L.): the herring (*Clupea harengus*, L.): the common angler (*Lophius piſcatorius*): the ſting ray, (*Raja paſtinaca*, L.)

2. *Of the Indian ſeas.*—The Indian dragonet (*Calyonymus indicus*, L.): the ciliated dory? (*Zeus ciliaris?* Bloch): *Zeus triurus* cui valde affinis Z. faber, L.: the ſtriped chætodon (*Chætodon ſtriatus*, L.): *Chætodon macro-lepidotus*, L.: *Chætodon*, Seba Muſ. 3. t. 26. f. 23. *Chæt. caneſcens*, L. *Chæt. lineatus*, L.: *Chæt. fuſcus*, Seba 3. t. 26. f. 22. *Sparus argenteus*, Seba 3. t. 27. f. 13. *Labrus*, Seba 3. t. 31. f. 5, 6. *Perca*, Seba 3. t. 23. f. 3, 4. *Eſox Amboinenſis*, Ruyſch Amb. t. 14. f. 2. 5. *North American ſeas.*—The toad gadus (*Gadus tau*) Will. t. N. f. 3.): *Chætodon chirurgus*, L.: the Carolina ſtickleback (*Gaſteroſteus Carolinus*, L.): the Canada ſtickleback (G. *Canadus*, L.): *Perca venenoſa*, L.: *Perca trifurca*, L.: the tobacco-pipe fiſh (*Fiſtularia tabacaria*, L.): *Eſox*, Cateſb. t. 1. f. 1. *Elops ſaurus*, L.: the oceanic flying fiſh (*Exocætus evolans*, L.)

The above deſcribed place, where theſe remarkable petrifactions are found in ſuch abundance, has become the ſubject of much ſpeculation with the naturaliſts of modern times. Arduino was one of the firſt writers who produced ſome very ingenious conjectures, to prove the volcanic origin of that hilly diſtrict; and his theory was afterwards ſupported by Ferber, Fortis, Strange, Dolomieu, Patrin, and others; the leading feature of whoſe ſyſtem, with regard to the preſervation of the fiſhes and other marine productions, was the ſuppoſition that the whole tract where they are found, anciently conſtituting the bottom of the ſea, was raiſed by the action of ſubterraneous fire. Notwithſtanding the plauſible reaſons that have been given by thoſe naturaliſts in favour of the volcanic origin of the Bolca fiſhes, there are ſeveral very reſpectable writers, and among them the author of the "Ittiolitologia Veroneſe," who, after a minute examination into the nature of thoſe hills, and the circumſtances under which the foſſil remains occur in them, have not heſitated to pronounce them of Neptunian origin. Their obſervations lead them to ſuppoſe, that the diſtrict of Veſtena and Bolca is the reſult of a widely extended deluge, which collected the fiſhes, ſhells, and plants of diſtant parts of the globe into one common ſea; and that ſucceſſive partial inundations, together with the occaſional ignition of the inflammable ſubſtances previouſly depoſited, produced the volcanic appearance of the maſſes of rocks above thoſe ſtrata which contain the remains of fiſhes, and which are totally deſtitute of the characteriſtics of volcanic productions.

The ideas which Mr. Graydon has offered on this ſubject, in the Tranſactions of the Royal Iriſh Academy are, in ſubſtance, as follows. The very perfect preſervation of the living form obſervable in the ſpecimens from Veſtena and Bolca, appears to prove that the fiſhes could not have been long dead, before they were enveloped by the calcareous marle, which muſt have been ſuſpended in the water, and, on ſubſiding, have caught and encloſed the fiſh which probably derived their death from this very cauſe. The bodies of theſe animals did not undergo any ſimultaneous putrefaction, but their oily and other ſoft parts were abſorbed by the encloſing maſs. This ſtony ſubſtance being for the greateſt part calcareous, Mr. Graydon ſuppoſes that a vaſt body of it, previouſly calcined or reduced into quick lime by the agency of ſubterraneous fire, again paſſed into the ſtate of ſlacked lime, as ſoon as it came into contact with the waters, from which ſubſiding it gradually and ſucceſſively concreted at the bottom, and aſſumed the ſtructure of a ſchiſtoſe maſs, which becoming afterwards impregnated with the oily parts of the fiſh, acquired the fœtid ſmell which it is ſtill found to emit on being ſcraped with a harder ſubſtance. It is highly probable to the ſame author, that theſe maſſes, in their original poſition, muſt have formed part of a continued and horizontal ſtratum of very conſiderable extent, of which the quarries of Bolca are evidently to be conſidered as no more than portions or fragments, now completely disjoined from all connection with their native bed. This ſeparation muſt have happened after the conſolidation of the original ſtratum; for it could not have taken place in the yet ſoft and yielding ſubſtance, without producing a conſiderable diſturbance both in the laminar ſtructure of the maſs, and in the forms of the fiſhes. It would therefore ſeem, that, at ſome ſubſequent period, the whole of the ſtratum was violently broken up, and immenſe fragments of it heaved from their natural ſituation, and diſperſed here and there as in the inſtance before us. The author conſiders the eruptive force of ſubterraneous fire fully adequate to producing theſe effects, though he allowed, that it muſt have operated in the preſent caſe with a force much exceeding whatever has been experienced in the known hiſtory of volcanoes.

In whatever manner we explain the phenomenon of the Bolca fiſhes, it will always be found extremely difficult to account for the collection, in one ſpot, of ſo many fiſhes from various parts of the globe moſt remote from each other, and among them ſome which live in freſh water. Indeed, this difficulty appears ſo great, that we are almoſt inclined to ſuſpect the accuracy of the obſervations made to aſcertain the originals of theſe foſſil fiſhes, and that many of them ſhould be conſidered rather as approaching to, than as being the ſame with, the ſpecies to which they are referred by authors.

We ſubjoin, from Patrin's account, what relates to the ichthyolites of the gypſum quarries of Aix, in Provence, which are not leſs remarkable than thoſe of Veſtena and of Oeningen. The ſtrata that are open to view in deſcending by 110 ſteps, into the interior of the mountain at Aix, are ſeven in number: 1. A kind of marle-ſlate, called *argile feuilletée* by the miners: it is of a browniſh-yellow colour, and when immerſed in water, ſeparates into very delicate layers. 2. The white ſtone (*pierre blanche*), a chalk like marle, which, when diſſolved in acids, leaves a conſiderable quantity of a browniſh-grey clay. 3. Hard clay (*argile dure*). 4. The black ſtone (*pierre noire*), a variety of marle-ſlate, perfectly like that of N° 1, but full of rhomboidal ſelenite cryſtals. 5. The ſtratum containing the impreſſions of fiſhes; it is a ſchiſtoſe rock of a yellowiſh-grey colour, ſoft, rather ſoiling, diviſible into thin layers, and giving out a ſlightly bituminous ſmell when ſcratched. 6. Bed of gypſum; and 7. A ſtratum of what is called by the quarriers *pierre froide*, a ſubſtance which much reſembles that of N° 3; both are of a greyiſh-white colour, have a nearly conchoidal fracture, adhere but little to the tongue, and feel cold; they both diſſolve with efferveſcence, but leave a great proportion of clay. Lower down the ſame ſucceſſion of ſtrata is continued, but no impreſſions of fiſhes are found in any of them. The fiſhes buried in the ſtratum, below the gypſum, are, according to Darluc, the red ſurmullet (*Mullus barbatus*, L.); the lunated gilt head (*Sparus aurata*, L.); ſea-wolves; the whiting (*Gadus merlangus*, L.); a gurnard (*trigla*), which reſembles, but ſtill appears to be diſtinct from, the *Trigla cataphracta*, a native of the Mediterranean, on the coaſt of Provence. All theſe fiſhes lie flat on their ſides, as a proof that they periſhed on the very ſpot they now occupy. Patrin is of opinion that theſe fiſhes have been ſuffocated by the ſulphureous vapours which, by their combination with lime, have formed the upper ſtratum of gypſum; that, however, at the time when ſimilar emanations formed the older ſtrata of gypſum, the waters of the ocean ſtill covered the high land which encompaſſed this tract, ſo that the fiſhes were enabled to eſcape, and that none were ſuffocated but at a period when, by the diminution of the ſea, this ſame tract of country was become ſurrounded by coaſts that checked the flight of the fiſhes.

A great number of impreſſions of fiſhes are found in the quarries of Oeningen on the right bank of the Rhine. The ſtrata obſerved there below the vegetable mould, which is white and clayey, are, 1. A ſtratum, only one inch thick, of friable and fine-grained ſand-ſtone, compoſed of tranſparent ſharp-edged grains of quartz, cemented by a mixture of clay and lime. 2. A layer of a compact clay, four inches in thickneſs, efferveſcing with acids. 3. A layer, twenty-ſix inches thick, of a ſlaty clay mixed with lime, and ſome bitumen. 4. A layer of one foot in thickneſs, of a yellowiſh-grey calcareous ſchiſtus, intermixed with minute layers of clay, of a dark-grey colour, and containing a ſmall portion of bitumen. 5. A bed, eight feet thick, compoſed of clay ſlate, diviſible into fine laminæ, and alternating with ſoft clay, which has no ſlaty ſtructure. 6. The ſlaty rock which contains the impreſſions of fiſhes, and which is called *bonne pierre* by the quarriers. It is compoſed of ſtrata, which together form a thickneſs of twelve feet, and each of them is ſeparated from the upper and lower by ſome earth, impregnated with bitumen. It is eaſily diviſible into laminæ, on which are diſcovered the impreſſions of the fiſh. This ſlaty ſtone is pretty ſoft, although it is as ſonorous as a brick: it adheres to the tongue, and when diſſolved in acids, leaves a conſiderable proportion of clay. Beneath theſe layers, of 12 feet in thickneſs, there are four inches of a ſimilar ſlaty maſs, which, however, contains no impreſſions. Dr. Lavater poſſeſſed a rich collection of ichthyolites of Oeningen, among which he has recognized the following ſpecies: the leſſer lamprey (*Petromyzon fluviatilis*); the common eel (*Muræna anguilla*); the bull-head (*Cottus gobio*); the brill (*Pleuronectus rhombus*); the ſcad (*Scomber trachurus*); the mailed gurnard (*Trigla cataphracta*); the lucerna-gurnard (T. *lucerna*); the thorny leach (*Cobitis tænia*); the leach (C. *barbatula*); the trout (*Salmo fario*); the pike (*Eſox lucius*); the herring (*Clupæa harengus*); the ſhad (C. *aloſa*); the bream (*Cyprinus brama*); the minnow (C. *phaxinus*); the dobule (C. *dobula*); the crucian (C. *caraſſius*); the bordeliere (C. *blica*); the dotted carp (C. *bipunctatus*); the bitterling (C. *amarus*); *Cyprinus liſella*; the round-tailed chub (C. *cephalus*); the loach (C. *rutilus*); griſlæan carp (C. *griſlagine*); the bleak (C. *alburnus*); the dace (C. *leuciſcus*); the tench (C. *tinea*); the naſe (C. *naſus*); the common carp (C. *carpio*); the gudgeon (C. *gobio*).

The Heſſian ichthyolites, particularly thoſe found at Riegelſdorf, in bituminous marle-ſlate, are more particularly remarkable on account of the diſtorted forms exhibited by the fiſhes, with whoſe impreſſions it abounds. This circumſtance, and the great quantity of copper found in that rock, have induced a belief that the death of theſe fiſhes was occaſioned by a ſudden impregnation of the waters with a cupreous ſolution. It is worth obſerving that the more the impreſſions of fiſh abound in any particular part of the ſtrata of marle-ſlate, the richer theſe are found to be in copper ores. Mr. Rieſs has given an account of the ſucceſſion of the fletz ſtrata at Riegelſdorf, which are the following: N° 1. Ferruginous clayey mould, from one to two fathoms. N° 2. Greyiſh-white limeſtone from 6–8 fathoms. N° 3. Blue clay, with imbedded fragments of ſelenite cryſtals; 8—10 fathoms. N° 4. Blueiſh limeſtone, called *Rauch-wacke*; 8—9 fathoms. N° 5. Grey compact gypſum, traverſed by ferruginous loam; 7—8 fathoms. N° 6. Black and grey ſtinkſtone; 1—1½ fathom. N° 7. Sand, ſometimes looſe, ſometimes cemented; 1—1½ fathom. N° 8. A kind of limeſtone called *Zech-ſtein*, of a greyiſh-brown colour, and ſoft above towards the ſand, but blacker and more compact below; 3¼—3½ fathoms. N° 9. A black ſlaty ſtratum, containing pyrites, and forming the roof of the bituminous marle-ſlate; 18–20 inches. N° 10. Black cupiferous bituminous marle-ſlate; 3—8 inches: this is the principal depoſitary of the ichthyolites. N° 11. Gneiſs-like greyiſh-white rock, conſiſting of ſmall rounded quartz pebbles, and ſometimes of fragments of jaſper and mica, cemented by indurated clay; 6—18 fathoms. N° 12. Old red ſandſtone, or the dead rock, being the fundamental rock of theſe fletz ſtrata. From the above it appears that the greater part of the impreſſions of fiſhes, plants, and other ſubjects (among which Mr. Rieſs ſuppoſed to have found the ſkeleton of the hand of a child, but which Blumenbach conſidered as having belonged to a ſpecies of ape), are found in the depth of upwards of forty fathoms. Moſt of the fiſhes occurring there are carps, trouts, pikes, and other ſpecies ſimilar to them, which are now and then accompanied by fiſhes ſuppoſed to be marine. In general the impreſſions are not indiſcriminately mixed, as is the caſe in other places where ichthyolites occur, but each ſpecies is found in diſtinct ſhoals.

The opinion which Mr. Patrin, a celebrated volcaniſt, entertains reſpecting the origin of thoſe vaſt depoſitories of the foſſil remains of fiſhes, ſhould not be left unnoticed in this place. According to him, all circumſtances appear to prove that theſe fiſhes lived in bays and gulfs, at the entrance of which volcanoes were ſituated either in the points that formed the mouth, or in ſome iſland, ſimilar to the volcanic iſland of Iſchia, at the entrance of the gulf of Naples. Under ſuch circumſtances, the ſulphureous and other deleterious vapours which were diſengaged from the ſubmarine baſes of the volcano, at the time of an eruption, muſt have ſuffocated the fiſhes in the gulf, which were prevented from eſcaping through its entrance where thoſe vapours were moſt abundant. The dead bodies of theſe fiſhes, therefore, floated on the ſurface of the water in the gulf, till, enveloped by thoſe ſhowers of aſhes, ſo abundant at the beginning and termination of the eruptions, their ſpecific gravity became greater than that of the water, and they ſunk to the bottom, where they were ultimately buried under a ſtratum formed by the aſhes or other ſubſtances ejected from the volcanoes. In caſes where the gulf had but little depth, at the ſame time that the volcanic ejections were abundant, the fiſhes were enveloped at once, and formed but a ſingle bed, ſuch as may be ſeen in ſome places where ichthyolites occur. Under other circumſtances the eruptions may be ſuppoſed to have been repeated for ſeveral times, in which caſe ſeveral beds containing bodies of fiſhes were depoſited in ſucceſſion, and ſeparated from each other by layers deſtitute of ſuch remains, but nevertheleſs owing their origin to the ſame eruption that cauſed the death of the fiſhes contained in the others.

Theſe events, Mr. Patrin continues, could take place only at a period when the continents were already ſufficiently raiſed or emerged to give exiſtence to gulfs and bays, whoſe ſides, elevated above the ſurface of the water, ſerved as a barrier to the fiſhes; ſince it is evident that theſe, had the preſent ſhores been ſtill covered by the ſea, would have eſcaped in all directions from the effects of the ſuffocating vapours. This hypotheſis, the ſame author thinks, is ſupported by the following circumſtances: 1. It is only in a few places that we find beds filled with foſſil fiſhes; and the appearance of ſuch places beſpeaks the former exiſtence of volcanoes in them. 2. The bodies of theſe fiſhes are in perfect preſervation, diſpoſed with great regularity, often even united in tribes; which proves their having been ſuddenly deſtroyed and buried under the ſtratum which now covers them. 3. They are not unfrequently ſeen in variouſly contorted ſhapes; as a proof that their death was attended with convulſive motions. 4. Theſe foſſil remains of fiſhes are found only in ſtrata of very recent origin; whereas, had they been preſerved under ordinary circumſtances, like ſhells and zoophytes, they would be found in a variety of localities, and in ſtrata of much leſs recent formation than thoſe in which they now occur.

ICHTHYOLOGISTS, authors who have written concerning fiſhes. The authors who have left us treatiſes on this ſubject are very numerous; and are ranged by Artedi into their ſeveral proper claſſes, with great care and candour.

The ſyſtematical ichthyologiſts are Ariſtotle, Pliny, Iſidore, Albertus Magnus, Gaza, the interpreter of Ariſtotle, Marſchall, Wootton, Bellonius, Rondeletius, Salvian, Geſner, Aldrovand, Johnſton, Charlton, Willughby, Ray, Artedi, and Linnæus.

The ichthyologiſts who have written of the fiſhes only of ſome particular places, are theſe: Ovid, of the fiſhes of the Euxine; Oppian, of thoſe of the Adriatic; Auſonius, of thoſe of the Moſelle; Mangolt, of thoſe of the Podamic lake; Paulus Jovius, of thoſe of the Tyrrhene ſea; Bened.

Jovius, of thoſe of the lake Larius; Petrus Gillius, of thoſe of the Maſſilian ſea; Figulus, of thoſe of the Moſelle; Salvian, of thoſe of the Tyrrhene ſea; Schwenkfeldt, of thoſe of Sileſia; Schonefeldt, of thoſe of Hamburgh; Margrave, of the Braſilian fiſhes; Ruyſel, of thoſe of Amboyna; and Francis Valentine, of thoſe of the ſame place. Of theſe authors, Ovid, Auſonius, Oppian, and Bened. Jovius, wrote in verſe, the reſt in proſe.

The ichthyologiſts, who have copied all they have written from the works of other writers, and therefore leaſt deſerve the name, are the following: Pliny, Ælian, Athæneus, Iſidore, the author of the "Libri De Natura Rerum," Albertus Magnus, Johannes Cuba, Marſchall, Geſner in great part, Aldrovand in great part, Johnſton, Charlton, and perhaps ſome others.

In regard to method, ſome have written of fiſhes without any method at all; ſome have treated of them in the alphabetical order of their names, and ſome have followed a method more or leſs perfect throughout their works.

Thoſe ichthyologiſts who have attended to no method at all, are Ovid, Ælian, Athæneus, Auſonius, Hildegarde, De Pinguia, Paulus, and Bened. Jovius, Figulus, Salvian in his "Hiſtory of the Roman Fiſhes," and Ruyſch.

Thoſe who have written alphabetically, are Cuba, Marſchall, Salvian in his "Tabula Piſcatoria," Geſner, Schonefeldt, Johnſton.

Among the authors who have uſed ſome ſort of method, thoſe come firſt who have treated of fiſhes according to the places where they are uſually caught. Of theſe are Oppian, Rondeletius, Aldrovand, Johnſton, and Charlton.

Thoſe who have treated of fiſhes, according to the general diviſion of them into cetaceous, ſpinoſe, and cartilaginous, are Ariſtotle, who was author of the method, Wootton, Willughby, Ray; the laſt two authors have added to this the numbering the rays of the fins on the back, which is one ſtep towards the Artedian method.

The principal and beſt authors in this ſtudy, and who have reformed and amended it, are Ariſtotle, Bellonius, Rondeletius, Salvian, Geſner, Willughby, and Ray. To theſe are to be added ſuch as have deſcribed only new or particular fiſhes, who have merited greatly of the world by the new lights they have thrown in upon this part of natural hiſtory. Theſe are Paulus Jovius, Petrus Gillius, Schonefeldt, Sibbald, Marſigli, Hebenſtreit, and our countryman Mark Cateſby: all the reſt, except Pliny, Athæneus, Aldrovand, and Johnſton, are of no uſe or value. Willughby is allowed by Artedi to be by far the beſt author on the ſubject; but the world will now give that character to Artedi himſelf. Artedi, De Script. Ichthyol.

ICHTHYOLOGY, in *Natural Hiſtory*, the ſcience of fiſhes. See PISCES.

ICHTHYOMANTIA, Ιχθυομαντεια, in *Antiquity*, a ſpecies of divination by means of the entrails of fiſhes.

ICHTHYOMORPHUS, in *Natural Hiſtory*, is the name which Aldrovandus gave to the flattened foſſil fiſh, found at Iſleb in Germany. Similar foſſils are found at Oſterode in Brunſwick, near Eiſlebe, in Mansfield county, and other places in Germany. Jones's Phyſ. Diſq. p. 410.

ICHTHYOPHAGI, Ιχθυοφαγοι, compounded of ιχθυς, *fiſh*, and φαγειν, *to eat, fiſh-eaters*, a name given to a people, or rather to ſeveral different people, who lived wholly on fiſh.

The Ichthyophagi, ſpoken of by Ptolemy, are placed towards China. Agatharchides calls all the inhabitants between Carmania and Gedroſia by the name of Ichthyophagi. Pauſanias places them near the Red ſea, and Pliny peoples ſeveral iſles with them to the eaſt of Arabia Felix.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears, indeed, that they had cattle, but that they made no uſe of them, excepting, as they ſay, to feed their fiſh. They made their houſes of large fiſh-bones, the ribs of whales ſerving them for their beams. The jaws of theſe animals ſerved them for doors; and the mortars wherein they pounded their fiſh, and baked it in the ſun, were nothing elſe but their vertebræ.

ICHTHYOPHTHALMITE; *Zeolite of Helleſta*, Rinmann; *Ichthyophthalme*, d'Andrada; *Fiſchaugen-ſtein*, Wern.; *Apophyllite*, Haüy.

A rare mineral ſubſtance, which, on account of one of its chemical characters, has been conſidered as zeolite by ſome mineralogiſts; while one of its external characters, *viz.* the pearly luſtre, has induced others to claſs it with adulariafeldſpar. A cloſer examination has proved this mineral to conſtitute a diſtinct ſpecies.

D'Andrada has given the above appellation to this mineral, on account of its exhibiting a ſimilar reflection to that of the adularia or moon-ſtone, ſometimes called *œil de poiſſon*, of which the German *fiſchaugen-ſtein* is a tranſlation. Haüy's name is derived from the property this ſubſtance has of exfoliating under certain circumſtances.

The colour of the ichthyophthalmite is white, generally ſlightly tinged with red, grey, and blue, ſeldom with yellow and green.

It occurs maſſive and cryſtallized. The primitive form of its cryſtals is, according to Haüy, a four-ſided priſm with rectangular baſe. The ſimpleſt of the ſecondary forms is the primitive parallelopipedon, with its eight ſolid angles intercepted each by a triangular plane; the *Apophyllite épointé* of Haüy.

Another, but very complicated, variety of 48 planes, determined from an incomplete cryſtal of only ten remaining planes, is characterized and figured, (Journ. des Min. vol. 23, 5. f. 3, 4.) by Haüy, who calls it *Apophyllite ſurcompoſé*.

None of the modifications of the cryſtals have hitherto been found in a complete ſtate; moſt frequently they occur as thick tables, grown together in all directions, or interſecting each other, and reſembling at firſt ſight a variety of tabular barytes. They are ſplendent, and generally exhibit more or leſs the luſtre of mother-of-pearl; in the manner of a variety of ſtilbite.

The fracture, parallel to two of the planes of the primitive parallelopipedon, is foliated, with ſplendent often irideſcent ſurface; croſs-fracture uneven with vitreous luſtre.

In ſmall fragments it is generally perfectly tranſparent, but often rendered tranſlucid only, and even nearly opaque, by a cloudy or milky ſuffuſion. Refraction ſimple.

It is eaſily frangible. Its hardneſs is nearly that of fluor ſpar. A ſmall fragment, when rubbed on a hard body, according to Haüy, ſeparates into thin leaves; this property is, however, not obſervable in all ſpecimens.

Its ſpecific gravity, according to Vauquelin and Fourcroy, is 2.467.

Before the blow-pipe the ichthyophthalmite becomes at firſt opaque, and melts, without difficulty, into a very white opaque globule. With nitric or muriatic acid it becomes ſoftened, and forms a jelly, like zeolite. This property appears to be owing to the preſence of water, which facilitates the action of the acids on thoſe conſtituent parts of the ſubſtance with which they can unite.

Analyſes of the Ichthyophthalmite.

	Rinmann.	Fourcroy and Vauquelin.	Roſe.
Silica	55.00	51.00	55.00
Lime	27.00	28.00	25.00
Magneſia	0.50		
Potaſſa		4.00	2.25
Alumine	2.50		
Water	17.00	17.00	15.00
Loſs			2.75
	102.00	100.00	100.00

This ſubſtance, therefore, differs eſſentially from zeolite, in not containing the leaſt portion of alumine; the variety from Helleſta has, indeed, afforded a ſmall quantity to Mr. Rinmann, but this appears to be accidental. A ſmall quantity of oxyd of iron found in this ſubſtance may likewiſe be conſidered as accidental.

This mineral is found in the iron-mines of Uto, in Sudermania, a province of Sweden.

ICHTHYOSIS, in *Medicine*, *fiſh-ſkin diſeaſe*, from ἰχθὺς, *a fiſh*, a denomination appropriately uſed by Dr. Willan to deſignate "a permanently harſh, dry, ſcaly, and in ſome caſes, almoſt horny texture of the integuments of the body, unconnected with internal diſorder," bearing a conſiderable reſemblance to the ſkin of the ſcaly fiſhes.

This rare ſpecies of cutaneous diſeaſe conſtitutes the fourth genus of the ſecond Order, (or *ſcaly* eruptions,) in Dr. Willan's arrangement, and is diſtinguiſhed from the other eruptions, included in the ſame Order, the *Lepra* and *Pſoriaſis*, in being generally diffuſed over the limb affected, and in the permanency of its ſcales; for in the other ſcaly eruptions alluded to, the diffuſion is partial, or in diſtinct patches, and the ſcales are deciduous. See LEPROSY and PSORIASIS.

The arrangement and diſtribution of the ſcales in ichthyoſis are, indeed, peculiar. Above and below the *olecranon* on the arm, and in a ſimilar ſituation with reſpect to the *patella* on the thigh and leg, they are ſmall, rounded, prominent, or papillary, and of a black colour. Some of the ſcaly *papillæ* have a ſhort narrow neck, and broad irregular tops. On ſome parts of the extremities, and on the trunk of the body, the ſcales are flat and large, often placed like tiling, or in the ſame order as ſcales on the back of a fiſh; but in a few caſes they have appeared ſeparate, being interſected by whitiſh furrows. There is uſually in this complaint a dryneſs and roughneſs of the ſoles of the feet; ſometimes a thickened and brittle ſtate of the ſkin in the palms of the hands, with large painful fiſſures, and on the face an appearance of ſcurf rather than of ſcales. The inner part of the wriſts, the hams, the inſide of the elbows, the furrow along the ſpine, the inner and upper parts of the thighs, are perhaps the only portions of the ſkin always exempt from ſcalineſs. Patients affected with ichthyoſis are occaſionally much haraſſed with inflamed puſtules, or with large painful biles on different parts of the body; it is alſo remarkable, that they never ſeem to have the leaſt perſpiration or moiſture of the ſkin.

The *cauſes* of ichthyoſis ſeem to be altogether unknown. The diſeaſe did not, in any caſe witneſſed by Dr. Willan, appear to have been tranſmitted hereditarily; nor was more than one child from the ſame parents affected with it. In ſeveral inſtances it was ſaid to have been connate, and in others to have occurred two or three months after birth; in one caſe it appeared ſoon after the ſmall-pox, at the age of two years, and had continued ſix or ſeven years, without alteration. A ſtate of ſkin, ſimilar to that in ichthyoſis, takes place partially under a variety of circumſtances. It occurs on the limbs of perſons who, from long continued ill health, or a weakly conſtitution, are much emaciated, and have little perſpiration. When inveterate ulcers on the lower extremities are at length healed, the common integuments are not replaced in their uſual order: inſtead of cuticle, the legs are covered with thick, dry, ſhining ſcales, variouſly diſpoſed. In caſes of anaſarca, likewiſe, the ſkin becomes ſcaly, rigid, and inelaſtic. This rugged coating prevents for a time any farther enlargement of the limbs; but the effuſed lymph, by its gradually increaſing preſſure, at laſt overcomes the reſiſtance, and is diſcharged through innumerable crevices.

According to Buffon, the inhabitants of Paraguay are much affected with the ichthyoſis, or a complaint much reſembling it. "Il regne parmi eux une maladie extraordinaire; c'eſt une eſpèce de lèpre qui leur couvre tout le corps, et y forme une croute ſemblable à des écailles de poiſſon; cette incommodité ne leur cauſe aucune douleur, ni même aucun autre derangement dans la ſanté." (Hiſt. Naturelle, tom. iii. p. 507.) Some obſervations on a diſeaſed ſtate of the ſkin, analogous to the ichthyoſis above deſcribed, appear in the Philoſophical Tranſactions, vol. xiv. N° 160; and a ſtriking inſtance of the ſame, though ſomewhat differently modified, is inſerted in the ſame collection, N° 424, the ſequel of which is given in vol. xlix. (part i. for the year 1755.) See alſo a caſe ſlightly detailed by Panarolus (Pentecoſte, v. obſ. 9.), and another related by Stalpart Vander Wiel, obſ. 35. cent. ii.

With reſpect to the cure, little more ſeems to be known than of the cauſes of this eruption. Dr. Willan merely obſerves, that, when a portion of the hard ſcaly coating is removed, it is not ſoon produced again. The eaſieſt mode, he ſays, of removing the ſcales, is to pick them off carefully, with the nails, from any part of the body while it is immerſed in hot water. The layer of cuticle, which remains after this operation, is harſh and dry; and the ſkin did not, in the caſes attended by him, recover its uſual texture and ſoftneſs; but the ſcales were prevented from forming afterwards, by the repeated uſe of the warm bath, along with moderate friction.

The diſeaſe above deſcribed is the *Ichthyoſis ſimplex* in Dr. Willan's nomenclature; but he deſcribes another ſpecies, which he terms *I. cornea*. This, which he has never ſeen, is mentioned by authors as "a horny rigidity of the integuments, impeding the motion of the muſcles and joints;" and as affecting the lips, prepuce, toes, fingers, &c.; and ſometimes as extended over the whole body. A ſingular caſe of the latter deſcription is recorded in the Philoſ. Tranſ. vol. xlviii. part ii. p. 580. This form of ichthyoſis, Dr. Willan remarks, is ſometimes attended with the production of *horns;* a proof that thoſe ſingular excreſcences may be cutaneous, or perhaps cuticular, and generated in nearly the ſame manner as the nails from the human body, or the hoofs and claws of quadrupeds. An account of a girl, whoſe body was nearly covered with horny excreſcences, is given in the Phil. Tranſ. N° 176. And a horn, ſimilar to thoſe here deſcribed, together with a portrait of the woman on whom it grew, is preſerved in the Britiſh Muſeum. See Willan on Cutan. Diſ. order ii. p. 197, et ſeq.

ICHTHYOSPENDYLA, in *Natural Hiſtory*, is the name by which Mr. Lhuyd denominates the vertebræ, or joints of the back bones of fiſhes. Lithophyl. tab. 18.

ICHTHYPERIA, the name given by Dr. Hill to the bony palates of fiſhes, which are frequently found foſſil at great depths in the earth, and uſually immerſed in the ſtrata of ſtone; and in this ſtate had been named by Mr. Lhuyd, from their reſemblance in ſhape to the pods of lupines, and ſome of the other leguminous plants, *ſiliquaſtra*.

Many from this name, and this caſual reſemblance to the pods of plants, have been miſled into the believing them foſſils of vegetable origin. But they have plainly all of them been the bony coverings of different parts of the mouths of certain fiſh of the cartilaginous, and perhaps other kinds, whoſe principal food being ſhell-fiſh, theſe bony palates were neceſſary to the eating of them. Many of the ichthyperia are found indeed plainly worn and rounded by uſe.

They are ſometimes found in their foſſil ſtate joined to one another; but commonly in ſingle pieces or joints, or in fragments of ſuch. They are of the ſame ſubſtance with the bufonitæ, and their ſhape depends on the ſpecies of fiſh, or part of the mouth, to which they belonged. But their moſt uſual figure is that of half the ſhell of the pod of a lupine. Their ſizes are various, from the tenth of an inch to two inches in length, and an inch in breadth. Their ſurface is ſometimes ſmooth and poliſhed; ſometimes finely ſtriated or ſinuated, and ſometimes wholly covered with tubercles. They are alſo found of very different colours; but moſt frequently either black, or of a dark cheſnut colour.

They are found lodged and bedded in the ſtrata of ſtone, in Germany, Italy, and France, and in the iſlands of the Archipelago, and in Syria among the ſpines of the echini; but they are nowhere ſo frequent as in England, there being with us very few quarries of ſtone which do not afford more or leſs of them. Hill's Hiſt. of Foſſils, p. 645.

ICHTHYS, Ιχθυς, in *Antiquity*, a famous acroſtic of the Erythræan ſibyl, mentioned by Euſebius and St. Auſtin; the firſt words of every verſe of which made up Ιησους Χριςὸς Θεȣ̃ υἱὸς σωτηρ, *Jeſus Chriſtus Dei filius, ſervator*, the initial letters of which compoſe the word ichthys, ιχθυς.

ICHTHYS, in *Ancient Geography*, a promontory of the Peloponneſus. Ptolemy.

ICICA, in *Botany*, Aublet. Guian. t. 130—135. See AMYRIS.

ICICA, in the *Materia Medica*, a name given by ſome to the gum elemi.

ICICARIBA, in *Botany*, a name uſed by ſome authors for the tree which affords us the gum elemi, uſed in medicine.

ICOCA, the name of a genus of plants, deſcribed by Plumier; ſince called by Linnæus *chryſobalanus*.

ICOLM-KILL, in *Geography*. See IONA.

ICON, in *Natural Hiſtory*, ſignifies a figure, cut, or engraving, of any ſubject in natural hiſtory.

ICON, Εικων, in *Rhetoric*, the ſame with image.

ICONIUM, in *Ancient Geography*, a town of Cappadocia, in the department of Lycaonia. In the time of Xenophon it belonged to Phrygia. This town ſtill ſubſiſts under the name of Konieh, or Cogni.

ICONOCLASTS, or ICONOCLASTÆ, formed from εικων, *image*, and κλαειν, *to break*, in *Eccleſiaſtical Hiſtory*, breakers of images; a name which the church of Rome gives to all who reject the uſe of images in religious matters.

In this ſenſe, not only the reformed, but ſome of the eaſtern churches, are called iconoclaſts, and are all eſteemed by them heretics, as oppoſing the worſhip of the images of God, and the ſaints, and breaking their figures and repreſentations in churches.

The oppoſition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century when the worſhip of them became common. (See IMAGE.) But the tumults occaſioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The diſpute, however, broke out with redoubled fury under Leo the Iſaurian, who iſſued an edict in the year 726, abrogating, as ſome ſay, the worſhip of images, and ordering all the images, except that of Chriſt's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worſhip. This edict occaſioned a civil war, which broke out in the iſlands of the Archipelago, and, by the ſuggeſtions of the prieſts and monks, ravaged a part of Aſia, and afterwards reached Italy. The civil commotions and inſurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his ſubjects, in the Italian provinces, violated their allegiance, and riſing in arms, either maſſacred or baniſhed all the emperor's deputies and officers. In conſequence of theſe proceedings, Leo aſſembled a council at Conſtantinople in 730, which degraded Germanus, the biſhop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of ſevere puniſhments upon ſuch as were attached to that idolatrous worſhip. Hence aroſe two factions; one of which adopted the adoration and worſhip of images, and on that account called iconoduli or iconolatræ; and the other maintained that ſuch worſhip was unlawful, and that nothing was more worthy the zeal of Chriſtians than to demoliſh and deſtroy thoſe ſtatues and pictures, which were the occaſions of this groſs idolatry; and hence they were diſtinguiſhed by the titles of *iconomachi*, from εικων, *image*, and μαχω, *I contend*, and *iconoclaſtæ*. The zeal of Gregory II. in favour of image-worſhip, was not only imitated, but even ſurpaſſed by his ſucceſſor Gregory III. in conſequence of which the Italian provinces were torn from the Grecian empire.

Conſtantine, called Copronymus, from κοπρος, *ſtercus*, and ονομα, *name*, becauſe he was ſaid to have defiled the ſacred font at his baptiſm, ſucceeded his father Leo in 741, and in 754 convened a council at Conſtantinople, regarded by the Greeks as the ſeventh œcumenical council, which ſolemnly condemned the worſhip and uſe of images. Thoſe who, notwithſtanding this decree of the council, raiſed commotions in the ſtate, were ſeverely puniſhed; and new laws were enacted, to ſet bounds to the violence of monaſtic rage. Leo IV. who was declared emperor in 775, purſued the ſame meaſures, and had recourſe to the coercive influence of penal laws, in order to extirpate idolatry out of the Chriſtian church. Irene, the wife of Leo, poiſoned her huſband in 780; aſſumed the reigns of empire during the minority of her ſon Conſtantine, and in 786 ſummoned a council at Nice in Bithynia, known by the name of the ſecond Nicene council, which abrogated the laws and decrees againſt the new idolatry, reſtored the worſhip of images and of the croſs, and denounced ſevere puniſhment againſt thoſe who maintained that God was the only object of religious adoration. In this conteſt, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they conſidered the worſhip of them as highly injurious and offenſive to the Supreme Being. Charlemagne diſtinguiſhed himſelf as a mediator in this controverſy: he ordered four books concerning images to be compoſed, refuting the reaſons urged by the Nicene biſhops to juſtify the worſhip of images, which he ſent to Adrian, the Roman pontiff, in 790, in order to engage him to withdraw his approbation of the decrees of the laſt council of Nice. Adrian wrote an anſwer; and in 794, a council of three hundred biſhops, aſſembled by Charlemagne at Francfort on the Maine, confirmed the opinion contained in the four books, and ſolemnly condemned the worſhip of images. In the Greek church, after the baniſhment of Irene, the controverſy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain ſucceſs. The emperor Nicephorus appears, upon the whole, to have been an enemy to this idolatrous worſhip. His ſucceſſor, Michael Curopalates, ſurnamed Rhangabe, patronized and encouraged it. But the ſcene changed on the acceſſion of Leo the Arminian to the empire; who aſſembled a council at Conſtantinople in 814, that aboliſhed the decrees of the Nicene council. His ſucceſſor Michael, ſurnamed Balbus, diſapproved the worſhip of images, and his ſon Theophilus treated them with great ſeverity. However, the empreſs Theodora, after his death, and during the minority of her ſon, aſſembled a council at Conſtantinople in 842, which reinſtated the decrees of the ſecond Nicene council, and encouraged image worſhip by a law. The council held at the ſame place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a feſtival was inſtituted by the ſuperſtitious Greeks, called the Feaſt of Orthodoxy. The Latins were generally of opinion, that images might be ſuffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtuous actions of the perſons whom they repreſented; but they deteſted all thoughts of paying them the leaſt marks of religious homage or adoration. The council of Paris, aſſembled in 824 by Lewis the Meek, reſolved to allow the uſe of images in the churches, but ſeverely prohibited rendering them religious worſhip. Nevertheleſs, towards the concluſion of this century, the Gallican clergy began to pay a kind of religious homage to the images of ſaints, and their example was followed by the Germans, and other nations. However, the iconoclaſts ſtill had their adherents among the Latins; the moſt eminent of whom was Claudius, biſhop of Turin, who, in 823, ordered all images, and even the croſs, to be caſt out of the churches, and committed to the flames; and he wrote a treatiſe, in which he declared both againſt the uſe and worſhip of them. He condemned relics, pilgrimages to the Holy Land, and all voyages to the tombs of ſaints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much leſs infected with ſuperſtition than the other parts of Europe. The controverſy concerning the ſanctity of images was again revived by Leo, biſhop of Chalcedon, in the eleventh century, on occaſion of the emperor Alexius's converting the figures of ſilver, that adorned the portals of the churches, into money, in order to ſupply the exigencies of the ſtate. The biſhop obſtinately maintained, that he had been guilty of ſacrilege; and publiſhed a treatiſe, in which he affirmed, that in theſe images there reſided an inherent ſanctity, and that the adoration of Chriſtians ought not to be confined to the perſons repreſented by theſe images, but extended to the images themſelves. The emperor aſſembled a council at Conſtantinople, which determined, that the images of Chriſt and of the ſaints were to be honoured only with a relative worſhip; and that invocation and worſhip were to be addreſſed to the ſaints only as the ſervants of Chriſt, and on account of their relation to him, as their maſter. Leo, diſſatisfied even with theſe abſurd and ſuperſtitious deciſions, was ſent into baniſhment. In the weſtern church, the worſhip of images was diſapproved and oppoſed by ſeveral conſiderable parties, as the Petrobruſſians, Albigenſes, Waldenſes, &c. till at length this idolatrous practice was entirely aboliſhed in many parts of the Chriſtian world by the Reformation. Moſheim's Eccl. Hiſt. vol. ii. See IMAGE.

ICONOGRAPHIA, Εικονογραφια, derived from εικων, *image*, and γραφω, *I deſcribe*, the deſcription of images, or ancient ſtatues of marble and copper; alſo of buſts and ſemi-buſts, penates, paintings in freſco, moſaic works, and ancient pieces of miniature.

ICONOLATRÆ, or ICONOLATERS, from εικων, and λατρευω, *I worſhip*; or *Iconoduli*, from εικων and δουλοω, *I ſerve*, thoſe who worſhip images; a name which the iconoclaſtes give to thoſe of the Romiſh communion on account of their adoring images, and of rendering to them the worſhip only due to God. See ICONOCLASTS, and IMAGE.

ICONOLOGIA, formed from εικων and λεγω, *I ſpeak*, the interpretation of ancient images, monuments, and emblems.

ICONOMACHI. See ICONOCLASTS.

ICOSAHEDRON, in *Geometry*, a regular body, or ſolid, terminated by twenty equilateral and equal angles.

The icoſahedron may be conſidered as conſiſting of twenty triangular pyramids, whoſe vertices meet in the centre of a ſphere, imagined to circumſcribe it; and, therefore, they all have their heights and baſes equal; wherefore the ſolidity of one of thoſe pyramids, multiplied by 20, the number of baſes, gives the ſolid content of the icoſahedron. See REGULAR *Body*.

ICOSANDRIA, in *Botany*, from εικοσι, *twenty*, and ανηρ, *a man*, is the 12th claſs of the artificial ſyſtem of Linnæus, diſtinguiſhed by having numerous ſtamens, about 20, or more, inſerted into the calyx, not into the receptacle. Such an inſertion is juſtly pointed out by Linnæus as an infallible mark that the pulpy fruit of the flowers ſo conſtructed may always be eaten in ſafety. This rule holds good, whatever the number of the ſtamens may be; as in the fifth claſs, where, amongſt many plants with poiſonous or unwholeſome berries, whoſe ſtamens are differently inſerted, is found the *Ribes*, or Currant and Gooſeberry, whoſe ſalutary fruit is indicated by the ſtamens growing out of the rim of the calyx, exactly as in the claſs *Icoſandria*. At the ſame time, the foliage or herbage of ſuch plants is always, more or leſs, to be miſtruſted, being acrid, nauſeous, or eminently dangerous; witneſs the *Prunus Lauro-ceraſus*, or Cherry-laurel, whoſe eſſential oil, and even its diſtilled water, is one of the moſt potent of vegetable poiſons. This dangerous quality reſides in the oil of a bitter-almond flavour, obſervable in moſt of this tribe, which is rendered leſs injurious perhaps in the kernels of peaches and apricots, by the mild oil of their cotyledons, and always taken by us in too ſmall a quantity to be materially hurtful. It is further remarkable, that as Icoſandrous plants, when dried, are peculiarly ſubject to the depredations of inſects, the ſame is the caſe with all the genus *Ribes*.

The orders of the *Icoſandria* are diſtinguiſhed by the number of their ſtyles. The firſt, *Monogynia*, contains the valuable genus *Prunus*, and its near ally *Amygdalus*, compoſed of ſome of our fineſt fruits; with *Myrtus*, &c. The *Digynia*, *Trigynia*, and *Pentagynia* of Linnæus are ſo nearly a-kin, and ſo inconſtant in the ſame genus, if not ſpecies, that it is found moſt commodious to unite them under the laſt denomination, as the number five moſt prevails. *Polygynia*, whoſe ſtyles are more than five, is a numerous and very natural order, containing *Roſa*, *Rubus*, *Fragaria*, *Potentilla*, &c. to which the *Sibbaldia* naturally belongs, though, having uſually but five ſtamens, it is placed in the claſs *Pentandria*.

Icosandria is alſo the name of an order in the claſſes *Polyadelphia*, *Monoecia*, and *Dioecia*, whoſe character ought chiefly to depend on the inſertion, rather than the preciſe number of its ſtamens. To this circumſtance Linnæus did not ſufficiently advert, when he referred *Citrus* to *Polyadelphia Icoſandria*, inſtead of the orders *Dodecandria* or *Polyandria* of that claſs, and on the other hand, excluded *Melaleuca*, which is truly icoſandrous, being of the natural family of *Myrti*. S.

ICOSIUM, Alger, in *Ancient Geography*, a town of Africa, on the eaſtern part of Mauritania Cæſarienſis. Ptolemy mentions it, and the Itinerary places it 47 miles E. of Tipaſa. Pliny ſays that Veſpaſian gave it the title of a Latin city.

ICTERUS, ἴκτερος, in *Medicine*, alſo *icteritia*, words from the Greek, ſignifying *Jaundice*, which ſee. Whence alſo the adjective *icteric*: thus we ſay *icteric* ſymptoms, *icteric* medicines; meaning the ſymptoms of jaundice; medicines proper for the cure of jaundice, &c.

Icterus, in *Ornithology*, a ſpecies of *Oriolus*, which ſee. For other ſpecies ſee the ſame article. See alſo Todus *paradiſæus*, Sturnus *contra*, and Muscicapa *paradiſi*.

Icterus *Lapis*, in *Natural Hiſtory*, a name given by the ancients to a ſtone famous for the cure of the jaundice. Pliny deſcribes four ſpecies of this ſtone. But theſe deſcriptions are ſo ſhort, that we cannot determine from them which of the ſtones of thoſe known at preſent were intended.

ICTIAR, in the *Eaſtern Military Orders*, an officer who has gone through all the degrees or poſts in his reſpective body; and has a right to be a member of the divan.

ICUS, in *Ancient Geography*, an iſland of the Archipelago, and one of the Cyclades, near Eubœa, over-againſt Magneſia.

ICY Cape, in *Geography*, a point of land on the N.W. coaſt of America, much incumbered with ice. N. lat. 70° 29'. W. long. 198° 20'.

IDA, in *Ancient Geography*, a common name of ſeveral mountains of conſiderable elevation, celebrated among the ancients. The name is derived from εἴδω, *I ſee*, and applied to them on account of the extenſive proſpect they afforded. The principal are the two following, *viz.* Ida, mentioned by Homer, and ſaid to be the mountain on which Paris decided the price of beauty between Juno, Minerva, and Venus. It was ſituated in Dardania, at ſome diſtance S.E. of Troy. Here were found the ſources of the rivers Simois, Xanthe, &c. This mountain, however, is in reality a chain of mountains, of which the principal part lay to the E. and near the ſcite of Troy. Thence it extended to the N.W., W., and S.W., as far as the ſea, projecting on four promontories, towards Cyzicum, Antandros, the gulf of Adramyttium, and the promontory of Lectum. Homer, therefore, ſpeaks of the Idæan mounts. This mountain in its whole extent is a great reſervoir of water, and ſupplied the rivers Æſopus and Granicus, which diſcharged themſelves into the Propontide; the Simois and Scamander, or Xanthus, which ran into the Helleſpont; and the Samoïes and Ciloe, which paſſed into the gulf of Adramyttium. The other Ida is a mountain of Crete, which ſtill retains the name, though it is ſometimes called Puloriti, and which has been much celebrated by the poets. It is much the higheſt mountain in the iſland, though in other reſpects inferior; it is for the greateſt part of the year covered with ſnow, and ſo barren that it produces nothing but the tragacanth. Jupiter is ſaid to have been ſecretly nurſed on this mountain, and on this account called Idæus.

Ida, in *Geography*, a mountain of the iſland of Crete, which riſes in the form of a pyramid S.W. of Candia, and ſerves as a land-mark to navigators, who wiſh to anchor in the harbour of that town. This mountain is covered with ſnow almoſt all the year.

IDAAN. See Maroot.

IDACIUS, in *Biography*, an ancient chronicler, was a native of Lamego, in Spain, and flouriſhed in the fifth century. He wrote a chronicle commencing with the firſt year of the reign of Theodoſius, and ending with the eleventh of that of Leo, A. D. 467. To him is attributed a table of Faſti Conſulares, frequently publiſhed. The Chronicle and Faſti were publiſhed with notes by father Sirmond, at Paris, in 1619.

IDÆI Dactyli, in *Ancient Geography*. See Dactyli.

IDANHA *a Velha*, in *Geography*, a town of Portugal, in the province of Beira, near the Spaniſh Eſtremadura. N. lat. 39° 50'. W. long. 6° 48'.

IDEA, Ἰδέα, the image or reſemblance of a thing, which, though not ſeen, is conceived by the mind. See Image.

The word is Greek; Cicero renders it into Latin by *exemplar*, and *exemplum*; and Plato himſelf, in ſome places by παράδειγμα. Cicero, in his Topics, alſo expreſſes it by *forma* and *ſpecies*.

Idea, in *Phyſiology*, denotes the immediate object of the mind about which we are employed, when we perceive or think of any thing; and this definition of Mr. Locke's is much leſs exceptionable than that of ſome other logicians, who define an idea to be a pattern or copy of a thing in the mind.

Thus, when we look at the ſun, we do not ſee that luminary itſelf, but its image, or appearance conveyed to the ſoul by the organ of ſight; and this image we call idea. See Impression and Perception.

The origin of ideas has been a long time diſputed among philoſophers. Ariſtotle and the Peripatetics maintained that external objects emit ſpecies, images, or forms, which reſemble them all around; and that theſe ſpecies, ſtriking on our ſenſes, are by them tranſmitted to the underſtanding and impreſſed upon it; and that being material and ſenſible, they are rendered intelligible by the active intellect; and are at length received by the paſſive. The followers of Democritus and Epicurus held an opinion, with regard to ſlender films of ſubtile matter coming from external objects, ſimilar to that of Ariſtotle with reſpect to his immaterial ſpecies or forms. Others are of opinion, that our ſouls have of themſelves the power of producing ideas of things we would think upon; and that they are excited to produce them by the impreſſions which objects make on the body, though theſe impreſſions are not images in any reſpect like the objects that occaſioned them. And in this, ſay they, it is, that man is made after the image of God, and that he partakes of his power; for as God made all things out of nothing, and can reduce them to nothing when he pleaſes, ſo man can create as many ideas as he pleaſes, and annihilate them when he has done.

Others maintain, that the mind has no occaſion for any thing beſide itſelf to perceive objects; and that, by conſidering itſelf, and its own perfections, it is able to diſcover all things that are without. Whilſt Ariſtotle thought that every object of human underſtanding enters at firſt by the ſenſes. Plato, on the other hand, had a very mean opinion of all the knowledge we acquire by the ſenſes. According to him all ſcience muſt be employed about theſe eternal and immutable ideas, which exiſted before the objects of ſenſe, and are not liable to any change. In this reſpect theſe two philoſophers eſſentially differed; the notion of eternal and immutable ideas, which Plato borrowed from the Pythagorean ſchool, was totally rejected by Ariſtotle, who maintained it as a maxim, that there is nothing in the intellect, which was not at firſt in the ſenſes. It ſeems, however, probable, that the Pythagoreans and Platoniſts agreed with the Peripatetics in their general theory of perception; *viz.* that the objects of ſenſe are perceived only by certain images, or ſhadows of them, let into the mind, as into a "camera obſcura." The notions of the ancients with regard to the ſeat of the ſoul were very various. But ſince it has been diſcovered by the improvements in anatomy, that the nerves are the inſtruments of perception, and of the ſenſations accompanying it, and that the nerves ultimately terminate in the brain, it has been the general opinion of philoſophers that the brain is the ſeat of the ſoul, and that the ſoul perceives the images that are brought there, and external things only by means of them. (See Soul.) Many philoſophers, ancient and modern, have employed their invention to diſcover, how we are made to perceive external objects by our ſenſes; and in their ſentiments on this ſubject there ſeems to be a very general agreement. Plato conceived, that by our ſenſes we perceived merely the ſhadows of things, and not things themſelves; and his ſhadows may very well repreſent the ſpecies and phantaſms of the Peripatetic ſchool, and the ideas and impreſſions of modern philoſophers. Since the time of Des Cartes, the ſhadows of external objects, called by the ancients ſpecies, forms, and phantaſms, have been commonly denominated "ideas," and by Mr. Hume "impreſſions." But all philoſophers, from Plato to Mr. Hume, agree in this, that we do not perceive external objects immediately, and that the immediate object of perception muſt be ſome image preſent to the mind.

The ideas by which we perceive external objects are ſaid by ſome to be the ideas of the Deity; whilſt it has been more generally thought that every man's ideas are proper to himſelf, and are either in his mind or in his "ſenſorium," where the mind is immediately preſent. The former is the theory of Malebranche. This theory ſeems to have ſome affinity with the Platonic notion of ideas, adopted with ſome modification by the philoſophers of the Alexandrian ſchool, commonly called the latter Platoniſts; but it is not the ſame. It does not appear that either Plato or the latter Platoniſts, or St. Auguſtine, or the Myſtics, who ſeem to have inclined to the tenets of the Alexandrian ſchool, thought that we perceive the objects of ſenſe in the divine ideas. The theory, therefore, is properly the invention of Malebranche himſelf. According to his ſtatement, the ſoul is united with a Being poſſeſſed of all perfection, who has in himſelf the ideas of all created beings. The Deity, then, being always preſent to our minds in a more intimate manner than any other being, may, upon occaſion of the impreſſions made upon our bodies, diſcover to us, as far as he thinks proper, and according to fixed laws, his own ideas of the object; and thus we ſee all things in God, or in the divine ideas. Malebranche, however, diſtinguiſhes more accurately than any philoſopher had done before, the objects which we perceive from the ſenſations in our own minds, which, by the laws of nature, always accompany the perception of the object. Although, he ſays, we ſee all ſenſible and material things in God, yet we have not our ſenſations in him when we perceive any ſenſible object; in our perception are included both a ſenſation and a pure idea. The ſenſation is a modification of the ſoul, and it is cauſed in us by God; but as to the idea, joined with ſenſation, it is in God, and it is in him that we ſee it. The ſyſtem of Malebranche, it is plain, leaves no evidence of the exiſtence of a material world, from what we perceive by our ſenſes; for the divine ideas, which are the objects immediately perceived, were the ſame before the world was created. He candidly admits this conſequence of his opinion; and reſts the complete evidence which we have of the exiſtence of matter upon the authority of revelation.

Mr. Norris, an Engliſh divine, eſpouſed the ſyſtem of Malebranche, in his "Eſſay towards the Theory of the Ideal or Intellectual World," publiſhed in two volumes 8vo., 1701. This ſyſtem was alſo adopted by many devout people of both ſexes in France. It was oppoſed by S'Graveſande in his "Introduction à la Philoſophie," and particularly examined and refuted by Mr. Locke in a ſmall tract which may be found in his "Poſthumous Works." See alſo Berkeley's Dialogues, 2d edit. p. 257, &c. But the moſt formidable antagoniſt of Malebranche was his own countryman, Antony Arnauld, an acute writer in favour of the Janſeniſts. (See his article.) In the year 1683 he publiſhed his book of "True and Falſe Ideas," in oppoſition to the ſyſtem of Malebranche. Arnauld maintains, that ideas are modifications of our minds; and finding no other modification of the human mind which can be called the idea of an external object, he ſays it is only another word for perception. Ideas, conſidered as certain repreſentative images, by which external objects are perceived exiſting either in the human or divine mind, are, according to Arnauld, mere chimeras, fictions of philoſophers; there are no ſuch beings in nature; and therefore, he ſays, it is to no purpoſe to inquire, whether they are in the divine or in the human mind. The only true and real ideas are our perceptions, which are acknowledged by all philoſophers, and by Malebranche himſelf, to be acts or modifications of our own minds. Arnauld, however, did not totally deny the exiſtence of ideas in the philoſophical ſenſe of that word, nor adopt the notion of the vulgar, who acknowledge no object of perception but the external object. He formally maintains, that the modes of expreſſion common among philoſophers, *viz.* "that we perceive not things immediately; that like ideas of them are the objects of our thoughts; and that it is in the idea of every thing that we perceive its properties," are not to be rejected, but are true when rightly underſtood. By endeavouring to reconcile theſe expreſſions to his own definition of ideas, he embarraſſed himſelf and his ſubject.

The common theory of ideas is in general, as we have already ſtated, that we perceive external objects by certain images which are in our minds, or in the ſenſorium to which the mind is immediately preſent. Theſe images have been variouſly denominated. Since the time of Des Cartes they have been called ideas. The Carteſians divided our ideas into three claſſes; thoſe of ſenſation, of imagination, and of pure intellection. Of the objects of ſenſation and imagination, they thought the images are in the brain, but of objects that are incorporeal, the images are in the underſtanding, or pure intellect. Mr. Locke, taking the term idea in the ſame ſenſe with Des Cartes, divides ideas into thoſe of ſenſation and thoſe of reflection; meaning, by the firſt, the ideas of all corporeal objects, whether perceived, remembered, or imagined; by the ſecond, the ideas of the powers and operations of our own minds. What Mr. Locke calls ideas, Mr. Hume divides into two diſtinct kinds, "impreſſions" and "ideas." The difference between theſe, he ſays, conſiſts in the degrees of force and livelineſs with which they ſtrike upon the mind. Under impreſſions he comprehends all our ſenſations, paſſions, and emotions, as they make their firſt appearance in the ſoul. By ideas he means the faint images of theſe in thinking and reaſoning. Dr. Hartley gives the ſame meaning to ideas as Mr. Hume does, and what Mr. Hume calls impreſſions he calls ſenſations, conceiving our ſenſations to be occaſioned by vibrations of the infiniteſimal particles of the brain, and ideas by miniature vibrations, or vibratuncles.

Des Cartes, who contributed to overturn the Peripatetic ſyſtem and the authority of Ariſtotle, took it for granted, as other philoſophers had done before him, that he did not perceive external objects themſelves, but certain images of them in his mind called ideas, and hence it is ſaid he was led to doubt the report of his ſenſes without collateral proof of their veracity. The impreſſions made upon our organs, nerves, and brain, could be nothing, according to his philoſophy, but various modifications of extenſion, figure, and motion. There could be nothing in the brain like ſound or colour, taſte or ſmell, heat or cold: theſe are ſenſations in the mind, which, by the laws of the union of ſoul and body, are raiſed on occaſion of certain traces in the brain; and although he gives the name of ideas to thoſe traces in the brain, he does not think it neceſſary they ſhould be perfectly like to the things which they repreſent, any more than that words or ſigns ſhould reſemble the things they ſignify. But he adds, that we may follow the received opinion as far as poſſible, and may allow a ſlight reſemblance. As to the place of thoſe ideas or images of external objects, which are the immediate objects of perception, he ſometimes refers them to the brain, not only when they are perceived, but when they are remembered or imagined, and this has been held to be the Carteſian doctrine; yet he ſometimes ſays, that we are not to conceive the images or traces in the brain to be perceived, as if there were eyes in the brain; but theſe traces are only occaſions on which, by the laws of the union of the ſoul and body, ideas are excited in the mind; and therefore it is not neceſſary that there ſhould be an exact reſemblance between the traces and the things repreſented by them. Des Cartes, it is well known, made the eſſence of the ſoul to conſiſt in thought: he would not allow it to be an unknown ſomething that had the power of thinking; it cannot therefore be without thought: and as he conceived there can be no thought without ideas, the ſoul muſt have had ideas in its firſt formation, which, of conſequence, are innate. See CARTESIAN *Philoſophy*.

Mr. Locke produced a revolution in the modes of thinking among metaphyſicians by his celebrated "Eſſay on the Human Underſtanding," a work, which brought men to think with preciſion on the philoſophy of the human mind, and which contributed at the ſame time to inſpire them with that candour and love of truth, which are the genuine ſpirit of philoſophy. Locke and Des Cartes differed concerning the origin of our ideas. Des Cartes thought that ſome of them were innate; but he demonſtrated that all our ideas are owing to our ſenſes; and that all innate, created, and factitious ideas, are mere chimeras.

Our mind, he ſhews, has not abſolutely any ideas beſides thoſe preſented to it by the ſenſes, and thoſe which it forms by its own operations on thoſe others which the ſenſes furniſh; ſo that a man, deſtitute of one of his ſenſes, would never have any idea belonging to that ſenſe; and, ſuppoſing him deſtitute of all the ſenſes, he would never have any idea at all; external objects having no other way of producing ideas in him, but by means of ſenſation, he would have no ideas, not even of reflection; becauſe, in wanting all ſenſation, he wants that which would excite in him the operations of his mind, which are the objects of his reflection.

It is plain, therefore, there is no innate idea; no general truth, or firſt principle, inherent in the ſoul, and created with it; no immediate object of the mind, before it had perceived external objects by means of the ſenſes, and reflected on that perception. Thoſe ideas only ſeem to be innate, becauſe we find we have them as ſoon as we come to the uſe of reaſon; but they are, in effect, what we formed from the ideas with which the mind was inſenſibly filled by the ſenſes. Thus, when the mind is employed about ſenſible objects, it comes by the ideas of bitter, ſweet, yellow, hard, &c. which we call *ſenſation;* and, when employed about its own operations perceiving and reflecting on them, as employed about the ideas before got by ſenſation, we get the ideas of perception, thinking, doubting, willing, &c. which are called *inward ſenſation,* or *reflection;* and theſe two, *viz.* external material things, as the objects of ſenſation, and the operations of our own minds, as the objects of reflection, are the only originals whence all our ideas have their riſe. When we have conſidered theſe, and their ſeveral modes and combinations, we ſhall find, that they contain our whole ſtock of ideas, inſomuch that the underſtanding does not ſeem to have the leaſt glimmering of any ideas, that it did not receive from one of thoſe ſources.

And thus far the mind appears merely paſſive, as not having it in its power to chooſe whether it will have theſe firſt beginnings, or materials of knowledge, or not. For the objects of ſenſe will obtrude their ideas upon the mind; and the operations of the mind will not let us be without ſome (however obſcure) notion of them.

Mr. Locke aſcribes likewiſe to the mind the power of compounding its ſimple ideas into complex ones of various forms; of repeating them, and adding the repetitions together; of dividing and claſſing them; of comparing them, and from that compariſon, of forming the ideas of their relation; nay, of forming a general idea of a ſpecies or genus, by taking from the idea of an individual every thing by which it is diſtinguiſhed from other individuals of the kind, till at laſt it becomes an abſtract general idea, common to all the individuals of the kind. (See ABSTRACTION.) For the ideas which we have of the different qualities of bodies, according to Locke, we refer to the article QUALITY.

From the ſyſtem of Mr. Locke and of other philoſophers, who conſidered ideas as the immediate objects of all thought, the ingenious biſhop Berkeley (ſee his article) inferred, and undertook to demonſtrate, that there is no ſuch thing as matter in the univerſe, but that all which it contains may be reduced to mind, and ideas in the mind. "It is evident," ſays he in the firſt ſentence of his "Principles of Knowledge, &c." "to any one who takes a ſurvey of the objects of human knowledge, that they are either ideas actually imprinted on the ſenſes; or ſuch as are perceived, by attending to the paſſions and operations of the mind; or laſtly, ideas formed by help of memory and imagination, either compounding, dividing, or barely repreſenting thoſe originally perceived in the foreſaid ways." See EXISTENCE and MATTER.

Berkeley's ſyſtem was adopted by Mr. Arthur Collier, rector of Langford Magna, near Sarum in Wiltſhire, who publiſhed a book in 1713, which he called "Clavis Univerſalis, or a New Enquiry after Truth; being a demonſtration of the non-exiſtence or impoſſibility of an external world." Biſhop Berkeley has widely deviated from the common ſyſtem with regard to ideas, diſtinguiſhing between ideas and notions. He ſpecifies two kinds of ideas, thoſe of ſenſe and thoſe of imagination. "The ideas imprinted on the ſenſes by the Author of Nature," he ſays, "are called real things; and thoſe excited in the imagination, being leſs regular, vivid, and conſtant, are more properly termed ideas, or images of things, which they copy and repreſent. But then our ſenſations, be they never ſo vivid and diſtinct, are nevertheleſs ideas: that is, they exiſt in the mind, or are perceived by it as truly as the ideas of its own framing. The ideas of ſenſe are allowed to have more reality in them; that is, to be more ſtrong, orderly, and coherent, than the creatures of the mind. They are alſo leſs dependent on the ſpirit, or thinking ſubſtance which perceives them, in that they are excited by the will of another, and more powerful ſpirit; yet ſtill they are ideas; and certainly no idea, whether faint or ſtrong, can exiſt, otherwiſe than in a mind perceiving it." Princ. § 33.

By the ideas of ſenſe, the author means the ſenſations we have by means of our ſenſes; concerning which, ſee Sensation. The ideas of imagination, according to Berkeley, are more properly termed ideas, or images of things; or in other words, the images of our ſenſations. With regard to theſe it is obſerved by Dr. Reid, that they are not ſenſations; and that there is no diſtinction between thoſe ideas of imagination and notions, which Berkeley ſays are not ideas; but they ſeem to Dr. Reid perfectly to coincide. See Notion.

The opinion of Leibnitz, concerning the origin of ideas, ſeems to have ſome affinity with innate ideas. He aſſerts the ſoul to be ſimple, and without parts or compoſition; hence he concludes that no created thing can act internally upon it, but that all the changes it undergoes depend upon ſome internal principle.

God has formed every ſoul, ſo as to have different perceptions; ſome diſtinct, many confuſed; and a great number ſo obſcure, as hardly to be perceived. All theſe ideas together repreſent the univerſe; underſtanding by this term every thing that has been, is, or ſhall be. According to the different relations that each particular ſoul has with the univerſe, ſome of its ideas are diſtinct, and diſtinctly repreſent a certain part of the univerſe. The foundation of this opinion is, that as each part of the univerſe, diſtinctly repreſented, has a neceſſary relation with every thing that exiſts, with every thing that has been, or ſhall be, all things being connected, ſo that the one is the conſequence of another; in like manner, the repreſentation of a certain part of the univerſe has a neceſſary and inſeparable relation to the repreſentation of the whole.

From whence it follows, that all diſtinct perceptions of the ſoul being connected with the ideas of all other things, theſe muſt likewiſe be in the ſoul, though obſcurely. In this ſenſe Mr. Leibnitz aſſerted, that the ſoul is the mirror of the univerſe. Now all things that happen in the univerſe, ſucceed each other according to certain laws. In like manner in the ſoul, ideas become ſucceſſively diſtinct according to other laws; which, though they have a relation to the former, are yet conſiſtent with the nature of intelligence.

All human ſouls have the ſame ideas, taking the ideas of each individual collectively. But diſtinct ideas are not the ſame in each; theſe depending upon the relation which each ſoul has to the univerſe; and this relation is different, according to the ſtation which God has pleaſed to aſſign to each. This ſeems a fair repreſentation of Mr. Leibnitz's ſyſtem relating to the origin of ideas; upon which we may remark, that the foundation of this ſyſtem is, that all the parts of the univerſe have a neceſſary connection: but to make juſt concluſions from this propoſition, the connection muſt be ſuch, that things being conſidered in themſelves, no one thing can be ſuppoſed, without all others being ſo neceſſary a conſequence thereof, that the idea of another univerſe, in which there ſhould be any thing belonging to our actual univerſe, muſt be contradictory. . . . . . .

If ſuch a connection took place, what is ſuppoſed concerning obſcure ideas would be true in a certain ſenſe; to wit, that it might be ſaid, that a man who has a diſtinct idea of a triangle, has thereby obſcure ideas of all the properties of this figure, becauſe of the neceſſary connection between theſe laſt ideas and the former.

But no ſuch connection between ideas ſucceeding each other in the ſoul is perceiveable. For if paſſing from a dark place to one that is enlightened, I thereby ſuddenly acquire the ideas of ſeveral objects, never before ſeen, it does not appear that the previous perception of darkneſs muſt neceſſarily lead me to theſe new ideas.

According to this ſyſtem, all our perceptions of external objects would be the ſame, though external things had never exiſted; our perception of them would continue, although, by the power of God, they ſhould be this moment annihilated. We do not perceive external things becauſe they exiſt, but becauſe the ſoul was originally ſo conſtituted as to produce in itſelf all its ſucceſſive changes, and all its ſucceſſive perceptions, independently of the external objects.

Theſe and other difficulties may be urged againſt Mr. Leibnitz's ſyſtem. See Leibnitzian *Philoſophy*.

The ingenious Mr. Harris ſeems to conſider all our ideas as innate; originally impreſſed on our minds by the Deity, and only awakened or called forth by the preſence of external objects. Ideas, he ſays, are of the eſſence of mind, and, therefore, having no relation to corporeal things, cannot be produced by them. But this takes for granted a principle which is contrary to all appearance; *viz.* that the mind is of ſuch a nature as that it can have no poſſible connection with matter, or be properly affected by it. Whatever be the nature of the thinking principle, it ſeems agreeable to fact and univerſal experience to conclude, that it is capable of being affected, either by natural operation or in conſequence of an eſtabliſhed law, by external objects; and that its perceptions correſpond to the ſtate of the corporeal ſyſtem. Beſides, Mr. Harris allows that ſenſible objects have a natural power of awakening ideas; and why may they not have a natural power of originally exciting them in the ſame mind? Mr. Harris farther argues, that his hypotheſis is neceſſary to account for the identity of the ideas of different minds, which could not be explained, if they were only generated from ſenſible objects, which are fluctuating and variable. But it may be replied, that there is an equal identity or diverſity in external objects, as there is in our ideas of them; and the correſpondence between both is ſo ſtrict, as to afford a ſufficient proof, that our ideas have this origin, and no other. This ingenious writer ſuppoſes alſo, that the mental origin of our ideas is neceſſary to account for the correſpondence ſubſiſting between the ideas of the divine mind and thoſe of our's, and conſequently to the communication between him and us. If ſenſation were the only ſource of our ideas, this argument would have conſiderable force; but the contrary appears to be the fact, even upon the ſyſtem of Mr. Locke, and will be more particularly illuſtrated in the ſequel of this article. See Hermes, p. 380. 394, &c. 399, &c. and Prieſtley's Examination of Dr. Reid's Inquiry, &c. p. 334, &c.

According to Mr. Hume's ſyſtem, all perceptions are either impreſſions or ideas, comprehending under the firſt all our ſenſations, paſſions, and emotions, and under the ſecond, the faint images of theſe, when we remember or imagine them; and it is not poſſible for us ſo much as to conceive any thing ſpecifically different from ideas and impreſſions; and ſince all ideas are copied from impreſſions, we can therefore have no idea or conception of any thing of which we have not received an impreſſion. No man can have any idea of power or energy, becauſe he has never received any impreſſion of it; and for the ſame reaſon no man can have any idea of ſelf. What we call a body is only a bundle of ſenſations; and what we call a mind, is nothing but a bundle or collection of different perceptions, or of thoughts, paſſions, and emotions, which ſucceed each other with inconceivable rapidity, and are in a perpetual flux and movement, without any ſubject. There is properly, ſays Mr. Hume, no ſimplicity in the mind at one time, nor identity at different times, whatever natural propenſion we may have to imagine that ſimplicity and identity. They are the ſucceſſive perceptions only that conſtitute the mind; ſo that there is nothing in the univerſe but impreſſions and ideas; all poſſible perceptions being comprehended in thoſe two claſſes. Conſequently, this philoſophy, excluding body and mind, admits of no exiſtence whatſoever, not even of a percipient being to be the ſubject of theſe perceptions.

Dr. Price, in his "Inquiry into the Original of our Ideas," has taken occaſion to remark, that the ſyſtem of Mr. Locke, which aſcribes all our ideas to ſenſation and reflection, is materially defective; for, if by ſenſation we underſtand the effects ariſing from the impreſſions made on our minds by external objects, and by reflection the notice which the mind takes of its own operations, it will be impoſſible to derive ſome of the moſt important of our ideas from them. This excellent reaſoner obſerves, that the power within us that underſtands, the intuition of the mind, or the faculty in it that diſcerns truth, that views, compares, and judges of all ideas and things, is a ſpring of new ſimple ideas, or original, primary, and uncompounded perceptions of the mind. To this ſource he refers our ideas of the impenetrability and *vis inertiæ* of matter, ſubſtance, duration, ſpace, infinity, neceſſity, contingency, poſſibility, impoſſibility, power, cauſation, &c. all our abſtract ideas (ſee ABSTRACTION), and alſo our ideas of moral right and wrong, and of moral obligation. It is, he ſays, of the eſſence of theſe ideas to imply ſomething true or falſe of an object, and that they by no means denote the manner in which we are affected by it: ſo that they cannot, with any propriety, be referred to that part of our conſtitution, which has been diſtinguiſhed by the appellation of ſenſe. Accordingly, our ideas may be divided, firſt, into thoſe implying nothing real without the mind, or nothing real and true, beſides its own affections and paſſions; to which claſs we may refer the immediate effects of impreſſions on the bodily ſenſes, without ſuppoſing any previous ideas, as all taſtes, ſmells, colours, &c. and thoſe that ariſe upon occaſion only of other ideas; as the effects in us of conſidering order, happineſs, the beauties of poetry, painting, &c. Secondly, into thoſe which are images of ſomething diſtinct from ſenſation, or which imply real, independent exiſtence and truth; which may be ſubdivided into ſuch as denote the real properties of external objects, and the actions and paſſions of the mind; and thoſe which are derived immediately from intelligence. By the notices conveyed to the mind through the organs of the body, or its obſervation of the neceſſary attendants and concomitants of certain ſenſations and impreſſions, it perceives the figure, extenſion, motion, and other primary qualities of material ſubſtances; by contemplating itſelf, it perceives the properties of ſpiritual ſubſtances, volition, conſciouſneſs, memory, &c. To all theſe ideas it is eſſential that they have real, certain, invariable archetypes, actually exiſting, to which they are referred, and to which they are conformable. Theſe ideas again become objects or archetypes to the intellective faculty from whence ariſes a new ſet of ideas, which are the perceptions of this faculty, and repreſent not the mind's own affections, but neceſſary truth. Antecedently to theſe, whatever other ideas we may be furniſhed with, nothing is underſtood; whatever ſeeds or ſubjects of knowledge may be in the mind, nothing is known. Price's Review, &c. of Morals, ſect. 2 and 3.

The ſyſtem of Mr. Locke, with regard to the origin of our ideas, has been lately attacked with conſiderable force of argument as well as confidence by Dr. Reid and others; and it has been charged with being the foundation of univerſal ſcepticiſm.

Dr. Reid ſuggeſts that Mr. Locke has been ſometimes miſled by the ambiguity of the word *idea*, which he often uſes in different ſenſes. In common uſe this word has two meanings, *viz.* a popular and a philoſophical. In the popular meaning, to have an idea of any thing, ſignifies nothing more than to think of it. But philoſophers, ancient and modern, have maintained, that the operations of the mind, like the tools of an artificer, can only be employed upon objects that are preſent, in the mind, or in the brain, where the mind is ſuppoſed to reſide. Therefore, objects that are diſtant in time or place, muſt have a repreſentative in the mind, or in the brain; ſome image or picture, which is the object contemplated by the mind. This of late has been called an *idea*, and every thought is conceived to have an idea of its object. Hence it has happened, that philoſophers have been apt to confound the operation of the mind in thinking with the idea or object of thought, which is ſuppoſed to be its inſeparable concomitant. Thought, and the object of thought, however, are different things, and ought to be diſtinguiſhed.

Mr. Locke is charged with uſing the word idea, without any intimation of the ambiguity of the word, ſometimes to ſignify thought, or the operation of the mind in thinking, and ſometimes to ſignify thoſe internal objects of thought which philoſophers ſuppoſe; and this, it is apprehended, is the true ſource of ſeveral paradoxical opinions that occur in his excellent work. In explaining this word, Mr. Locke ſays that he uſes it for whatever is meant by phantaſm, notion, ſpecies; ſo that we have here three ſynonyms for the word idea. The firſt and laſt are very proper to expreſs the philoſophical meaning of the word, being terms of art in the Peripatetic philoſophy, and ſignifying images of external things in the mind, which, according to that philoſophy, are objects of thought. But the word *notion* is a word in common language, whoſe meaning agrees exactly with the popular, but not with the philoſophical, meaning of the word *idea*. The frequent uſe of the word in theſe two ſenſes is the cauſe of confuſion and of miſapprehenſion in the reader. Beſides, there is a third ſenſe in which he uſes the word, and that is to denote objects of thought that are not in the mind, but external. Thus we ſee, that the word has three different meanings in the "Eſſay;" and the author ſeems to have uſed it ſometimes in one, and ſometimes in another, without being aware of any change in the meaning. The reader ſlides eaſily into the ſame fallacy.

Dr. Reid objects to every ſyſtem which ſuppoſes that the mind receives images of things from without, by means of the ſenſes, becauſe ſenſations bear no reſemblance to bodies or any of their qualities. With regard to extenſion, figure, motion, &c. he ſays, if they are not ideas of ſenſation, nor like to any ſenſation, then the ideal ſyſtem is a rope of ſand, and all the laboured arguments of the ſceptical philoſophy againſt a material world, and againſt the exiſtence of every thing but impreſſions and ideas, proceed upon a falſe hypotheſis. To this objection it has been replied, that ideas are only, in a figurative ſenſe, the images of external things; that certain impreſſions are conveyed to the mind by means of the organs of ſenſe, and their correſponding nerves, between which, and the ſenſations exiſting in the mind, there is a real and neceſſary, though at preſent an unknown connection; and that the ſame reaſoning would lead him to deny, that ſounds are produced by bodies ſtriking againſt one another, becauſe he can perceive no proper reſemblance between the cauſe and the effect.

Dr. Reid farther objects to the notion generally received among philoſophers, that the images of external objects are conveyed by the organs of ſenſe to the brain, and there perceived by the mind. But from this objection it might be inferred, that the whole ſyſtem of our ſenſes, nerves, and brain, is of no real uſe whatever; becauſe it is impoſſible to ſay how they act upon the mind, or the mind upon them.

It is alſo objected, that Mr. Locke's diviſion of ideas into thoſe of ſenſation, and thoſe of reflection, is contrary to all the rules of logic; becauſe the ſecond member of the diviſion includes the firſt. For can we, ſays he, form clear and juſt notions of our ſenſations any other way than by reflection? Senſation is an operation of the mind of which we are conſcious, and we get the notion of it by reflecting upon that which we are conſcious of. In like manner, doubting and believing are operations of the mind, whereof we are conſcious, and we get the notion of them by reflecting upon what we are conſcious of. The ideas of ſenſation, therefore, are ideas of reflection, as much as the ideas of doubting or believing, or any other idea whatſoever. But it has been alleged, that the author confounds the *ideas of ſenſation* with the *idea of ſenſation itſelf*, which is, without doubt, of the ſame claſs with the ideas of doubting, &c. as Mr. Locke would have allowed. But the ideas belonging to the claſs of ſenſation do not require any ſcientifical knowledge of that power, or any reflection upon it. If this were the caſe, brute animals, having no proper ideas of reflection, could have no ideas of ſenſation; and the caſe would be the ſame with the bulk of mankind. In another place, Dr. Reid acknowledges, that human beings may have ideas of mere ſenſation ſome time before they diſcover any power of reflection, and that this power may diſcover itſelf, and come into exerciſe afterwards.

Againſt the philoſophical opinion of the "Eſſay" and its advocates, Dr. Reid ſums up his objections in the following reflections, which we ſhall briefly mention, without any further detail, which our limits will not allow. 1. This opinion is directly contrary to the univerſal ſenſe of men who have not been inſtructed in philoſophy. 2. The authors who have treated of ideas have generally taken their exiſtence for granted, as a thing that could not be called in queſtion; and ſuch arguments as they have mentioned incidentally, in order to prove it, ſeem too weak to ſupport the concluſion. 3. Philoſophers, notwithſtanding their unanimity as to the exiſtence of ideas, hardly agree in any one thing elſe concerning them. If ideas be not a mere fiction, they muſt be, of all objects of human knowledge, the things we have beſt acceſs to know, and to be acquainted with; yet there is nothing about which men differ ſo much. 4. Ideas do not make any of the operations of the mind to be better underſtood, although it was probably with that view that they have been firſt invented, and afterwards ſo generally received. 5. The natural and neceſſary conſequences of this theory furniſh a juſt prejudice againſt it to every man who pays a due regard to the common ſenſe of mankind.

Reid farther obſerves, that, according to Mr. Locke's ſyſtem, ideas being the only objects of thought, and having no exiſtence but when we are conſcious of them, it neceſſarily follows, that there is no object of our thought which can have a continued and permanent exiſtence. Body and ſpirit, cauſe and effect, time and ſpace, to which we were wont to aſcribe an exiſtence independent of our thought, are all turned out of exiſtence by this ſhort dilemma. Either theſe things are ideas of ſenſation or reflection, or they are not: if they are ideas of ſenſation or reflection, they can have no exiſtence but when we are conſcious of them: if they are not ideas of ſenſation or reflection, they are words without any meaning. To which we ſhall only reply, that we have the ſame reaſon to believe, that mind exiſts as that body exiſts; ſince it is only by that name that we diſtinguiſh the ſubject of certain powers or properties of which we are conſcious, as perception, memory, will, &c. and we have juſt the ſame reaſon to believe the identity of an idea as that of any external body, or that of our own minds.

Dr. Beattie, Dr. Oſwald, and others, have purſued and extended the ſame kind of reaſoning againſt the principles of Mr. Locke; and alleged, that Berkeley's reaſoning againſt the exiſtence of a material world, and Hume's reaſoning againſt the exiſtence both of ſoul and body, are deduced from Locke's Eſſay, and the Principia of Des Cartes. For an account of Berkeley's ſyſtem, ſee ABSTRACTION, BODY, and EXISTENCE.

In oppoſition to this ſyſtem, Dr. Reid, and thoſe who have adopted his theory, have recurred to certain inſtinctive principles; alleging, that our perceptions neceſſarily imply the belief of the preſent exiſtence of external objects; and that the real, ſeparate, and independent exiſtence of matter is believed, not becauſe it can be proved by argument, but becauſe the conſtitution of our nature is ſuch, that we muſt believe it; and that we cannot in our own minds ſeparate the belief of external objects from our ſenſations. However, it has been urged by an ingenious writer, that Mr. Locke's doctrine is not ſo favourable to Mr. Berkeley's theory as Dr. Reid's; and that a ſyſtem which aſcribes our primary mental operations to mere conſtitution and feeling, is more favourable to ſcepticiſm than that in the room of which it is ſubſtituted.

Thoſe who wiſh to be farther acquainted with the controverſy relating to the nature and origin of our ideas, muſt be referred to Hume's Treatiſe of Human Nature, vol. i. p. 123, &c. 282, &c. 434, &c. Reid's Inquiry into the Human Mind, paſſim. Eſſays on the Intellectual Powers of Man, Eſſ. ii. Beattie's Eſſay on Truth, part ii. chap. 2. Prieſtley's Examination of Reid, Beattie, &c. paſſim. See *Common* SENSE.

For an account of Dr. Hartley's ſyſtem of the generation of our ideas, ſee ASSOCIATION, VIBRATION, and VIBRATIUNCLE.

The term idea has, by Mr. Locke, been extended to every thing we know or have any notion of, any thing about which the mind is employed in thinking. But this extenſive uſe of the term idea is thought improper by a very ingenious and acute writer, who obſerves, that we may be ſaid to have ſome knowledge or notion of our own minds, of ſpirits and active beings, whereof in a ſtrict ſenſe we have not ideas. In like manner, we know and have a notion of relations between things or ideas, which relations are diſtinct from the ideas or things related, inaſmuch as the latter may be perceived by us, without our perceiving the former. The ſame author elſewhere obſerves, that by *mind*, *ſpirit*, *ſoul*, or *ſelf*, he does not denote any one of his ideas, but a thing entirely diſtinct from them; wherein they exiſt, or, which is the ſame thing, whereby they are perceived; for the exiſtence of an idea conſiſts, as he ſays, in being perceived. He alſo obſerves, the word *thing*, or *being*, is the moſt general name of all, and comprehends under it two kinds entirely diſtinct and heterogeneous; having nothing common but the name, to wit, *ſpirits* and *ideas*. And in another part of his treatiſe, he expreſsly affirms, there can be no idea formed of a ſoul or ſpirit. Berkeley's Princ. of Human Knowledge, § 2. 27. 89. 142.

Another author has alſo blamed Mr. Locke for confounding ideas and notions. He obſerves, that by idea, according to the common and moſt uſual ſignification of the word, is meant the image, picture, or repreſentation in the mind of a ſenſible appearance, or of an object which hath before been perceived by ſenſe. To which ſenſible appearance therefore the idea neceſſarily refers, for whatever is in it, or upon any account can be aſcribed to it; and it ſerves, or is made uſe of in its ſtead, for the mind to contemplate or employ itſelf about in thinking, at ſuch time when the object it repreſents is not immediately perceived, as in the act of ſenſe. Vide p. 105, 106 of a book, intitled "Two Diſſertations concerning Senſe and the Imagination, with an Eſſay on Conſciouſneſs." Lond. 1728. 8vo.

This author farther aſſerts, in oppoſition to Mr. Locke, that the perception of an idea is not an act of the underſtanding. He urges, that an idea, by Mr. Locke's own account of it, is an object, or ſomething perceived, and about which the mind is employed in thinking. Wherefore if perception (ſuppoſe), which is an operation or act of the mind, ſhould itſelf be conſidered as an idea (and under this very title Mr. Locke treats of perception), then one idea would be the object of another idea, and ſo there would be an idea of an idea, or an object of an object; and one idea would perceive another idea, which there is no making any tolerable ſenſe of. And indeed in explaining or declaring the operation of any faculty, to give it the ſame name and appellation with the object itſelf about which it is employed, and which there is a neceſſity of conſidering, in order to ſet forth the particular quality and nature of the operation, and the preciſe manner of its concerning and having to do with the object, ſeems very inconſiſtent with ſuch a purpoſe or deſign.

This author has been very elaborate in proving and enforcing the diſtinction between notions and ideas. In another treatiſe he obſerves, that Mr. Locke, in his Eſſay on Human Underſtanding, takes no notice of rational notions, and thereby has not only given a partial and imperfect account of his ſubject, but made an unjuſt and unfair repreſentation of it. Vide an Eſſay concerning Rational Notions, printed at London, 1723.

That ſome confuſion may have ariſen from giving the ſame name to theſe heterogeneous things, cannot be queſtioned. However, Mr. Locke is, in this reſpect, no more guilty than Malebranche and the Carteſians, who uſe the term idea in the ſame extenſive ſenſe with him, and from whom, indeed, he ſeems to have taken it. But then the Carteſians ſeem to have been more ſolicitous to diſtinguiſh between the ideas of the imagination, and thoſe of the intellect, underſtanding, or *de l'eſprit pur*, as they ſometimes expreſs themſelves, and have thereby guarded againſt the inconveniences ariſing from the too general ſignification of the term idea. See Notion.

Ideas, according to Mr. Locke, are divided into *ſimple* and *complex*.

Ideas, *ſimple*, include all thoſe which come into the mind by ſenſation; and though the qualities of bodies that affect our ſenſes, are in the things themſelves ſo mixed and united, that there is no ſeparation between them, yet the ideas they produce in the mind are ſimple and unmixed. Again, ſome of theſe ideas we acquire purely by means of one ſenſe; as the ideas of colours, only by the eye; of ſounds by the ear; of heat by the touch, &c. Other ideas we gain by ſeveral ſenſes, as of ſpace, extenſion, figure, reſt, motion, &c. for theſe have their effect both on the ſight and the touch. Others, again, are had from reflection only; ſuch as thoſe of perception and willing. There are other ſimple ideas, again, formed in the mind both by ſenſation and reflection jointly, as thoſe of pleaſure, pain, power, exiſtence, unity, ſucceſſion, &c. And ſome of theſe kinds of ideas are all, or at leaſt the moſt conſiderable, of thoſe ſimple ideas which the mind hath, and out of which is made all its other knowledge.

The better to comprehend the nature of ſimple ideas, it will be convenient to diſtinguiſh between them, as they are ideas of perceptions in our minds, and as they are modifications of the bodies that cauſe ſuch perceptions in us, that we may not think, as is uſually done, that they are exactly the images and reſemblances of ſomething inherent in the object; for moſt of thoſe of ſenſation are in the mind no more the likeneſs of any thing exiſting without us, than the names that ſtand for them are the likeneſs of the ideas.

But here the qualities of bodies which produce thoſe ideas in our minds, are to be diſtinguiſhed into *primary* and *ſecondary*. *Primary* qualities are ſuch as are utterly inſeparable from the body, in what ſtate ſoever it be, and ſuch as our ſenſes conſtantly find in every particle of matter; which are ſolidity, extenſion, figure, mobility, and the like. *Secondary* qualities are ſuch, as are, in reality, nothing in the objects themſelves, but only powers to produce various ſenſations in us, by means of their primary qualities: that is, by the figure, bulk, texture, &c. of their particles, as colours, ſounds, taſte, &c.

Now the ideas of primary qualities are, in ſome ſenſe, reſemblances of them, and their patterns do really exiſt in the bodies themſelves; but the ideas produced in us by thoſe ſecondary qualities have no reſemblance of them at all. There is nothing like our ideas exiſting in the bodies themſelves that occaſion them: they are, in the bodies we denominate from them, only a power to produce thoſe ſenſations in us; and what is ſweet, warm, blue, &c. in the idea, is no more than the bulk, figure, and motion of the particles of the bodies themſelves, which we call ſo. See Quality.

The mind has ſeveral faculties for managing theſe ſimple ideas, which are worthy of notice: as, 1. That of diſcerning juſtly, and diſtinguiſhing rightly, between one and another; in which conſiſts the accuracy of judgment.

2. That of comparing them one with another, in reſpect of extent, degree, time, place, or any other circumſtances of relation or dependence, one on another.

3. That of compounding, or putting together, the ſimple ideas received by ſenſation and reflection, in order to make complex ones.

4. Children, by repeated ſenſations, having got ſome ideas fixed in their memories, by degrees learn the uſe of ſigns, and when they can ſpeak articulately, they make uſe of words to ſignify their ideas to others.

Hence, the uſe of words being to ſtand as outward marks of our internal ideas, and thoſe ideas being taken from particular things, if every particular idea that we take in ſhould have a particular name affixed to it, names would become endleſs. To prevent this inconvenience, the mind has another faculty, whereby it can make the particular ideas received from ſuch objects become general; which is done by conſidering them as they are in the mind, ſuch appearances, ſeparate from all other exiſtences, and circumſtances of exiſtence, as time, place, and other concomitant ideas; and this is called *abſtraction*, whereby ideas, taken from particular things, become general repreſentatives of all of that kind, and their names, general names, applicable

plicable to whatever exiſts conformable to ſuch abſtract ideas. Thus, the ſame colour being obſerved to-day in chalk or ſnow, which we obſerved yeſterday in paper or milk, we conſider that appearance alone makes it a repreſentative of all of the ſame kind, and gives it the name of *whiteneſs* ; by which ſound we always ſignify the ſame quality, whereſoever to be met with, or imagined.

From the powers of combining, comparing, and ſeparating, or abſtracting ſimple ideas, acquired by ſenſation and reflection, all our complex ideas are formed ; and, as before, in the perception of ideas, the underſtanding was paſſive, ſo here it is active, exerting the power it hath in the ſeveral acts and faculties above mentioned, in order to frame compound ideas.

Ideas, *complex*, though their number be infinite, and their variety endleſs, yet may all be reduced to theſe three heads ; *viz. modes*, *ſubſtances*, and *relations*. *Modes* are ſuch complex ideas as, however compounded, are not ſuppoſed to exiſt by themſelves, but are conſidered as dependences on, or affections of, ſubſtances: ſuch are the ideas ſignified by the words *triangle*, *gratitude*, *murder*, &c.

Theſe are of two kinds : 1. Such as are only variations, or different combinations, of the ſame ſimple idea, without the mixture of any other ; as a dozen, a ſcore, &c. which may be called *ſimple modes*. 2. There are others, compounded of ſimple ideas, of ſeveral ſorts put together, to make one complex one ; as *beauty*, *theft*, &c.

Subſtances have their ideas from ſuch combinations of ſimple ideas, as are taken to repreſent diſtinct particular things ſubſiſting by themſelves ; in which the ſuppoſed or confuſed idea of ſubſtance, ſuch as it is, is always the firſt and chief.

Relations are a kind of complex ideas, ariſing from the conſideration or compariſon of one idea with another. Of theſe, ſome only depend on the equality or exceſs of the ſame ſimple idea in ſeveral ſubjects ; and theſe may be called *proportional relations* ; ſuch as *equal*, *more*, *bigger*, *ſweeter*. Another occaſion of comparing things together is owing to the circumſtances of their origin and beginning ; which not being afterwards to be altered, make the relations depending thereon as laſting as the ſubjects to which they belong. Thus it is with natural relations, as *father*, *mother*, *uncle*, *couſin*, &c. Thus alſo it is with relations by inſtitution, as *prince* and *people*, *general* and *army*, &c. As to moral relations, they are the conformity or diſagreement of men's free actions to laws and rules, whether human or divine.

Farther, *Ideas* may be divided into *clear* or *diſtinct* ; and *obſcure* or *confuſed*.

Ideas, *ſimple*, are *clear*, when they continue ſuch as the objects preſent them to us when our organs of ſenſation are in good tone and order ; when our memories retain them, and can produce and preſent them to the mind whenever it has occaſion to conſider them ; and when, with this, the mind ſees that theſe ſimple ideas are ſeverally different one from another. The contrary to which is what we call *obſcurity* and *confuſion* of ideas.

A *diſtinct* idea is that wherein the mind perceives a difference from all others ; and a *confuſed* idea is ſuch a one as is not ſufficiently diſtinguiſhable from another, with regard to which it ought to be different.

Ideas, again, with reſpect to the objects whence they are taken, of which they are ſuppoſed to repreſent, come under a threefold diſtinction ; being either *real* or *fantaſtical* ; *true* or *falſe* ; *adequate* or *inadequate*.

Ideas, *real*, are ſuch as have a foundation in nature ; or ſuch as have a conformity with the real being or exiſtence of things, or with their archetypes.

Ideas, *fantaſtical* or *chimerical*, are ſuch as have no foundation in nature, nor any conformity with that being to which they are referred, or with their archetypes.

All our *ſimple* ideas are real ; not that they are images or repreſentations of what does exiſt, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us ſuch ſenſations. They are real ideas in us, becauſe by them we diſtinguiſh the qualities that are really in the bodies themſelves ; their reality lies in the ſteady correſpondence they have with the diſtinct conſtitutions of real being ; but whether with thoſe conſtitutions as cauſes or patterns, it matters not, ſo long as they are conſtantly produced by them.

As to *complex* ideas ; in regard they are arbitrary combinations of ſimple ideas put together, and united under one general name, in forming whereof the mind uſes its own liberty, ſome are found *real*, and ſome *imaginary*. 1. Mixed modes and relations, having no other reality than what they have in the minds of men, are real ; nothing more being required to their reality, but a poſſibility of exiſting conformable to them. Theſe ideas, being themſelves archetypes, cannot differ from their archetypes, and ſo they cannot be chimerical, unleſs any one jumbles inconſiſtent ideas in them ; indeed, thoſe that have names aſſigned to them, ought to have a conformity to the ordinary ſignification of thoſe names, to prevent their appearing fantaſtical. 2. Our complex ideas of ſubſtances being made in reference to things exiſting without us, whoſe repreſentations they are thought to be, are no farther real than as they are combinations of ſimple ideas really united and co-exiſting in things without us. Thoſe are fantaſtical that are made up of ſeveral ideas that never were found united, as *centaur*, &c.

Ideas, *real*, are divided into *adequate* and *inadequate*.

Ideas, *adequate*, are thoſe which perfectly repreſent thoſe archetypes which the mind ſuppoſes them taken from, and which it makes them ſtand for.

Ideas, *inadequate*, are ſuch as do but partially, or incompletely, repreſent thoſe archetypes to which they are referred.

Ideas, *as to true and falſe*, it may be obſerved, that truth and falſhood, in propriety of ſpeech, belong only to propoſitions ; and when ideas are termed *true* and *falſe*, there is ſome tacit propoſition, which is the foundation of that denomination. Our ideas, being nothing elſe but appearances or perceptions in the mind, can no more be ſaid to be true or falſe, than ſingle names of things can be ſaid to be ſo ; for truth and falſhood lying always in the affirmation or negation, our ideas are not capable of them, till the mind paſſes ſome judgment of them. In a metaphyſical ſenſe they may be ſaid to be true, *i. e.* to be really as they exiſt ; though in things called *true*, even in that ſenſe, there ſeems to be a ſecret reference to our ideas, looked upon as the ſtandards of that truth ; which amounts to a mental propoſition. When the mind refers its ideas to any thing extraneous to it, they are then capable of being true or falſe ; becauſe, in ſuch a reference, the mind makes a tacit ſuppoſition of their conformity to that thing ; and as this ſuppoſition is true or falſe, ſo the ideas themſelves come to be denominated. Locke's Eſſay, 8vo. vol. i. paſſim.

IDEAL, in *Painting and Sculpture*, is uſed to ſignify a perfection in form, and a beauty in colouring, deduced from the general principles of nature ; but not to be found in any individual perſon or thing of compound ſtructure, when conſidered in all its parts ; ſuch as man, for inſtance.

No man or woman, probably, ever exiſted poſſeſſed of that perfect beauty of form in all their parts, of which thoſe parts are fully capable, conſiſtent with the power to perform their intended functions in the animal economy. Therefore artiſts who aim at repreſenting the human figure in its utmoſt perfection, are of courſe called upon imperatively, to vary in ſome point or other from their models, and to add the beauties of others. This ſelection of perfect parts depending entirely upon taſte, is that ideal in art, (or *beau ideal*, a term adopted from the French,) which is the ſource of ſo much beauty and character in the works of a few artiſts, who poſſeſſed ſuper-eminent talents; and which, being miſunderſtood, or attempted without knowledge and true taſte, is equally the ſource of ſo much vicious affectation and frippery in thoſe of the greater part, whoſe aim is to diſplay it.

Sir Joſhua Reynolds, in his letter publiſhed in the Idler, No. 82, has aptly illuſtrated this ſubject by obſerving, that "among blades of graſs, or leaves of the ſame tree, though no two can be found exactly alike, yet the general form is invariable. A naturaliſt, before he chuſes one as a ſample, would examine many, ſince, if he took the firſt that occurred, it might have, by accident or otherwiſe, ſuch a form as ſcarcely would be known to belong to that ſpecies; he ſelects, like the artiſt, the moſt beautiful, that is, the moſt general form of nature."

Every ſpecies of the animal, as well as the vegetable creation, may be ſaid to have a fixed or determinate form round which nature continually varies in every direction, as a number of radii iſſue from one common centre. To inſtance, in a particular part of the human face, the line that forms the ridge of the noſe is moſt beautiful when it is ſtraight; this, then, is the central form. How infinite are the variations from this line to the convex, concave, and forms made of both, we need not inform our readers. The ſame remarks attach to every portion of the figure. The head, the neck, the trunk, and the limbs are found almoſt as various in form as the features of the face; although the general character is the ſame in all; and fixed for every period of the life of man. In childhood, youth, manhood, and declining years, there are diſtinct and univerſal characteriſtics, whilſt each individual in the ſeparate claſſes is known by his peculiar variations of form and features. It is the duty of the artiſt who practiſes in the higher walks of art, to paint man, and not individuals; to learn the general character of the objects he is to repreſent, and neglect the trifling peculiarities attached to each.

But this ſublime branch of ſtudy in art may be, and has been, carried to exceſs. It properly belongs only to one kind of ſubject, that is, in its more important application; *viz.* the repreſentation of exalted and heroic characters; and of ſcenes, where the actors are few. Thoſe ſubjects which relate to the common tranſactions of mankind, do not ſo poſitively require it. In them a greater degree of preciſe imitation is allowed, indeed required; and where many figures are introduced, the variety of characters requiſite, will demand variations from the central form. But even then, unleſs the ſcene is taken from vulgar ordinary life, the different characters muſt not be too minutely wrought. It is true, a thin man muſt be repreſented ſpare of fleſh; and a fat one poſſeſſing redundancy; but then all the wrinkles commonly attendant upon both are not neceſſary to mark their characters. Judgment and taſte alone can ſelect thoſe which are ſo; and one of the moſt difficult leſſons an artiſt has to learn, is, what to omit when he is copying from nature. That much may be omitted, and yet every feature neceſſary for true and effective repreſentation retained, is evident from every portrait that ever was painted; even by the meanly inſtructed pencil of Denner, who attempted to repreſent the hairs of the beard, and the grainy texture of the ſkin; and did it with much ſkill. But are his pictures more like human beings, that is, do they convey an idea of them to the mind of an obſerver, more ſtrongly than the free and manly works of Vandyke and ſir J. Reynolds, who totally diſregarded thoſe minutiæ!

The rejection of thoſe trifling points is the ideal of portrait painting, and what alone raiſes it to an exalted rank in the ſcale of art. Without it, the painter of portraits is not a whit more ingenious, or more deſerving of eſtimation, than he who imitates with ingenuity a mahogany cheſt, or any other painter of ſtill life.

The ſame principle holds good in landſcape. Trees ſhould be repreſented with their own peculiar characters, but they need not have all the minute ramifications of their branches exhibited. The *beau ideal* requires in them a general characteriſtic form; and not too frequent a variety of ſpecies. Claude de Lorraine has ſometimes carried this too far, and made all the trees in a picture of one form, or nearly ſo. It certainly aſſiſts in producing ſimplicity; but in this point nature is ſo exceedingly laviſh of variety, that ſome of it is neceſſary to ſatisfy the eye of one accuſtomed to obſerve her productions.

The danger of attempting to produce the ideal in form is that of falling into affectation.

What that ideal in art which ſhould be ſought after is, may beſt be learned by ſtudying the works of the ancient Greek ſculptors; and obſerving wherein they differ from the ordinary forms of nature. The opportunities they poſſeſſed, which are utterly unknown to the inhabitants of northern Europe, of ſeeing the human figure conſtantly naked, and in violent exerciſe, enabled them more ſurely to judge of what was moſt beautiful in the general form; to ſelect ſuch as poſſeſſed thoſe beauties; and unite their various perfections. It is ſaid of Zeuxis the painter, that when employed in painting a Venus, he ſelected twelve of the moſt lovely women of the country, and combined in one figure, the charms for which each was moſt conſpicuous.

The ideal in art, therefore, is not ſomething more beautiful than nature; but nature in her perfect ſtate: and he who attempts to produce it by drawing from his imagination rather than his judgment, will more probably fall into the region of error, than ſoar to the abode of truth. We ſhall have occaſion to ſpeak more of this when we come to treat of ſtyle in deſign. See STYLE.

IDEAL *Beauty in the Fine Arts.* Painters are allowed to talk of the *beau ideal*, who have nature always ſitting to them in ſome garb or other, and they have only to copy her dreſs and attitudes. But with reſpect to muſic, which is entirely a work of art, and of which the beauties as well as deformities are all ideal, it has been aſked by a man of more wit than feeling, what it means to ſay? *Sonate, que veux tu?* And this interrogator was Fontenelle! the moſt ingenious and agreeable writer on ſubjects within his competence, which the French language can boaſt! Ideal, in the common acceptation of the word, implies ſomething which has no reality, and which only exiſts in imagination; but in ſpeaking of the fine arts, this expreſſion, ſo far from being diſputed, often deſcribes the higheſt point of perfection at which they can poſſibly arrive. It is particularly to painting and ſculpture that it has been applied; though it equally belongs to poetry and muſic. There are arts which imitate nothing, or of which the imitations are accidental and feeble: ſuch are architecture and inſtrumental muſic.

Let us conſider the conſtituent parts of muſic—they conſiſt of three elements; melody, harmony, and time or rhythm. We ſhould have mentioned time or meaſure firſt, becauſe we have always found that a regular movement, of which the accents are ſtrongly marked, has more effect on common ears than refined melody; but attention to that increaſes as the ear begins to diſcriminate, and is poliſhed by degrees. But harmony has been invented after the lapſe of many ages, and only brought to perfection by the moderns. However, after innumerable experiments, when not abuſed, it is found to embelliſh melody, and to augment its expreſſion.

Now we ſhould be glad to know what ſhare the *imitation of nature* has had in the cultivation and progreſs of muſic? The warbling of birds is not meaſured, their concerts have no harmony, and are often very diſcordant; nor is their melody appreciable by our organs. The talking of *natural* muſic is therefore abſurd; who does not ſee that all the beauties of muſic are ideal, and produced by experiment, or by that inſtinct which makes us augment and diminiſh, retouch and correct, till we are quite ſatisfied with our work? Let us then be more juſt to the polite arts, and reſtore to them the noble rank which is their due. They not only imitate but invent; and not content to copy nature when practicable, they can embelliſh her. They can expreſs the thoughts of man: thoughts which are only the reſult of ambitious deſires, and the ardour with which he ſeeks pleaſure.

The ideal genus opens a wide field to imagination; for the moment our mind is elevated above ſublunary, vulgar, and familiar objects, it expands in full liberty. Nor is any art better than mechanical, if it ſuffers us to remain wholly diveſted of enthuſiaſm, and is unable to lift us off the ground.

IDENTITATE Nominis, in *Law*, a writ which lies for him who, upon a capias or exigent, is arreſted, and committed to priſon, for another man of the ſame name.

IDENTITY, Sameneſs; that by which a thing is itſelf, and not any thing elſe. In which ſenſe, *identity* differs from *ſimilitude*, as well as *diverſity*.

Our idea of identity we owe to that power which the mind has of comparing the very being of things; whereby, conſidering any thing as exiſting at any certain time and place, and comparing it with itſelf as exiſting at any other time, &c. we accordingly pronounce it the ſame.

When we ſee any thing in any certain time and place, we are ſure it is that very thing, and can be no other, how like ſoever it may be to ſomething elſe in all other reſpects; becauſe we conceive it impoſſible, that two things of the ſame kind ſhould exiſt together in the ſame place, we conclude, that whatever exiſts any where at the ſame time, excludes all of the ſame kind, and is there itſelf alone. When, therefore, we demand, whether any thing be the ſame or no, it refers always to ſomething that exiſted at ſuch a time, in ſuch a place; which it was certain, at that inſtant, was the ſame with itſelf, and no other. Identity, therefore, evidently ſuppoſes an uninterrupted continuance of exiſtence.

We have ideas of three ſorts of ſubſtances: of God; of finite intelligences; and of bodies. God being eternal, unalterable, and every where, concerning his identity there can be no doubt. Finite ſpirits having had their determinate place, and time of beginning to exiſt, the relation to that time and place will always determine to each its identity as long as it exiſts. And the ſame will hold of every particle of matter to which no addition, or from which no ſubtraction, is made. Theſe three exclude not one another out of the ſame place; yet each exclude thoſe of the ſame kind out of the ſame place. The identity and diverſity of modes and relations is determined after the ſame manner that thoſe of ſubſtances are; only the actions of finite beings, as motion and thought, conſiſting in ſucceſſion, cannot exiſt in different times and places as permanent beings: for no motion or thought, conſidered as at different times, can be the ſame; each part thereof having a different beginning of exiſtence. From whence it is plain, that exiſtence itſelf is the *principium individuationis*, which determines a being to a particular time and place incommunicable to two beings of the ſame kind.

Thus, ſuppoſe an atom exiſting in a determined time and place, it is evident, that, conſidered in any inſtant, it is the ſame with itſelf, and will be ſo, as long as its exiſtence continues. The ſame may be ſaid of two, or more, or any number of particles, whilſt they continue together, the maſs will be the ſame, however jumbled; but if one atom be taken away, it is then not the ſame maſs. But in vegetables, the identity depends not on the ſame maſs, and is not applied to the ſame thing: the reaſon of this is, the difference between an inanimate body, and a crude maſs of matter; this latter being only the coheſion of particles any how united, the other ſuch a diſpoſition of organization of parts, as is fit to receive and diſtribute nouriſhment, ſo as to continue and frame the wood, bark, leaves, &c. (of an oak, for inſtance) in which conſiſts the vegetable life. That, therefore, which hath ſuch an organization of parts, partaking of one common life, continues to be the ſame plant, though that life be communicated to new particles of matter vitally united to the living plant. The caſe is not ſo much different in brutes, but that any one may hence ſee what makes an animal, and continues it the ſame. The identity of the ſame man likewiſe conſiſts in a participation of the ſame continued life, in ſucceeding particles of matter vitally united to the ſame organized body.

To underſtand identity aright, we muſt conſider what idea the word ſtands for; it being one thing to be the ſame ſubſtance; another, the ſame man; and a third, the ſame perſon. An animal is a living organized body; and the ſame animal is the ſame continued life communicated to different particles of matter, as they happen ſucceſſively to be united to that organized living body; and our notion of man is but of a particular ſort of animal. Perſon ſtands for an intelligent being, that reaſons and reflects, and can conſider itſelf the ſame thing in different times and places, which it doth by that conſciouſneſs that is inſeparable from thinking. By this every one is to himſelf, what he calls *ſelf*, without conſidering whether that ſelf be continued in the ſame, or in diverſe ſubſtances. In this conſiſts perſonal identity, or the ſameneſs of a rational being; and ſo far as this conſciouſneſs extends backward to any paſt action, or thought ſo far reaches the identity of that perſon. It is the ſelf ſame now it was then; and it is by the ſame ſelf, with this preſent one, and that now reflects on it, that that action was done. Self is that conſcious thinking thing, whatever ſubſtance it matters not, which is conſcious of pleaſure and pain, capable of happineſs or miſery; and ſo is concerned for itſelf as far as that conſciouſneſs extends. That with which the conſciouſneſs of this preſent thinking can join itſelf, makes the *ſame* perſon, and is one ſelf with it; and ſo attributes to itſelf, and owns all the actions of that thing as its own, as far as that conſciouſneſs reaches. Perſonality is ſomething that cannot be divided, or conſiſt of parts. It is in the ſtricteſt ſenſe what Leibnitz calls a *Monad*, which ſee; and perſonal identity implies the continued exiſtence of that indiviſible thing called ſelf; which, whatever be its preciſe nature, thinks, deliberates, reſolves, acts, and ſuffers. It is not thought, action, feeling; but ſomething that thinks, acts, and ſuffers my thoughts, actions, and feelings to change every moment; they have no continued, but a ſucceſſive exiſtence; but that *ſelf*, or *I*, to which they belong, is permanent, and has the ſame relation to all the ſucceeding thoughts, actions, and feelings, which I call mine. Should it be aſked, what evidences have you that there is ſuch a permanent ſelf which has a claim to all the thoughts, actions, and feelings, which you call yours? It is replied, that the proper evidence I have of all this is remembrance, or, as ſome expreſs it, conſciouſneſs.

Conſciouſneſs, ſays the excellent biſhop Butler, of what is paſt, aſcertains our perſonal identity to ourſelves; yet to ſay that it makes perſonal identity, or is neceſſary to our being the ſame perſons, is to ſay, that a perſon has not exiſted a ſingle moment, nor done one action but what he can remember: indeed, none but what he reflects upon. And one ſhould really think it ſelf-evident, that conſciouſneſs of perſonal identity preſuppoſes, and, therefore, cannot conſtitute perſonal identity; any more than knowledge in any other caſe can conſtitute truth which it preſuppoſes. Though preſent conſciouſneſs of what we at preſent do and feel is neceſſary to our being the perſons we now are; yet preſent conſciouſneſs of paſt actions or feelings is not neceſſary to our being the ſame perſons who performed thoſe actions, or had thoſe feelings. The identity of perſons cannot ſubſiſt with diverſity of ſubſtance: perſonal identity is, therefore, as Mr. Locke expreſſes it, the ſameneſs of a rational being; and the queſtion, whether the ſame rational being is the ſame ſubſtance, needs no anſwer; becauſe being and ſubſtance, in this caſe, ſtand for the ſame idea. Conſequently, though the ſucceſſive conſciouſneſſes which we have of our own exiſtence are not the ſame, yet they are conſciouſneſſes of one and the ſame thing or object; of the ſame perſon, ſelf, or living agent. The perſon of whoſe exiſtence the conſciouſneſs is felt now, and was felt an hour or a year ago, is diſcerned to be, not two perſons, but one and the ſame perſon, and, therefore, is one and the ſame. Butler's Analogy, Append. Diſſ. 1.

The identity of a perſon is a perfect identity: wherever it is real, it admits of no degrees; and it is impoſſible that a perſon ſhould be the ſame in part, and in part different; becauſe, as we have already ſaid, a perſon is a monad, and is not diviſible into parts. But the evidence of identity in other perſons beſides ourſelves admits of various degrees, from what we account certainty to the leaſt degree of probability. But ſtill it is true, that the ſame perſon is perfectly the ſame, and cannot be ſo in part, or in ſome degree only. We probably at firſt derive our notion of identity from that natural conviction which every man has from the dawn of reaſon of his own identity and continued exiſtence. The operations of our minds are all ſucceſſive, and have no continued exiſtence: but the thinking being has a continued exiſtence, and we have an invincible belief that it remains the ſame when all its thoughts and operations change. The evidence we have of our own identity, as far back as we remember, is totally of a different kind from the evidence we have of the identity of other perſons, or of objects of ſenſe. The firſt is grounded on memory, and gives undoubted certainty. The laſt is grounded on ſimilarity and on other circumſtances, which in many caſes are not ſo deciſive as to leave no room for doubt. See Reid's Eſſays, Eſſ. iii. chap. 4.

This perſonal identity is the object of reward and puniſhment, being that by which every one is concerned for himſelf. If the conſciouſneſs went along with the little finger; when that was cut off it would be the ſame ſelf, that was juſt before concerned for the whole body. If the ſame Socrates, waking and ſleeping, did not partake of the ſame conſciouſneſs, he would not be the ſame perſon: Socrates waking could not be, in juſtice, accountable for what Socrates ſleeping did; no more than one twin for what his brother-twin did; becauſe their outſides were ſo like that they could not be diſtinguiſhed.

But ſuppoſe I wholly loſe the memory of ſome parts of my life, beyond a poſſibility of retrieving them, ſo that I ſhall never be conſcious of them again; am I not again the ſame perſon that did thoſe actions though I have forgotten them? I anſwer, we muſt here take notice what the word *I* is applied to, which in this caſe is the man only; and the ſame man being preſumed to be the ſame perſon, *I* is eaſily here ſuppoſed to ſtand alſo for the ſame perſon. But if it be poſſible for the ſame man to have a diſtinct, incommunicable conſciouſneſs at different times, it is paſt doubt the ſame man would, at different times, make different perſons; which we ſee is the ſenſe of mankind in the moſt ſolemn declaration of their opinions; human laws not puniſhing the madman for the ſober man's actions, nor the ſober man for what the madman did; thereby making them two perſons.

Thus we ſay, in Engliſh, ſuch a one is not himſelf, or is beſide himſelf; in which phraſe it is inſinuated, that ſelf is changed, and the ſelf ſame perſon is no longer in that man. But is not a man, drunk or ſober, the ſame perſon? Why elſe is he puniſhed for the ſame fact he commits when drunk, though he be never afterwards conſcious of it? Juſt as much the ſame perſon as a man that walks and does other things in his ſleep, is the ſame perſon, and is anſwerable for any miſchief he ſhall do in it. Human laws puniſh with a juſtice ſuitable to their way of knowledge; becauſe in theſe caſes they cannot diſtinguiſh certainly what is real, and what is counterfeit; and ſo the ignorance in drunkenneſs, or ſleep, is not admitted as a plea. For though puniſhment be annexed to perſonality, and perſonality to conſciouſneſs, and the drunkard is not conſcious, perhaps, of what he did, yet human judicatures juſtly puniſh him, becauſe the fact is proved againſt him; but want of conſciouſneſs cannot be proved for him. But in the great day, wherein the ſecrets of all hearts ſhall be laid open, it may be reaſonable to think no one ſhall be made to anſwer for what he knows nothing of, but ſhall receive his doom; his own conſcience accuſing, or elſe excuſing him.

To conclude this article, whatever ſubſtance begins to exiſt, it muſt, during its exiſtence, be the ſame; whatever compoſition of ſubſtances begin to exiſt, during the union of thoſe ſubſtances, the concrete muſt be the ſame. Whatſoever mode begins to exiſt, during its exiſtence it is the ſame; and ſo if the compoſition be of diſtinct ſubſtances and different modes, the ſame rule holds. Whence it appears, that the difficulty or obſcurity that has been about this matter, rather ariſes from names ill uſed, than from any obſcurity in the things themſelves. For whatever makes the ſpecific idea, to which the name is applied, if that idea be kept ſteadily to, the diſtinction of any thing into the ſame and diverſe, will eaſily be conceived. Locke's Eſſays, vol. i. chap. 27.

IDEOT. See IDIOT and LUNATIC.

IDES, IDUS, in the *Roman Calendar*, a denomination given to eight days in each month; commencing in the months of March, May, July, and October, on the fifteenth day; and in the other months on the thirteenth day; and reckoned backward, ſo as in the four months above ſpecified to terminate on the eighth day, and in the reſt on the ſixth.

The origin of the word is conteſted. Some will have it formed from ιδειν, *to ſee;* becauſe the full moon was commonly ſeen on the day of the ides; others from ειδος, *ſpecies, figure,* on account of the image of the full moon then viſible; others from *idulium,* or *ovis idulis,* a name given by the Etrurians to a victim offered on that day to Jupiter; others from the Etrurian word *iduo, i. e. divido;* becauſe the ides divided the moon into two nearly equal parts.

The ides came between the calends and the nones.

The 15th day in March, May, July, and October, and the 13th of the other months, being called the ides of thoſe months; *idus Martii, Maii,* &c. the 14th day of the ſame four months, and the 12th of the other eight, were *pridie idus,* or the eve of the ides of March, &c. the 13th day in the four months, and the 11th in the eight, was called the third of the ides of ſuch months, 3 *idus Martii,* &c. ſo the 12th day in the four, and the 10th in the eight months, were the fourth of the ides, 4 *idus Martii,* &c. and thus of the reſt, to the eighth and ſixth days, which made the eighth of the ides, 8 *idus Martii,* &c.

This way of accounting is ſtill in uſe in the Roman chancery, and the calendar of the breviary. The ides of May were conſecrated to Mercury; the ides of March were always eſteemed unhappy after Cæſar's murder; the time after the ides of June was reckoned fortunate for thoſe who entered into matrimony; the ides of Auguſt were conſecrated to Diana, and were obſerved as a feaſt day by the ſlaves; on the ides of September, auguries were taken for appointing the magiſtrates, who formerly entered into their offices on the ides of May, and afterwards on thoſe of March.

IDJE, or Secja, in *Geography,* a povince of Japan.

IDIOM, Ιδιωμα, *propriety,* of ιδιος, *proper, own,* is ſometimes uſed for the peculiarities of a language; ſometimes for a dialect, or the language of ſome particular province; differing, in ſome reſpects, from the language of the nation, in general, whence it is derived.

Idioms, *Communication of.* See Communication.

IDIOPATHIC, in *Medicine,* an epithet derived from ιδιος, *proper,* or *peculiar,* and παθος, *affection,* and denoting ſuch an indiſpoſition or diſeaſe as properly and originally belongs to the part of the body in which it appears, and is not cauſed by any other or preceding diſeaſe, nor dependent on diſeaſe in any other part of the body. Hence *idiopathic* ſtands in oppoſition to *ſympathic,* or *ſymptomatic,* and *idiopathy* (an obſolete term) to *ſympathy;* the ſympathic or ſymptomatic affections being ſuch as ariſe in conſequence of ſome prior diſorder in ſome other part of the body. Thus when vomiting ariſes from inflammation in the ſtomach, it is ſaid to be *idiopathic;* when it ariſes from injury done to the brain, from a ſtone in the kidney, or from the ſtate of the uterus in pregnancy, it is *ſympathic, ſympathetic,* or *ſymptomatic* of the diſeaſed ſtate of theſe diſtant organs.

IDIOSYNCRASY, from ιδιος, *peculiar,* συν, *with,* and κρασις, *temperament,* ſignifies the peculiar diſpoſition or conſtitution of individuals, in conſequence of which particular agents operate upon them, in a manner different from their ordinary mode of action upon perſons in general, or peculiar inclinations and averſions, whether in health or ſickneſs, manifeſt themſelves. Thus certain articles of diet, as ſhell-fiſh, bitter almonds, &c. taken in the ſmalleſt quantity, immediately excite, in ſome individuals, an eruption or raſh on the ſkin; which is aſcribed to the peculiar idioſyncraſy of ſuch individuals. From a ſimilar cauſe, the operation of medicines is variouſly modified; a ſmall doſe, which is altogether inert in one habit, will operate violently in another; a drug, which does not offend the ſtomach, but purges the bowels, in one perſon, will invariably excite vomiting in another; and ſo on, according to the different idioſyncraſy of each.

IDIOT, Ideot, in the *Engliſh Laws,* denotes a natural fool, or a perſon who hath had no underſtanding from his birth; and therefore in law preſumed never likely to attain any.

The word is originally Greek, ιδιωτης, which primarily imports a *private perſon,* or one who leads a private life, without any ſhare or concern in the government of affairs.

A perſon who has underſtanding enough to meaſure a yard of cloth, number twenty rightly, and tell the days of the week, his parents, his age, &c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is conſidered by the law in the ſame ſtate as an idiot; being ſuppoſed incapable of any underſtanding, as wanting all thoſe ſenſes which furniſh the human mind with ideas. (4 Inſt. 203. Com. Journ. 1610.) For this reaſon the cuſtody of an idiot and his lands was formerly veſted in the lord of the fee (Flet. l. i. c. 11. § 10.); and therefore ſtill, by ſpecial cuſtom in ſome manors, the lord ſhall have the ordering of idiot and lunatic copy-holders (Dyer, 302. Hutt. 17. Noy. 27.); but by reaſon of the manifold abuſes of this power by ſubjects, it was at laſt provided by common conſent, that it ſhould be given to the king as the general conſervator of his people; in order to prevent the idiot from waſting his eſtate, and reducing himſelf and his heirs to poverty and diſtreſs. (F. N. B. 232.) This fixed prerogative of the king is declared in parliament by ſtatute 17 Edw. II. c. 9. which directs (in affirmance of the common law, 4 Rep. 126.) that the king ſhall have ward of the lands of natural fools, taking the profits without waſte or deſtruction, and ſhall find them neceſſaries; and after the death of ſuch idiots he ſhall render the eſtate to the heirs; in order to prevent ſuch idiots from aliening their lands, and their heirs from being diſinherited. Idiots, and perſons of non-ſane memory, are not totally diſabled either to convey or purchaſe, but *ſub modo* only. For their conveyances and purchaſes are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. See Non-compos.

For the cuſtody of idiots, ſee Custody.

In criminal caſes idiots and lunatics are not chargeable for their own acts, if committed under theſe incapacities; not even for treaſon itſelf. 3 Inſt. 6. See Lunatic.

If a man be found by a jury an idiot, *a nativitate,* he may come in perſon into the chancery before the chancellor, or be brought there by his friends, to be inſpected and examined, whether idiot or not; and if, upon ſuch view and inquiry, it appears he is not ſo, the verdict of the jury, and all the proceedings thereon, are utterly void, and inſtantly of no effect. 9 Rep. 31.

Idiotiſm conſtitutes an incapacity for entering into the matrimonial contract, in which caſe it is not valid. (1 Roll. Abr. 357.) It was formerly adjudged that the iſſue of an idiot was legitimate, and conſequently that his marriage was valid. This muſt have been a ſtrange determination; ſince conſent is abſolutely requiſite to matrimony, and neither idiots nor lunatics are capable of conſenting to any thing. And therefore the civil law judged much more ſenſibly when it made ſuch deprivations of reaſon a previous impediment; though not a cauſe of divorce, if they happened after marriage. Ff. 23. tit. i. l. 8. and tit. ii. l. 16. See Marriage.

Idiot, *Idiota,* is alſo uſed by ancient writers for a perſon ignorant, or unlearned; anſwering to *illiteratus,* or *imperitus.*

ritus. In this ſenſe, Victor tells us, in his Chronicon, that, in the conſulſhip of Meſſala, the holy Goſpels, by command of the emperor Anaſtaſius, were corrected and amended, as having been written by idiot evangeliſts: "Tanquam ab idiotis evangeliſtis compoſita."

Idiot, or Ιδιωτης, is properly a perſon in a private ſtation; and ſo the word ſhould have been rendered, Acts, iv. 13. and not "ignorant," an epithet by no means applicable to the apoſtles Peter and John. The term Ιδιωτης is alſo uſed, not only in oppoſition to a public magiſtrate, but likewiſe as the oppoſite of a public ſpeaker: and St. Paul has uſed it, 1 Cor. xiv. 16. in the ſenſe of "hearer." From this epithet, Ιδιωτης λογω, which he himſelf has aſſumed, 2 Cor. xi. 6. ſome perſons have unwarrantably inferred that his language has a tincture of vulgarity. Whereas Ιδιωτης λογω expreſſes nothing more than a man who is no orator, who pays no attention to the elegance of language, but ſpeaks in the dialect of common converſation. In oppoſition to ιδιωτης λογω, St. Paul adds, αλλ' ȣ τη γνωσει, in which he was not ιδιωτης, but a teacher and apoſtle. The word may poſſibly be applied to the deviation from claſſic purity obſervable in the ſtyle of St. Paul, which an author who attempted only to pleaſe, might have cultivated with more attention; but ſetting all idioms aſide, the whole expreſſion is applicable to every man who delivers plain truths in artleſs language. A profeſſor in an univerſity, who is attentive to the accuracy of criticiſm, but regardleſs of the graces of compoſition, is in the ſtricteſt ſenſe ιδιωτης λογω αλλ' ȣ τη γνωσει.

IDIOTA *inquirendo vel examinando, De*, a writ iſſued out to the ſheriff of a county, where the king has notice that there is an idiot naturally born, ſo weak of underſtanding, that he cannot govern or manage his inheritance; directing him to call before him the party ſuſpected, and examine him, and enquire, by a jury of twelve men, whether he be an idiot or not (F. N. B. 232.); and if they find him *purus idiota*, the profits of his lands, and the cuſtody of his perſon, may be granted by the king to ſome ſubject, who has intereſt enough to obtain them. See Idiot.

This hath been long conſidered as a great hardſhip upon private families; but few inſtances occur of the oppreſſive exertion of it.

IDIOTISM, derived from ιδιος, *proper, peculiar*, in *Grammar*, a phraſe, or manner of ſpeaking, peculiar to a language, and which cannot be rendered word for word into any other.

Idiotiſm is defined, by ſome authors, an inflection of ſome verb, or a particular conſtruction of ſome phraſe or particle, that is anomalous, and deviates from the ordinary rule of the language of the nation, but which is in uſe in ſome particular province of it. Or, it denotes the employing of *e. g.* an Engliſh word in a ſenſe which it bears in ſome provincial dialect, in low and partial uſe, and which perhaps the correſponding word bears in ſome foreign tongue, but unſupported by general uſe in our own language.

Several authors have written of the idiotiſms in the Greek and Latin languages; that is, of the particular turns in thoſe tongues which vary the moſt from each other, and from the more popular among the modern tongues; but the examples of theſe idiotiſms being borrowed from the beſt authors, idiotiſm, in this ſenſe, cannot properly be called an irregularity.

Idiotiſms, taken in the ſenſe of vulgariſms, have been unjuſtly aſcribed to the language of the New Teſtament. Whilſt we cannot contend with Palairet, Blackwall, and others, for the claſſical purity of the language of the New Teſtament, we can by no means aſſent to the declaration of Heumann, who, in his notes on the New Teſtament, aſſerts that it is written in the very worſt Greek, and in the language of the vulgar; that many words and phraſes have been uſed in a ſenſe unknown to the claſſics, and given them only by the populace; and that their meaning is not to be diſcovered by the help of the Greek writers, but merely from conjecture on the general connexion. As the charge of vulgarity has never been proved, and the idiotiſms, which are not ſo numerous as he has pretended, may be explained by other means than mere conjecture, the whole edifice which he has erected on this baſis falls of itſelf to the ground. Count Zinzendorf is no leſs miſtaken, who has pretended to diſcover in the ſermons of Chriſt certain idiotiſms, in uſe only among the common workmen of Nazareth, that is, vulgar Syriac expreſſions, tranſlated literally into Greek; and this he has attempted to ſhew in paſſages, where ſeveral commentators have diſcovered myſteries. To this charge it has been replied that rabbiniſms, not vulgariſms, muſt be ſought for in the ſermons of Chriſt; for the Jews themſelves, aſtoniſhed at a language which they did not expect from an education in Nazareth, applied to it an epithet, λογοι χαριτος, Luke, iv. 22., which belongs only to the graces of a poliſhed ſtyle. See Michaelis's Introd. to the New Teſtament, by Herb. Marſh, vol. i. p. 172.

IDITA, a name, among Hindoo mythologiſts, of Parvati, the conſort of Siva. In this, as well as in numerous other inſtances, Parvati correſponds in character with the Grecian Diana, who, under the name of Lucina, was invoked by the heathens of Europe, as preſiding over child-birth; and was in this character alſo called Ilythia. So with the Hindoos, Parvati, the Sakti or energy of Siva, the power of reproduction, is invoked, with an appropriate burnt offering of certain perfumes, by women in labour, under the title of Idita, or Ilita; words in Sanſcrit implying *praiſe*; and applied to the goddeſs, becauſe ſhe is *praiſed* by women requiring, or having received, her aſſiſtance. See Parvati.

IDLE River, in *Geography*, in Nottinghamſhire and Yorkſhire, is navigable from its fall into Trent at Stockwith, to the town of Bawtry; as mentioned, with other particulars, in our article Canal. About 21,000 acres of the county of Derby drains to this river; the ſtrata interſected by its channels, and other particulars reſpecting the upper parts of this river, will be found in Mr. Farey's Agricultural and Mineral Report on Derbyſhire, vol. i.

IDLENESS, in *Law*. See Vagabond.

IDOL, from ειδωλον, which ſignifies the ſame, of ειδος, *image, figure*, a ſtatue or image of ſome falſe god, to whom divine honours are paid, altars and temples erected, and ſacrifices offered.

The idol or image, whatever materials it conſiſted of, was by certain ceremonies called conſecration, converted into a god. While under the artificer's hands, it was only a mere ſtatue.

Three things were neceſſary in order to change it into a god; proper ornaments, conſecration, and oration. The ornaments were various, and wholly deſigned to blind the eyes of the ignorant and ſtupid multitude, who are chiefly taken with ſhow and pageantry. Then followed the conſecration and oration, which were performed with great ſolemnity among the Romans.

IDOLA, in *Geography*, a ſmall iſland in the Adriatic. N. lat. 44° 25'. E. long. 15° 10'.

IDOLATRY, from ειδωλολατρεια, which ſignifies the ſame; compoſed of ειδος, *image*, and λατρευειν, *to ſerve*, the worſhip and adoration of falſe gods; or the giving thoſe honours to creatures, or the works of man's hands, which are only due to God.

Several have written of the origin and cauſes of idolatry: among the reſt, Voſſius, Selden, Godwyn, and Tenniſon; but it is ſtill a doubt who was the firſt author of it. It is generally allowed, however, that it had not its beginning till after the deluge; and many are of opinion, that Belus, who is ſuppoſed to be the ſame with Nimrod, was the firſt man that was deified.

But whether they had not paid divine honours to the heavenly bodies before that time, cannot be determined; our acquaintance with thoſe remote times being extremely ſlender.

All that can be ſaid with certainty is, that 426 years after the deluge, when God led Terah and his family out of Chaldea, and Abraham paſſed over Meſopotamia, Canaan, the kingdom of the Philiſtines, and Egypt, it does not appear that idolatry had then got any footing in any of thoſe countries; though ſome idly pretend, that Abraham himſelf was an idolater.

The firſt mention we find made of it is in Gen. xxxi. 19. where Rachel is ſaid to have taken the idols of her father: for though the meaning of the Hebrew word *theraphim*, תרפים, be diſputed, yet it is pretty evident they were idols. Laban calls them his gods, and Jacob calls them ſtrange gods, and looks on them as abominations. See THERAPHIM.

The original idolatry by image worſhip is by many attributed to the age of Eber, 2247 B. C. about 101 years after the deluge, according to the Hebrew chronology; 401 years according to the Samaritan; and 531 years according to the Septuagint; though moſt of the fathers place it no higher than that of Serug; which ſeems to be the more probable opinion, conſidering that for the firſt 134 years of Eber's life all mankind dwelt in a body together; during which time it is not reaſonable to ſuppoſe that idolatry broke in upon them; then ſome time muſt be allowed after the diſperſion of the ſeveral nations, which were but ſmall at the beginning, to increaſe and ſettle themſelves; ſo that if idolatry was introduced in Eber's time, it muſt have been towards the end of his life, and could not well have prevailed ſo univerſally, and with that obſtinacy, which ſome authors have imagined. Terah, the father of Abraham, who lived at Ur, in Chaldea, about 2000 years B. C., was unqueſtionably an idolater; for he is expreſsly ſaid in ſcripture to have ſerved other gods. The eaſtern authors unanimouſly agree, that he was a ſtatuary or carver of idols; and he is repreſented as the firſt who made images of clay, pictures having only been in uſe before; and who taught that they were to be adored as gods. It is ſaid, that he was converted by Abraham. The authors of the Univerſal Hiſtory think, that the origin and progreſs of idolatry is plainly pointed out to us in the account which Moſes gives of Laban's and Jacob's parting, Gen. xxxi. 44, &c. From the cuſtom once introduced of erecting monuments in memory of any ſolemn covenants, the tranſition was eaſy into the notion, that ſome deity took its reſidence in them, in order to puniſh the firſt aggreſſors; and this might be ſoon improved by an ignorant and degenerate world, till not only birds, beaſts, ſtocks, and ſtones, but ſun, moon, and ſtars, were called into the ſame office; though uſed, perhaps, at firſt, by the deſigning part of mankind, as ſcare-crows, to over-awe the ignorant. Univ. Hiſt. vol. i. part ii. p. 853. edit. fol.

Cluverius, German. Antiq. lib. i. maintains Cain to have been the firſt idolater; and the falſe gods that he worſhipped to have been the ſtars, to whom he ſuppoſed God had left the government of the lower world; but this is mere conjecture.

Sanchoniathon, who wrote his Phœnician Antiquities, apparently with a view to apologize for idolatry, traces its origin to the deſcendants of Cain, the elder branch, who began with the worſhip of the ſun, and afterwards added a variety of other methods of idolatrous worſhip: proceeding to deify the ſeveral parts of nature, and men after their death, and even to conſecrate the plants ſhooting out of the earth, which the firſt men judged to be gods, and worſhipped as thoſe that ſuſtained the lives of themſelves and of their poſterity. Cumberl. on Sanchon. p. 219, &c.

The Chaldæan prieſts, in proceſs of time, being by their ſituation early addicted to celeſtial obſervations, inſtead of conceiving as they ought to have done concerning the omnipotence of the Creator, and mover of the heavenly bodies, fell into the impious error of eſteeming them as gods, and the immediate governors of the world, in ſubordination, however, to the Deity, who was inviſible except by his works, and the effects of his power. Concluding that God had created the ſtars and great luminaries, for the government of the world, partakers with himſelf and as his miniſters, they thought it but juſt and natural that they ſhould be honoured and extolled, and that it was the will of God they ſhould be magnified and worſhipped. Accordingly they erected temples, or *ſacella*, to the ſtars, in which they ſacrificed and bowed down before them, eſteeming them as a kind of mediators between God and man. Impoſtors afterwards aroſe, who gave out, that they had received expreſs orders from God himſelf concerning the manner in which particular heavenly bodies ſhould be repreſented, and the nature and ceremonies of the worſhip which was to be paid them. When they proceeded to worſhip wood, ſtone, or metal, formed and faſhioned by their own hands, they were led to apprehend, that theſe images had been, in ſome way or other, animated or informed with a ſupernatnral power by ſupernatural means; though Dr. Prideaux imagines, that, being at a loſs to know how to addreſs themſelves to the planets when they were below the horizon, and inviſible, they recurred to the uſe of images. Dr. Prideaux's Connection, &c. book iii. p. 177. 8vo.

But it will be ſufficient to ſuppoſe, that they were perſuaded that each ſtar or planet was actuated by an intelligence; and that the virtues of the heavenly body were infuſed into the image that repreſented it. It is certain, that the ſentient nature and divinity of the ſun, moon, and ſtars, was ſtrenuouſly aſſerted by the philoſophers, particularly by Pythagoras and his followers, (Diogen. Laert. lib. viii. p. 509.) and by the Stoics (Cicero, De Nat. Deor. lib. ii. cap. 15.) as well as believed by the common people, and was indeed the very foundation of the Pagan idolatry. The heavenly bodies were the firſt deities of all the idolatrous nations, were eſteemed eternal, ſovereign, and ſupreme, and diſtinguiſhed by the title of the natural gods. Thus we find that the primary gods of the heathens in general were Saturn, Jupiter, Mars, Apollo, Mercury, Venus, and Diana; by which we can underſtand no other than the ſun and moon, and the five greateſt luminaries next to theſe. Plutarch expreſsly cenſures the Epicureans for aſſerting that the ſun and moon are void of intelligence, whom all men worſhipped. Adv. Colotem. p. 1123.

Sanchoniathon (apud Euſeb. Præp. Evan. lib. i. cap. 9.) repreſents the moſt ancient nations, particularly the Phœnicians and Egyptians, as acknowledging only the natural gods, the ſun, moon, planets, and elements; and Plato declares it as his opinion, that the firſt Grecians likewiſe held theſe only to be gods, as many of the barbarians in his time did. In Cratyl. p. 273. F. See alſo Herodot. lib. i. cap. 131. 238. lib. iii. cap. 16. Diod Sic. lib. i. p. 10, 11. ed. Rhodom. Strab. Geogr. lib. xv. p. 732. Polyb. Hiſt. lib. vii. p. 699.

p. 699, 700. ed. Gronov. Euſeb. Præp. Ev. lib. ii. cap. 2. p. 59. Even Philo (Lib. De Somniis) and Origen (in his books Περι Αρχων) maintain, that the ſtars are ſo many ſouls incorruptible and immortal. See Farmer on Miracles, chap. iii. § 2.

Beſides theſe natural gods, the heathens believed, that there were certain ſpirits who held a middle rank between the gods and men on earth, and carried on all intercourſe between them; conveying the addreſſes of men to the gods, and the divine benefits to men. Theſe ſpirits were called dæmons. From this imaginary office aſcribed to them, they became the grand objects of the religious hopes and fears of the Pagans, of immediate dependence and divine worſhip. In the moſt learned nations, they did not ſo properly ſhare, as engroſs the public devotion. To theſe alone ſacrifices were offered, while the celeſtial gods were worſhipped only with a pure mind, or with hymns and praiſes. As to the nature of theſe dæmons, it has been generally believed, that they were ſpirits of a higher origin than the human race; and in ſupport of this opinion, it has been alleged, that the ſupreme deity of the Pagans is called the greateſt dæmon; that dæmons are deſcribed as beings placed between the gods and men; and that dæmons are expreſsly diſtinguiſhed from heroes, who were the departed ſouls of men. A late ingenious writer has, with great acuteneſs and erudition, combatted this opinion, and maintained, on the contrary, that by dæmons, ſuch as were the more immediate objects of the eſtabliſhed worſhip amongſt the ancient nations, particularly the Egyptians, Greeks, and Romans, we are to underſtand beings of an earthly origin, or ſuch departed human ſouls as were believed to become dæmons. This, he ſays, is a fact atteſted by all antiquity, whether Pagan, Jewiſh, or Chriſtian. He appeals to the teſtimonies of the heathen hiſtorians, poets, and philoſophers, and to the nature of the worſhip paid to the heathen deities. He examines the authority of the Old Teſtament writers; of the authors of the Septuagint verſion; of Philo and Joſephus; of the New Teſtament; and of the Chriſtian fathers. For a farther view of the maſterly manner in which this argument is treated, ſee Farmer on Miracles, chap. iii. § 2. paſſim. Farmer on Dæmoniacs, § 2. See DÆMON and MIRACLES.

Voltaire, in the art. *Idole*, Encylopédie, labours to vindicate the heathens in general from the charge of idolatry. He ſays, that there has not exiſted any people on earth who aſſumed the name of idolaters; and that no ſuch term is found in Homer, or Heſiod, or Herodotus, or any author of the Pagan religion; and that no law was ever enacted, requiring the ultimate worſhip of idols. The Greeks and Romans, he ſays, were gentiles and polytheiſts, but not idolaters; they worſhipped the gods by means of theſe images, and not the images themſelves; and were no more chargeable with idolatrous worſhip than the votaries of the Romiſh church. He alſo extends his laboured and ſpirited vindication to the Perſians, Sabians, Egyptians, Tartars, and Turks; and obſerves, that it is an abuſe of terms to call thoſe people idolaters who worſhip the ſun and ſtars, &c.

Although the Hindoo inhabitants of the Eaſt Indies deny the charge of idolatry, uſing the ſame deſcription of arguments that are ſo inconcluſively urged by European practitioners of that dangerous ſpecies of adoration, in defence of image worſhip, it is ſtill evident that the maſs of the Hindoos are addicted to groſs idolatry. Scarcely were the gods of Rome more numerous, certainly leſs whimſical and monſtrous, than their brethren, or perhaps parents, at Benares. It is, however, reaſonable to conclude, that among the thinking portion of both cities were many individuals who, contemplating, although unaided by revelation imperfectly, the attributes of the archetype, contemned the artifices by which prieſtcraft had contrived to direct the worſhip of their deluded flock, to types and ſymbols; thus rendering myſterious what is in itſelf plain, that the initiated alone might poſſeſs the key of the myſtery they had invented and taught; be the intereſted medium through which the deity muſt be propitiated, and themſelves dimly ſeen with awe amid the obſcurity of their own creating.

In Moor's Hindoo Pantheon are given exact portraits of many ſcores of deities worſhipped, with appropriate ceremonies, and under various forms and names, by different ſects of that groſsly ſuperſtitious race. Some of theſe portraits are of images coloſſal, to a degree perhaps unequalled by any exiſting ſtatues. (See the article JAINA.) Of others, exceedingly diminutive, ſome are of metallic caſts, and apparently extremely ancient, which exhibit every gradation of art from the rudeſt imaginable ſpecimen, up to a very reſpectable portion of ſkill; and even to elegance of form, and to eaſe and expreſſion of attitude.

Some writers on the religious or ſuperſtitious practices of the Eaſt Indians, have related, that certain of their deities muſt, or muſt not, be of this or that metal or wood: but admitting that the Hindoos recognize practically the notion that *ex quovis ligno*, &c. Major Moor, in his Hindoo Pantheon, proves that the particulars related on that point are erroneous; as he has ſeen, and indeed gives frequent examples of images made of the very material that, in reſpect of ſuch individual deity, was ſaid to be unlawful. Another point, too, connected with this ſubject, he has corrected: for, prior to the publication of the Hindoo Pantheon, and indeed ſince, it has been aſſerted that the Hindoos admit no image of Brahma, the perſonification of the deity's creative power. (See BRACHMANS and SIVA.) This is not true of Brahma; of him ſeveral repreſentations from images are given in that work: but of Brahm, the deity, the one omnipotent, of whoſe attributes or powers Brahma, Viſhnu, and Siva are perſonifications, no images or repreſentations are extant among the Hindoos. In their ſcripture, the Veda, (ſee VEDA,) it is declared, that "of Him whoſe glory is ſo great, there is no image." The word "image" is not, perhaps, in this inſtance, to be taken in its moſt confined ſenſe.

This awful reverence of the deity prevails, it may be ſaid, throughout and beyond India, in prevention of any "graven image or likeneſs" of him being attempted, and we cannot but think the interdiction grounded on that feeling highly ſalutary. Among the Mahometans, indeed, the reverential feeling is carried farther, and to an extent not perhaps neceſſary; for as well as all repreſentation of the perſon of God, the prohibition extends alſo to that of the prophet, and no picture or ſtatue of Mahomet is in exiſtence.

It is, to return to Hindoo idols, a circumſtance very creditable to the exterior morality of that extraordinary people, that no indecent exhibitions are even witneſſed in their mythological delineations or ſculptures. Major Moor ſays, (Hin. Pan. page 383.) that among the hundreds, perhaps thouſands, of mythological ſubjects that came under his notice within the laſt few years of his reſidence in India, not one was, in any reſpect, offenſive to decency. Such images, he believes, are never ſeen in India; at any rate they are certainly very rare, or among ſo many ſubjects ſome inſtance of their exiſtence muſt have occurred. The Linga and Yoni even, however groſs abſtractedly, are not indecently repreſented; their alluſions are not obtruſive, but are veiled in myſterious decency, and muſt, thus happily hidden from the vulgar eye, be extorted by philoſophical curioſity. See LINGA and YONI.

The principal cauſes that have been aſſigned for idolatry are, the indelible idea which every man has of God, and the evidence which he gives of it to himſelf; an inviolable attachment to the ſenſes, and a habit of judging and deciding by them, and them only; the pride and vanity of the human mind, which is not ſatisfied with ſimple truth, but mingles and adulterates it with fables; the ignorance of antiquity, or of the firſt times, and the firſt men whereof we have but very dark and confuſed knowledge by tradition, they having left no written monuments or books; the ignorance and change of languages; the ſtyle of the oriental writings, which is figurative and poetical, and perſonifies every thing; the ſuperſtition, ſcruples, and fears, inſpired by religion; the flattery of writers; the falſe relations of travellers; the fictions of poets; the imaginations of painters and ſculptors; a ſmattering of phyſics, that is, a ſlight acquaintance with natural bodies and appearances, and their cauſes; the eſtabliſhment of colonies, and the invention of arts, miſtaken by barbarous people; the artifices of prieſts; the pride of certain men, who have affected to paſs for gods; the love and gratitude borne by the people to certain of their great men and benefactors; and finally, the Scripture themſelves ill underſtood. One great ſpring and fountain of all idolatry, in the four quarters of the globe, ſays ſir William Jones (Aſ. Reſ. vol. i. p. 426.), was the veneration paid by men to the ſun, or vaſt body of fire, which "looks from his ſole dominion like the god of this world;" and another, the immoderate reſpect ſhewn to the memory of powerful or virtuous anceſtors and warriors, of whom the ſun and the moon were wildly ſuppoſed to be the parents. See IMAGE.

IDOLKA, in *Geography*, a town of Lithuania, in the palatinate of Troki; 26 miles S.W. of Troki.

IDOLOPŒIA, Ειδολοποιία, in *Rhetoric*, a ſpecies of proſopopœia, where dead perſons are ſuppoſed to ſpeak.

IDOLOTHYTA, Ειδωλοθυτα, things offered in ſacrifice to idols; concerning the uſe of which, the apoſtle Paul lays down rules in 1 Corinth. chap. viii. ver. 4. 7. and 10.

IDOLS, *Iſlands of*, in *Geography*, a cluſter of ſmall iſlands in the Atlantic, near the coaſt of Africa. N. lat. 8° 50′.

IDOMENÆ, in *Ancient Geography*, a town of Macedonia, placed by Ptolemy in Emathia, and repreſented by Hierocles as an epiſcopal city.

IDOMENT, in *Geography*, a town of European Turkey, in the province of Macedonia; 26 miles N.N.E. of Edeſſa.

IDRA, a ſmall iſland in the Adriatic. N. lat. 44° 6′. E. long. 15° 28′.

IDRAULICO, *Ital.* a word expreſſing every kind of ſonorous inſtrument, the tones of which are produced by the compreſſion of the air by water. See HYDRAULICON.

IDRE, in *Geography*, a town of Sweden, in Dalecarlia; 120 miles N.W. of Fahlun.

IDRIA. See HYDRIA.

IDRIA, *Ban of*, a diſtrict of Carniola, immediately ſubject to the chamber of Inner Auſtria, at Gratz. The quickſilver mines of Idria are celebrated in natural hiſtory, poetry, and romance. They were diſcovered in the year 1499; and the hill of Vogelberg has annually yielded more than 300,000 pounds weight of mercury. The common ore is cinnabar; but ſometimes the pure quickſilver runs through the crevices. Idria is ſurrounded with woody hills; and the Vogelberg on the E. produces oaks and broom, while the interior conſiſts of red clay, calcareous rock, and a black ſoft ſlate, which covers the metallic veins in a ſouthern direction. The deep deſcent is by ladders and ſtairs of ſtone; and the length of the galleries is computed at 316 paces, or 1580 feet. The operations in theſe vaſt mercurial caverns being pernicious to health, are ſometimes allotted as a puniſhment to criminals.

IDRIAS, in *Ancient Geography*, a canton of Phrygia, in the confines of Caria.—Alſo, a town of Caria.

IDRO, in *Geography*, a town of Italy, in the department of Mela, on a lake; 16 miles N.N.E. of Breſcia.

IDSTEIN, a town of Germany, in the principality of Naſſau-Weilburg; 12 miles N. of Mentz. N. lat. 50° 12′. E. long. 8° 12′.

IDSU, a province of Japan, on the S. coaſt of the iſland of Niphon.

IDSUME, a town of Japan, in the iſland of Niphon; 140 miles W.N.W. of Meaco. N. lat. 34° 95′. E. long. 131° 50′.

IDULIA, in *Antiquity*, certain eggs offered to Jupiter on the ides of every month. They were ſo called from their being offered on the ides.

IDUMÆA, in *Ancient Geography*, or *Land of Edom*, a country of Aſia, on the confines of Paleſtine and Arabia, or rather comprehending parts of Paleſtine and Arabia; having Judea on the N., Egypt and a branch of the Red ſea on the W., the reſt of Arabia Petræa on the S., and the deſert of Arabia on the E. Its extent varied in different periods of time. Eſau, or Edom, from whom it derived its name, and his deſcendants, ſettled along the mountains of Sein on the E. and S. of the Dead ſea, from whence they ſpread themſelves by degrees through the W. part of Arabia Petræa, from that ſea quite to the Mediterranean. (See EDOM.) In the time of Moſes, Joſhua, and even of the Jewiſh kings, they were hemmed in by the Dead ſea on one ſide, and the Elanitic gulf on the other; but during the Jewiſh captivity at Babylon, they advanced further N. into Judea, and ſpread themſelves as far as Hebron in the tribe of Judah, taking poſſeſſion of what had formerly been the whole inheritance of the tribe of Simeon, and half of that which had been the inheritance of the tribe of Judah; till at length going over to the religion of the Jews they became incorporated with them into the ſame nation. Joſephus gives this account of their converſion. Hyrcanus took alſo Adora and Mariſſa, cities of Idumæa; and having ſubdued all the Idumæans, he permitted them to remain in the country, upon condition that they would be circumciſed and uſe the Jewiſh laws, and ſubmit to live in every reſpect as Jews. From that time, in the 129th year B.C., they became Jews. Strabo, and after him many later geographers, had divided it into Eaſtern and Southern Idumæa, with regard to its ſituation from Paleſtine. The capital of the former was called "Bozrah," or "Boſſra," and that of the latter "Petra," or "Jactael." Joſephus, with regard to its extent at different periods, diſtinguiſhes it, when at the longeſt, by the epithet of "Great," in oppoſition to its more narrow boundaries, and places Hebron among the Idumæan cities. He ſeems alſo to diſtinguiſh between Lower and Upper Idumæa; but, upon the whole, the country is repreſented as hot, dry, mountainous, and in ſome parts barren; the mountains exhibiting dreadful rocks and caverns like the ſouthern part of Judah, which is called a deſert, full of ſuch rocky receſſes and caverns, which became the lurking-places of thieves and banditti. Concerning its ancient hiſtory, ſee the article EDOM.

Of this country little has been ſaid by modern geographers and travellers, except that it lies moſtly waſte and uncultivated. It is inhabited by wild Arabs, with whom Europeans have little or no intercourſe. The country is now in poſſeſſion of the Turks; though it doth not appear that they keep any garriſons in it, except on the ſea-coaſt, for ſecuring the road between Egypt and Paleſtine. Among the caſtles mentioned by travellers is Lariſſa, to which we may add Salka, near the frontiers of Egypt, the reſidence of the pacha of this province. The Turks keep ſoldiers alſo at Tina, a town on the ſea-ſhore ; Catio, a garriſoned caſtle, where a toll is exacted from all merchants and paſſengers, ſituated in a deſert ; Tor, a ſmall ſea-port and caſtle near the ſtraits of Suez, where an aga commands the garriſon.

IDYLLION, in *Poetry*, a little poem, containing the deſcription or narration of ſome adventures.

The word is derived from the Greek ειδυλλιον, diminutive of ειδος, *figure, repreſentation* ; becauſe this poetry conſiſts in a lively natural image or repreſentation of things.

The learned biſhop Lowth, in his " Prælectiones, &c." defines an idyllion to be a poem of moderate length, of an uniform, middle ſtyle, chiefly diſtinguiſhed for elegance and ſweetneſs ; regular and clear as to plot, conduct, and arrangement.

Theocritus is the oldeſt author who has written idyllions. The Italians imitate him, and have brought the idyllion into modern uſe.

The idyllions of Theocritus have a peculiar delicacy ; they appear with a clowniſh, ruſtic kind of ſimplicity, but are full of the moſt exquiſite beauties ; they ſeem drawn from the breaſt of nature herſelf, and to have been dictated by the graces.

The idyllion is a kind of poetry which paints the objects it deſcribes ; whereas the epic poem relates them, and the dramatic acts them. The modern writers of idyllions do not keep up to that original ſimplicity obſerved by Theocritus ; the people of our days would not bear an amorous fiction, reſembling the awkward gallantries of our peaſants. Boileau obſerves, that the ſhorteſt idyllions are uſually the beſt.

The modern idyllions differ from thoſe of the ancients, by introducing none but allegorical ſhepherds or courtiers diſguiſed in their dreſs ; whereas thoſe of the ancients repreſent true ſhepherds. Mr. Hardion obſerves, that the taſte of the preſent age is ſo very different from that of the ancients in this reſpect, that he would not take upon him to give a literal tranſlation of Theocritus's idyllions ; not that he reckons them bad in themſelves, nor that he condemns the rules followed in their compoſition ; but becauſe the rules that were good at the time thoſe poems were written, would, in the preſent age, be reliſhed but by very few.

The ſubject of idyllions, as being low of itſelf, requires the greateſt elegance of diction to ſet it off. Mr. Hardion is of opinion, that Theocritus has the advantage of Virgil in this reſpect ; obſerving always the ſtructure peculiar to paſtoral poems, which conſtitutes one of its chief beauties. This ſtructure requires that the fourth foot of every verſe ſhould be a dactylus, and ſometimes alſo the firſt, when it can be done without affectation. Beſides, it is alſo neceſſary that theſe dactyli ſhould be made without any cæſura following ; and, if poſſible, there ſhould be a reſt in the ſenſe after each dactyle, which would add greatly to the regularity and perfection of each verſe. Such are the following verſes of Theocritus and Virgil :

> " Ειπε μοι, ω Κορυδων, τινος αι βοες ; η ρα Φιλωνδα."
> Theoc. Idyl. iv. ver. 1.
>
> " Dic mihi, Damæta, cujum pecus ? An Melibæi ?"
> Virg. Ecl. iii. ver. 1.

This ſtructure in paſtoral poems gives a vivacity, which is wonderfully pleaſing in the mouth of a ſhepherd. Theſe rules are obſerved by Theocritus with all the exactneſs poſſible ; but by Virgil ſeldom ; which is rather to be imputed to the genius of the Latin tongue than his want of ability ; it being leſs copious, bold, and pliant, than the Greek. Mem. Acad Inſcript. tom. vi. p. 255, 256.

The invention of the idyllion is aſcribed to Daphnis, who, by his extraordinary genius, ſays Diodorus Siculus, " invented the bucolic poem and ſong, in the form it continues to appear in at preſent in Sicily." This paſſage is conſiderable, as it fully aſcertains the origin of the idyllion, ſuch as it appears in Theocritus, and thoſe that have imitated him.

After Daphnis, another Sicilian ſhepherd, called Diomus, made himſelf famous for his paſtoral poems. Next came Steſichorus, who, according to Ælian, was the firſt that made the misfortunes of Daphnis the ſubject of his ſongs. He lived, as ſome chronologers will have it, in the time of Phalaris, about 550 years before the vulgar era ; and laſtly, ſome ages after this Theocritus appeared, who, forming himſelf on theſe firſt models, ſo far excelled as to give paſtoral poetry all the perfection it was capable of receiving. Mem. Acad. Inſcript. tom. ix. p. 101.

Biſhop Lowth, already cited, produced from the writings of the Hebrews many perfect examples of this kind of poem. The firſt of thoſe poems which deſerve notice are the hiſtorical pſalms, in celebration of the power and other attributes of the Deity, manifeſted in the miracles which he performed in favour of his people. One of the principal of theſe occurs in the 78th pſalm ; the ſtyle of which is ſimple and uniform, but the ſtructure is poetical, and the ſentiments occaſionally ſplendid. Of a ſimilar kind are the 105th and 106th pſalms, very much reſembling the 78th, as well in the ſubject as in the ſtyle. The mixture of eaſe and grace, diſplayed in the exordium, is the ſame in all. Theſe pſalms, both in plot and conduct, bear a ſurpriſing analogy to the hymns of the Greeks ; a ſpecies of poetry which was in very early uſe among them, and almoſt entirely appropriated to the celebration of their religious rites. The ſubjects in general were the origin of the gods, the places of their birth, their achievements, and the other circumſtances of their hiſtory. Such are all the poems of this kind now extant in the Greek ; ſuch are the elegant hymns of Callimachus, as well as thoſe which are attributed to Homer. The poem of Theocritus, entitled the " Dioſcouri," or the praiſe of Caſtor and Pollux, is alſo a genuine hymn, and very elegant in its kind ; nor is it improperly claſſed among the Idylliums, which include all of this ſpecies. The 136th pſalm may be referred to the claſs of thoſe of the hiſtorical kind. The exordium commences with this well known diſtich :

> " Glorify JEHOVAH, for he is good ;
> For his mercy endureth for ever :"

which, according to Ezra (iii. 10, 11.), was commonly ſung by alternate choirs. Here the latter line of the diſtich, being added by the ſecond choir, and ſubjoined to every verſe (which is a ſingular caſe), forms a perpetual Epode. Hence we may collect the whole nature and form of the intercalary verſe, or burthen of the ſong ; which expreſſes in a clear, conciſe, and ſimple manner ſome particular ſentiment, that ſeems to include virtually the general ſubject or deſign of the poem ; and it is thrown in, at proper intervals, according to the nature and arrangement of it, for the ſake of impreſſing the ſubject more firmly upon the mind. That the intercalary verſe is perfectly congenial to the Idyllium, is evident from the authority of Theocritus, Bion, Moſchus, and even of Virgil. The 107th pſalm may be undoubtedly enumerated among the moſt elegant monuments of antiquity ; and it is chiefly indebted for its elegance to the general plan and conduct of the poem. Another example might be ſelected from Iſaiah; for by uniting the concluſion of the ninth chapter with the beginning of the tenth, ingeniouſly ſeparated by the common diviſion into chapters, we ſhall find a complete and connected prophecy againſt the kingdom of Iſrael or Samaria. (Iſ. ix. 8. x. 4.) It is replete with terror and ſolemnity, and poſſeſſes a degree of force and ſublimity to which the Idyllium ſeldom riſes; though it preſerves the form of the Idyllium ſo perfect and expreſs, that it cannot with propriety be referred to any other claſs. Beſides the inſtances already mentioned there are others, and probably not a few (in the book of Pſalms particularly), which may be equally accounted of the Idyllium ſpecies. To this claſs belong more eſpecially thoſe in which ſome particular ſubject is treated in a more copious and regular manner than is uſual in compoſitions ſtrictly lyric. Such is the 104th pſalm, in which the poet embelliſhes his noble ſubject with the cleareſt and moſt ſplendid colouring of language; and with imagery the moſt magnificent, lively, diverſified, and pleaſing, at the ſame time ſelect, and happily adapted to the ſubject. Nothing, ſays our learned author, of the kind extant, can be conceived more perfect than this hymn, whether we conſider it with reſpect to its intrinſic beauties, or as a model of that ſpecies of compoſition. The Greek hymns conſiſted chiefly of fables, and theſe fables regarded perſons and events, which were neither laudable in themſelves nor greatly to be admired: "indeed," ſays the ingenious prelate, "I do not recollect any that are extant of this ſublime nature, except that of the famous ſtoic Cleanthes, which is inſcribed to Jove, that is, to God the Creator, or, as he expreſſes himſelf, "to the Eternal Mind, the Creator and Governor of nature." It is doubtleſs a moſt noble monument of ancient wiſdom, and replete with truths not leſs ſolid than magnificent."

The hymn of David, juſt mentioned, deſervedly occupies the firſt place in this claſs of poems; and that which comes the neareſt to it, as well in the conduct of the poem as in the beauty of the ſtyle, is the 139th pſalm, which, though perhaps excelled by the former in the plan, diſpoſition, and arrangement of the matter, is not in the leaſt inferior in the dignity and elegance of the figures and imagery.

IDYMA, or Idymus, in *Ancient Geography*, a town and alſo a river of Aſia Minor, in Caria; called *Idimus* by Ptolemy.

IDYRUS, a town and river of Aſia, in Pamphylia.

JEACOCK, Samuel, in *Biography*, brother to the celebrated preſident of the Robin-Hood ſociety, was by trade a baker, and carried his loaves to his cuſtomers on his own ſhoulders. He would not have been mentioned here among muſical dilettanti merely for being fond of muſic, but for a peculiar talent of which we have never known any other perſon poſſeſſed. This worthy tradeſman played a little on ſeveral inſtruments, but chiefly the tenor; and at the Madrigal ſociety, eſtabliſhed in his time, he uſed to ſing the baſe part. He was an excellent judge of inſtruments played with the bow; their ſtrings, tone, and conſtruction; found out their defects, and often cured them. He was one of the beſt ringers and ſwimmers of his time; and even when in years, was very expert in other manly exerciſes. But his moſt extraordinary talent was the being able, without knowing the names of the keys of the harpſichord, to play upon it, with his 10 fingers, without the leaſt heſitation, any number of changes in a peal of 10 bells, which changes amounted to 3,628,800. After ſeeing as well as hearing this aſtoniſhing performance on our own inſtrument, we tried to expreſs, in muſical notation, the changes in favourite peals on eight or ten bells, but were totally unable to play them even with the notes before us, or to meet, among the greateſt performers on the harpſichord, with any one that could. The melodies produced by theſe changes are ſo wild and unlike any thing to which the hand or the eye is accuſtomed, that they are as difficult to a conſummate maſter, as the firſt tune to a child who has juſt learned the gammut. See Bells and Changes.

JEALOUSY, in *Ethics*, is that peculiar uneaſineſs which ariſes from the fear that ſome rival may rob us of the affections of one whom we greatly love, or ſuſpicion that he has already done it. The firſt ſort of jealouſy is inſeparable from love, before it is in poſſeſſion of its object; the latter is often unjuſt, generally miſchievous, always troubleſome.

Jealousy, *Waters of.* See Waters.

JEAN, St., in *Geography*, an iſland of Swiſſerland, in Bienne lake.—Alſo, a town of Canada, on the left bank of St. Laurence. N. lat. 46° 39′. W. long. 71° 33′.—Alſo, a town of Canada, on the right bank of St. Laurence. N. lat. 47° 12′. W. long. 70° 12′.

Jean *d'Angely*, *St.*, a town of France, and principal place of a diſtrict, in the department of the Lower Charente. The place contains 5400, and the canton 13,827 inhabitants, on a territory of 222½ kiliometres, in 20 communes. The chief article of trade in this place is brandy, and it has a manufacture of woollen ſtuffs. N. lat. 45° 59′. W. long. 0° 25′.

Jean *d'Aulph*, *St.*, a town of France, in the department of the Leman, and chief place of a canton, in the diſtrict of Thonon. The place contains 1918, and the canton 6344 inhabitants, on a territory of 187½ kiliometres, in 6 communes.

Jean *de Bournay*, *St.*, a town of France, in the department of the Iſére, and chief place of a canton, in the diſtrict of Vienne; 12 miles E. of Vienne. The place contains 2848, and the canton 11,733 inhabitants, on a territory of 237½ kiliometres, in 14 communes.

Jean *de Breveley*, *St.*, a town of France, in the department of Morbihan, and chief place of a canton, in the diſtrict of Ploermel. The place contains 2573, and the canton 11,337 inhabitants, on a territory of 262½ kiliometres, in 7 communes.

Jean *de Daye*, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of St. Lô. The place contains 124, and the canton 8197 inhabitants, on a territory of 132½ kiliometres, in 17 communes.

Jean *du Gard*, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Alais. The place contains 3203, and the canton 5101 inhabitants, on a territory of 87½ kiliometres, in 3 communes.

Jean *de Loſne*, a town of France, and principal place of a diſtrict, in the department of the Côte d'Or; 15 miles S.E. of Dijon. N. lat. 47° 5′. E. long. 5° 19′.

Jean *de Luz*, *St.*, a ſea-port town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the diſtrict of Bayonne, ſituated in the bay of Biſcay; the harbour of which has lately been improved; 10 miles S.W. of Bayonne. The place contains 2553, and the canton 8457 inhabitants, on a territory of 155 kiliometres, in 9 communes. N. lat. 43° 23′. W. long. 1° 35′.

Jean *de Maurienne*, *St.*, a town of France, and chief place of a diſtrict, in the department of Mont Blanc, lately capital of a county in Savoy, and the ſee of a biſhop, near the union of the rivers Arve and Aral: beſides the cathedral it has two pariſh churches and a convent; 27 miles S.E. of Chambery. The place contains 2258, and the cantons

17,453 inhabitants, on a territory of 440 kiliometres, in 20 communes. N. lat. 45° 16′. E. long. 6° 16′.

Jean *du Mont*, a town of France, in the department of the Vendée, ſituated near the ſea-coaſt; 7 miles W.S.W. of Challons.

Jean *Pied-de-Port, St.*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the diſtrict of Mauleon, having a citadel on a rock, at the entrance of one of the paſſages of the Pyrenées; 12 miles S.E. of Bayonne. The place contains 1286, and the canton 8205 inhabitants, on a territory of 417½ kiliometres, in 20 communes. N. lat. 43° 9′. W. long. 1° 10′.

Jean *en Rayans*, a town of France, in the department of the Drôme, and chief place of a canton, in the diſtrict of Valence; 18 miles E.N.E. of Valence. The place contains 2808, and the canton 6791 inhabitants, on a territory of 232½ kiliometres, in 10 communes.

Jean *de Soleymieu, St.*, a town of France, in the department of the Loire, and chief place of a canton, in the diſtrict of Montbriſon; 7 miles S. of Montbriſon. The place contains 574, and the canton 7964 inhabitants, on a territory of 180 kiliometres, in 16 communes.

Jean *de Vergt, St.*, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Perigueux. The place contains 786, and the canton 9098 inhabitants, on a territory of 277½ kiliometres, in 18 communes.

Jean *de Vertus, St.*, a town of France, in the department of the Iſére; 24 miles S.S.E. of Grenoble.

JEAN-CAPELLE, in *Ichthyology*, a name given by Ruyſch, and ſome others, to the fiſh called by authors the *faber Indicus*, or Indian doree; and more expreſſively named by Artedi the zeus with a forked tail.

JEAN-DE-BARRE, in *Geography*, an iſland of Africa, in the kingdom of Senegal, about 15 miles in circumference.

JEANNIN, Peter, in *Biography*, was born in 1540, and brought up to the profeſſion of the law. He was, at an early age, appointed advocate in the parliament of Burgundy, and ſoon diſtinguiſhed himſelf by his eloquence and force of reaſoning. He was afterwards appointed agent for the affairs of the province. In this ſituation he nobly reſiſted, with all his power, the order for perpetrating, at Dijon, the maſſacre of the Proteſtants on St. Bartholomew's day, which took place in Paris and other cities. This was particularly meritorious in him who was a moſt zealous Catholic, ſo much ſo that he joined the leaguers in ſupport of their religion; a circumſtance which proved highly ſerviceable to the kingdom; for, being deputed by the duke of Mayenne to negociate with Philip of Spain, the declared protector of the league, he ſoon diſcovered that the real deſign of that prince, in ſupporting the civil war in France, was to gain poſſeſſion of ſome of its beſt provinces. On his return, therefore, he exerted himſelf to detach the duke from the Spaniards, and to acknowledge his lawful ſovereign. Henry IV. made him a member of his council, and kept him at his court, where nothing was undertaken without his advice. He died at the age of 82, in the year 1622. This reſpectable man witneſſed the ſucceſſion of ſeven kings to the throne of France. His Memoirs and Negociations were publiſhed, in 1659, at Paris, in folio; but they have ſince been printed in four volumes 12mo. They are regarded as excellent guides for the management of important and difficult concerns. Moreri.

JEAN-RABEL, in *Geography*, a town of the iſland of Hiſpaniola, at the mouth of a river on the N.W. coaſt; 10 miles N.E. of St. Nicholas Mole. N. lat. 19° 56′. W. long. 74°.

JEATPOUR, a town of Bengal; 20 miles N. of Kiſhenagur.

JEBAKSHOUR, a town of Turkiſh Armenia; 45 miles S. of Arzengan.

JEBARA Cunaca, a town of Japan, in the iſland of Niphon; 20 miles N.N.E. of Jedo.

JEBB, Samuel, M.D., in *Biography*, a man of learning, and editor of ſeveral works, was born at Nottingham. He was entered of Peterhouſe, Cambridge, and, imbibing the ſentiments of the non-jurors, he accepted the office of librarian to Jeremy Collier. During his reſidence in college, he publiſhed a tranſlation of "Martin's Anſwers to Emelyn," 1718; and an edition of "S. Juſtini Martyris Dialogus cum Tryphone," Gr. Lat. 8vo. Lond. 1719. When he quitted Cambridge he married the daughter of an eminent apothecary in London, who gave him inſtructions in pharmacy. Still, however, he continued his literary purſuits; and in 1722 undertook the editorſhip of a periodical work, entitled "Bibliotheca Literaria," which only extended to 10 numbers, notwithſtanding it was ſupported by the contributions of ſeveral diſtinguiſhed ſcholars. He likewiſe edited the following works: "De Vita et Rebus geſtis Mariæ Scotorum Reginæ," 8vo. 1725, which was compiled from original records and authors of credit; "Ariſtidis Orationes, cum Notis," in two volumes 4to. Oxford, 1728, which is a valuable edition of this Greek orator; "Joannis Caii Britanni de Canibus Britannicis, de variorum Animalium et Stirpium, &c. de Libris propriis, de Pronunciatione Græcæ et Latinæ Linguæ," 8vo. 1729; "Baconi Opus Majus," folio, 1733; "Hodii Lib. ii. de Græcis illuſtribus, &c." 8vo. 1742; to which he prefixed a Latin diſſertation on the life and writings of the author. It is not known at what period Mr. Jebb received the degree of M.D. He ſettled at Stratford, in Eſſex, and continued to practice medicine there till late in life, when he retired, with a moderate fortune, into Derbyſhire, where he died in 1772. Gen. Biog. Nichols's Anecdotes of Bowyer.

Jebb, *Sir* Richard, Baronet, M.D. was born at Stratford, in Eſſex, where his father, the ſubject of the preceding article, practiſed as a phyſician. He had a liberal claſſical education at Oxford; but being by principle a non-juror, from his father, he could not be matriculated, nor take any degree at that univerſity. He afterwards ſtudied medicine in London and in Leyden; and from the univerſity in the latter city he obtained the degree of doctor of medicine. Upon ſettling in London he entered as licentiate of the College of Phyſicians; and in the year 1768 he was elected a fellow of that body. He was for ſome time phyſician both to St. George's hoſpital, and to the Weſtminſter infirmary. As a practitioner he became ſo eminent, that when the duke of Glouceſter fell dangerouſly ill in Italy he was requeſted to go abroad to attend the health of that prince; and on this occaſion his conduct gave ſo much ſatisfaction that he was called abroad a ſecond time to viſit the ſame prince, on a future illneſs, in 1777. About this time he was made phyſician-extraordinary to the king; and in 1780 was appointed phyſician in ordinary to the Prince of Wales. He not only held theſe offices about the royal family, but was for ſeveral years one of the phyſicians chiefly employed by them. Upon the death of ſir Edward Wilmot, in 1768, he was appointed one of the phyſicians in ordinary to his majeſty; but this office he did not enjoy many months; for, being in attendance on two of the princeſſes, who were affected with the meaſles, he was ſuddenly attacked with a fever in their apartments at Windſor, and fell a victim to the diſeaſe, after a few days illneſs, on the 4th day of July, 1787, in the 58th year of his age.

Jebb, John, an eminent ſcholar, divine, and phyſician, was the eldeſt ſon of the Rev. John Jebb, dean of Caſhell, ſprung from a family in Nottinghamſhire; and was born at London in the year 1736. Having finiſhed his early education at ſeveral ſchools in England and Ireland, he was admitted a penſioner of Trinity-college, Dublin, in 1753, and in the following year entered at St. Peter's college, Cambridge, where, in 1757, he took the degree of B.A., and commenced the office of private tutor. In 1760 he proceeded to the degree of M.A. and was confirmed fellow. In 1762 he received deacon's orders, and in the following year thoſe of prieſt. He was elected by the univerſity to the rectory of Ovington, in Norfolk, in 1764, and in the ſame year married Ann, daughter of the Rev. J. Torkington and of lady Dorothy Sherrard, with whom he lived in happy union of ſentiment and affection to the time of his death. In 1765 he publiſhed, in conjunction with two friends, *viz.* the Rev. Robert Thorpe and the Rev. George Wollaſton, a work held in high eſtimation at Cambridge and elſewhere, and entitled "Excerpta quædam é Newtoni Principiis Philoſophiæ Naturalis, cum notis Variorum," 4to. On the return of our author to Cambridge in 1766, he commenced an important era of his life. Reſuming his office as private tutor, and reading occaſional lectures, he entered with ardour into the concerns of the univerſity. In 1768 he began a courſe of lectures on the Greek Teſtament, in the proſecution of which he avowed opinions of a very liberal kind; and in his political ſentiments he ranked himſelf among the advocates for popular meaſures. In both theſe reſpects he became the undiſguiſed and zealous advocate of reformation both in church and ſtate. Having in 1769 been preſented to the vicarage of Flixton, near Bungay, and to the united rectories of Homersfield and St. Croſs, and being alſo nominated chaplain to his wife's relation, the earl of Harborough, he from this time divided his reſidence for ſome years between Bungay and Cambridge. In 1770 he publiſhed a "Short Account" of his theological lectures, which had ſubjected him to ſome obloquy, and in 1772 he re-edited this "Account" with large additions. About this time he took an active part with thoſe who ſought relief in the matter of eccleſiaſtical ſubſcription, and appeared as an advocate of the cauſe in the Whitehall Evening Poſt, under the aſſumed appellation of "Paulinus." His letters were collected in a pamphlet, publiſhed in 1772. He was alſo anxious for the improvement of academical education in Cambridge; with a view to which he wiſhed to eſtabliſh annual examinations. But all his liberal efforts and plans proved ineffectual with regard to their main object, although it has been thought that they were not altogether fruitleſs as to their general influence on the ſtate of the univerſity. Soon after this time, Mr. Jebb, actuated by an integrity and zeal which did him great honour, determined to withdraw from the public ſervice of a church, the eſtabliſhed doctrines of which he diſapproved; and accordingly in September 1775, he reſigned all his livings, and in September 1776, he finally left Cambridge. He was now entering anew, as it were, into life; and with a view to an honourable and uſeful mode of exerciſing his talents, and of procuring a ſubſiſtence, he determined, under the advice of his relation ſir Richard Jebb, to aſſume the medical profeſſion. The neceſſary qualifications it would not require much time to attain, when we conſider the comprehenſive mind and the indefatigable aſſiduity of Mr. Jebb; and therefore after devoting his attention for ſome time to the ſtudies connected with the profeſſion which he had in view, he obtained in 1777 a diploma of M.D. from St. Andrews, and was admitted a licentiate of the London college, and commenced practice in February 1778, purſuing at the ſame time various means of medical improvement. In this year he was elected a fellow of the Royal Society. In his political career he connected himſelf with thoſe who were adverſe to the American war; and as he was always ardent in every cauſe which he deemed of importance, his zeal on this occaſion obſtructed his profeſſional ſucceſs, though he had many friends who thought highly of his talents, and who much wiſhed to ſerve him. Of his attention to the duties of his profeſſion he gave evidence to the public in 1782 by a work entitled "Select Caſes of the Diſorder commonly termed the Paralyſis of the Lower Extremities; to which is added A Caſe of Catalepſy." Theſe caſes tend to ſupport the practice of Mr. Pott in applying cauſtics to the tumour of the ſpine in the above-mentioned paralyſis. The ardour of Dr. Jebb's mind, the aſſiduity of his application, the various anxieties he felt for the intereſts of the public, and the fatigues which he underwent in his endeavours to promote them, impaired his bodily health and ſtrength, and reduced him to a ſtate of debility, under the progreſs of which he ſunk, whilſt he retained the full exerciſe of his faculties and benevolent feelings; ſo that he terminated a courſe of honourable and active ſervice on March 2, 1786, in the 51ſt year of his age. His works conſiſt of his "Plan of Theological Lectures;" "A Harmony of the Goſpels;" letters on the ſubject of ſubſcription; ſermons and theological tracts; papers relative to the ſtate of public education at Cambridge; of medical caſes; and of political and miſcellaneous papers. They were collected and publiſhed in three large volumes 8vo. in 1787 by Dr. John Diſney, who has prefixed memoirs of his life, to which we are indebted for the preceding article.

JEBHAN, in *Geography*, a town of Hindooſtan, in Lahore; 55 miles N.N.E. of Behnbur.

JEBINIANA, a town of Tunis; 15 miles S.E. of El Jemme.

JEBNA, a town of Paleſtine, on the ſcite of the ancient city of Gath, afterwards called "Ibelin;" 10 miles S. of Jaffa.

JEBUGY, a town on the S. coaſt of Mindanao. N. lat. 7° 15′. E. long. 122° 55′.

JEBUS, in *Ancient Geography*, an ancient name of Jeruſalem; before it was conquered by the Iſraelites. It was ſo called from its founder Jebus, ſon of Canaan, and father of the Jebuſites. Joſh. xviii. 28. Judg. xix. 11.

JECARINUS Piscis, in *Ichthyology*, a name given by Gaza, and many other writers, to the fiſh more commonly called *hepatus piſcis*, by ſome *jecur marinum*.

JECTEHEL, in *Ancient Geography*, a name given to Petra, the capital of Arabia Petræa; ſaid to have been derived from the name of a rock, from the ſummit of which Amaziah, king of Judah, precipitated 2000 Idumæans whom he had taken in battle.

JECUR. See Liver.

Jecur *marinum*, in *Ichthyology*, is uſed by Hermolaus and ſome other writers in the ſame ſenſe with hepatus.

Jecur *uterinum*. The placenta is by ſome thus called, from the ſuppoſed ſimilitude of its figure and office with that of the liver.

JEDBURGH, anciently called *Jedworth*, in *Geography*, a royal borough, and capital town of the county of Roxburgh in Scotland, is pleaſantly ſituated on the banks of the river Jed, and is nearly ſurrounded with lofty eminences. The town lays claim to remote antiquity. The two Jedburghs, or Jedworths, according to Chalmers, are the oldeſt pariſhes in Scotland. As early as the middle of the ninth century, biſhop Ecgred founded a church and village on the banks of the Jed, at or near this place. At the commencement of the Scoto-Saxon period a caſtle was ſtanding here, and the village was advanced to the dignity of a burgh, under the influence of the baron. Malcolm IV. is ſaid to have reſided very frequently at this caſtle, and finiſhed his youthful career at this place in the year 1165. In ſeveral charters granted by this monarch, by William and Alexander II., Jedburgh is called "Our Burgh." Other monarchs, and nobles of the firſt rank, made the caſtle of Jedburgh a place of reſidence, and many public acts were executed here; and after the demiſe of Alexander III. the town, monaſtery, and caſtle were involved, for ſeveral ages, in bloodſhed and devaſtation. Hamilton, an amiable poet, thus laments the effects of wars, on

——— "Jedas ancient walls, once ſeat of kings."

In 1147, David I. founded a monaſtery for canons regular at this place, and provided it with ample revenues ariſing from tithes, "the multure of the miln of Jedworth," and a ſaltwork. Malcolm IV. augmented theſe revenues. The biſhop of Glaſgow, and the abbot of Jedburgh, had many altercations reſpecting their dignities, liberties, cuſtoms, rents, &c. and at length the former obtained a decided aſcendency over the latter. The wars between the Scots, and king Edward I. of England, involved the abbot and his canons in ruin. They were driven from their monaſtery, and ſought refuge in different religious houſes in England. At the Reformation, the monaſtery became the property of the king by annexation. A convent of Carmelites was founded here in 1513. Beſides the town of Jedburgh, the pariſh comprehends a large diſtrict, which is divided into three parts by the intervention of the pariſhes of Abbot-rule and Oxnam. The lower diviſion, on both ſides of the river, forms the principal part of the pariſh; the ſecond contains the diſtrict of old Jedburgh; and the third, or upper part, laying on the eaſt ſide of the river, and extending to the border mountains, conſtitutes the barony of Edgarſtown. Beſides the eſtabliſhed church, the town contains three other places of worſhip; reſpectively called the Burger-meeting, anti-Burger-meeting, and Relief congregation. Jedburgh is governed by a provoſt and three bailies, aſſiſted by a ſelect council of the principal inhabitants. Here are a weekly market, and ſeveral fairs. The vicinity of the town is noted for its orchards. In 1800 the number of houſes was 676, and of inhabitants 3834. Chalmers Caledonia, vol. ii. —Sinclair's Statiſtical Account of Scotland, vol. i.

JEDNITZA, a town of Hungary, on the borders of Moravia; 30 miles N. of Topoltzau.

JEDO, Jeddo, or *Yeddo*, the capital of Japan, centrically ſituated on a bay of the ſame name, on the S.E. ſide of the chief iſland Niphon. The houſes never exceed two ſtories, and have numerous ſhops towards the ſtreets. The harbour is ſo ſhallow, that an European ſhip would be obliged to anchor at the diſtance of five leagues. The city towards the bay forms the figure of a creſcent, and is of ſuch extent, as the Japaneſe affirm, that it would occupy a perſon 21 hours to walk round its circumference, which might thus amount to 21 leagues: and they ſay, that it is ſeven leagues in length by five in breadth. Thunberg obſerves, that it is ſaid to be 63 Britiſh miles in circumference, and at any rate rivals Pekin in ſize. A large river, not named by Kæmpfer, but by others called Tonkag, paſſes through the city, and diſcharges itſelf into the haven by five ſtreams, over each of which is a bridge: a conſiderable branch ſurrounds the caſtle, and fills its ditches, over which is the principal bridge, called Niphonbas, which is the centre whence roads and diſtances are meaſured. Theſe ſtreams ſupply ſeveral canals. The bridge now mentioned opens on both ſides into a long ſtreet, 50 paces wide, that traverſes the whole city, and that is thronged with paſſengers, many of whom are richly dreſſed, and carried in their chairs and palanquins. This city has ſuffered much from repeated earthquakes, and alſo from a fire, which, in 1772. is ſaid to have conſumed ſix leagues of it in length, and three in breadth. Since theſe calamities have occurred the buildings have been improved, the ſtreets have been widened and made to croſs one another at right angles, and ſeveral palaces, temples, monaſteries, and public edifices have been erected in a more beautiful ſtyle. The moſt ſuperb ſtructure is the emperor's palace, which is ſurrounded with ſtone walls and ditches with draw bridges, forming of itſelf a conſiderable town, which is ſaid to be five leagues in circumference. It conſiſts of three incloſures, the innermoſt of which is the reſidence of the emperor, and behind it are magnificent gardens, and the other two are occupied by the princes and lords that compoſe his court. The police of the town is under the conduct of two governors, who act alternately for a year; and beſides, there are ſeveral ſubordinate magiſtrates who ſuperintend the ſtreets, the tradeſmen, handicrafts, &c. who are very numerous, and of various deſcriptions. Like other Japaneſe cities, Jedo has neither walls nor fortifications; but it includes a great number of ſhops and markets, furniſhed with all ſorts of neceſſaries and merchandize, which are ſold at a higher price than in any other city of the empire, on account of the population of the place, and the difficulty of importation. N. lat. 36° 30'. E. long. 140°.

JEDOGAWA, a river of Japan, which paſſes by Oſaka, where it is croſſed with ſeveral bridges of cedar, from 300 to 360 feet in length.

JEDOWITZ, a town of Moravia, in the circle of Brunn; 10 miles N.N.E. of Brunn.

JEEAGUR, a town of Bengal; 43 miles S.S.E. of Curruckpour.

JEEMBAREE, a town of Bengal; 12 miles N.N.W. of Koonda.

JEEMWOREE, a town of Hindooſtan, in Oude; 40 miles E. of Fyzabad.

JEER-Capstan, in *Nautical Language*. See Capstan.

JEERS, or Jears, in a *Ship*, an aſſemblage of tackles, by which the lower yards of a ſhip are hoiſted up along the maſt to their uſual ſtation, or lowered from thence as occaſion requires; the former of which operations is called *ſwaying*; and the latter *ſtriking*.

In a ſhip of war the jeers are uſually compoſed of two ſtrong tackles, each of which has two blocks, *viz.* one faſtened to the lower maſt-head, and the other to the middle of the yard. The two blocks which are laſhed to the middle, or ſlings of the yard, are retained in this ſituation by means of two cleats, nailed on each ſide, whoſe arms incloſe the ropes by which the blocks are faſtened to the yard. The two ropes which communicate with theſe tackles lead down to the deck on the oppoſite ſide of the maſt, according to the ſituation of the upper jeer-blocks. The jeers in merchant-ſhips have uſually two large ſingle blocks on the oppoſite ſide of the maſt-head, and another of the ſame ſize in the middle of the yard. The rope, which communicates with theſe, paſſes through one of the blocks hanging at the maſt-head, then through the block on the yard, and afterwards through the other hanging-block upon the maſt. To the lower ends of this rope, on the oppoſite ſides of the maſt, are fixed two tackles, each of which is formed of two double blocks, the lower one being hooked to a ring-bolt in the deck, and the upper one ſpliced or ſeized into the lower end of the great rope above, which is called the tye. By this contrivance the mechanical power of the tackle below is tranſmitted to the tye, which, communicating with blocks on the yard, readily ſways up or lowers it, either by the effort of both jeers at once, on the oppoſite ſides of the maſt, or by each of them ſeparately one after another. Falconer.

They ſay a man is brought to the jeers, when going to be puniſhed at the jeer-capſtan. This is done in the following manner; a capſtan-bar being thruſt through the hole of the barrel, the offender's arms are extended at full length croſs-wiſe, and ſo tied to the bar; having ſometimes a baſket of bullets, or ſome other like weight, hanging by his neck. In this poſture he continues till he be either brought to confeſs ſome plot or crime, whereof he is ſuſpected; or that he has ſuffered what he is cenſured to undergo, at the diſcretion of the captain.

JEETKA, in *Geography*, a town of Bengal; 28 miles N.N.W. of Dacca.

JEFFERIES, George, in *Biography*, an Engliſh judge, whoſe name has already been mentioned in ſome foregoing articles with becoming indignation, was born at Acton in Denbighſhire, and educated at Weſtminſter ſchool, after which he removed to the Inner Temple, where he ſtudied the law with great application. By attaching himſelf to the duke of York (ſee James II.) he obtained the place of a Welch judge, the honour of knighthood, and the chief-juſticeſhip of Cheſter. In 1683 he was appointed chief-juſtice of the king's bench, and in 1685 lord chancellor. His cruelties on the weſtern circuit upon the followers of the duke of Monmouth were of the moſt ſavage kind: they were, however, quite ſatisfactory to the king, who merrily (a wretched ſubject for royal merriment) denominated this particular circuit "Jefferies's campaign." By ſupporting all the arbitrary meaſures of the court, he rendered himſelf ſo obnoxious to the people, that when James abdicated the throne and fled from the kingdom, he would gladly have followed his maſter, but being detected in the diſguiſe of a ſailor, he was ſeized, and would have been torn to pieces by the people, had he not been reſcued by the civil power: he was afterwards committed to the Tower, where he died in 1689. Hume's Hiſt.

JEFFERSON, in *Geography*, a county of Kentucky, in America, bounded N. and W. by Ohio river, S. by Nelſon county, and S.E. and E. by Shelby; it contains 8395 inhabitants, of whom 2330 are ſlaves. The chief town is Louiſville.—Alſo, a county of Georgia, formed in 1796 from the counties of Burke and Warren, bordering on Ogechee river, and Briar and Big creeks. It contains 5684 inhabitants.—Alſo, a county in Teneſſee, Hamilton diſtrict, watered by ſeveral rivers, and containing, together with the county of Cocke, 9017 inhabitants, of whom 695 are ſlaves.—Alſo, a county of the ſtate of Ohio, bounded S. by the Ohio, and N. by the lake Erie, including the tract called the Connecticut reſerve; and containing 8766 inhabitants. Its chief town is Stubenville.—Alſo, a poſt-town of Virginia, on the N. ſide of Roanoke river, 19 miles below the Oeconeachey iſlands. N. lat. 36° 32'.—Alſo, a town in Grafton county, North Hampſhire, containing 112 inhabitants.—Alſo, a town of Pennſylvania, nine miles from Amity, and ſeven from Scottville.—Alſo, a fort in the ſtate of Ohio, ſituated on a ſmall ſtream, which falls into the Great Miami, containing about 100 men; 21 miles N. of fort St. Clair. N. lat. 40° 4'.—Alſo, a fort on the E. bank of the Miſſiſippi, in Kentucky, near the line of the ſtate of Teneſſee.

JEFFERY, Thomas, in *Biography*, ſon of a reſpectable merchant, was born at Exeter towards the cloſe of the ſeventeenth century. He received his academical education in the ſeminary under the care of Mr. Joſeph Hallet; in connection with whom he afterwards, for ſome time, preached. In the year 1726 he ſettled at Little Baddow, in Eſſex, where he remained but two years, when he returned to his native city. He had already exhibited talents which led his friends to expect much from his future labours, but Death, who pays no regard to ſuperior abilities, took him away while he was ſtill a very young man. His publications, which were chiefly in defence of our common religion, met with the approbation of the wiſe and the learned, and even extorted high encomiums from his principal antagoniſt Mr. Anthony Collins. His principal pieces are entitled "The true Grounds and Reaſons of the Chriſtian Religion, in oppoſition to the falſe Ones, &c.;" "Chriſtianity the Perfection of all Religion, Natural and Revealed, &c." Mr. Jeffery poſſeſſed a ſtrong intellect; he devoted himſelf to the inveſtigation of the ſcriptures: ſo abſorbed was he in application and thought, that he would go a whole day without his uſual meals, and without recollecting that abſtinence to which were owing the languor and exhauſted ſpirits which he felt in the evening. He had an expanded, liberal, and candid mind. Dr. Kennicott highly applauded Mr. Jeffery's anſwers to Collins; and Dr. Doddridge ſpeaks of the writer as having treated the ſubject of prophecy, and the application of it in the New Teſtament, more ſtudiouſly, perhaps, than any one ſince the time when Euſebius wrote his "Demonſtratio Evangelica." Monthly Mag.

Jeffery, in *Geography*, a town of North Carolina; 40 miles W.S.W. of Halifax.

Jeffery's *Creek*, a river of South Carolina, which runs into the Great Pedee. N. lat. 34° 8'. W. long. 79° 29'.

JEFFERYS, George, in *Biography*, was born at Weldron, in Northamptonſhire, and educated at Weſtminſter ſchool, and Trinity college, Cambridge, where he obtained a fellowſhip. He afterwards ſtudied the law as his future profeſſion, but never practiſed in it. He died in 1755, at the age of 77: he had in the preceding year publiſhed his works in a collective form in one volume quarto, containing miſcellanies in proſe and verſe, and among other pieces, the tragedies of Edwin and Merope.

JEFFREY'S Lodge, in *Geography*, a ſand-bank on the coaſt of Maſſachuſetts, between cape Ann and Caſco bay, extending from the N.W. to the S.E.; between 42° 40' and 47° 37' 30" N. lat. and between 68° 52' 30" and 69° 45' W. long.

JEGENOE, a ſmall iſland of Denmark, in Lymford gulf, containing two villages. N. lat. 56° 39'. E. long. 8° 38'.

JEGNI-BASAR, a town of Aſiatic Turkey, in Natolia; 28 miles N. of Mogla. N. lat. 37° 35'. E. long. 28° 12'.

JEGNICAN, a town of European Turkey, in Bulgaria; 12 miles E.S.E. of Sophia.

JEGNI-KEVI, a town of Aſiatic Turkey, in Natolia; 24 miles N.N.W. of Degnizlu.—Alſo, a town of European Turkey, in Romania; 44 miles W.S.W. of Burgas.

JEGNIPANGOLA, a town of European Turkey, in Bulgaria; 70 miles E.S.E. of Driſtra.

JEGNISHEHR, a town of Aſiatic Turkey, in Natolia; 15 miles S. of Iſnik.

Jegnishehr, or *Janichere*, a town of Aſiatic Turkey, in Natolia, ſituated near ruins, ſuppoſed to be thoſe of Antioch on the Meander; 28 miles W. of Degnizlu.

JEGUN, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Auch; 13 miles E. of Condom. N. lat. 43° 45'. E. long. 0° 32'.

The place contains 2050, and the canton 7978 inhabitants, a territory of 215 kiliometres, in 16 communes.

JEHAGH. See GIAGH.

JEHANABAD, in *Geography*, a town of Hindooſtan, in Bahar. N. lat. 25° 3′. E. long. 83° 58′.

JEHAOUL, a town of Hindooſtan, in Moultan; 15 miles W.N.W of Adjodin.

JEHENABAD, a town of Hindooſtan, in Bahar; 20 miles S.S.W. of Patna. N. lat. 25° 12′. E. long. 15° 11′.

JEHOVAH, in *Theology*, one of the ſcripture names of God; ſignifying the Being who is ſelf-exiſtent, and who gives exiſtence to others. (See GOD.) When God declared to Moſes, that he had not made known his name Jehovah, he does not mean that they were ignorant of him, as God the creator, ſelf-exiſting; but that he had not revealed this name, which ſo well expreſſes his nature, and by which he would be invoked afterwards.

So great a veneration had the Jews for this name, that after the Babyloniſh captivity they left off the cuſtom of pronouncing it; whereby its true pronunciation was forgotten. They call it *tetragrammaton*, or the name with four letters; and believe that whoever knows the true pronunciation of it, cannot fail to be heard by God. Simon the Juſt, they ſay, was the laſt who was acquainted with it. The author of the Talmud denounces terrible curſes againſt thoſe who pronounce it; they ſcruple even trying to do it; and pretend that the angels have not this liberty. But it would be endleſs, and no leſs unprofitable, to recite the various whims and fancies which the Jews, the Cabbaliſts, and the Mahometans have indulged with regard to this name, and that of Allah, correſponding to it among the latter. See ADONAI.

JEJUARA, in *Geography*, a town of Hindooſtan, in Bahar; 18 miles N.W. of Durbungah. N. lat. 26° 19′. E. long. 85° 50′.

JEJUNE STYLE. See STYLE.

JEJUNUM, the ſecond of the ſmall guts; thus called from the Latin *jejunus*, *hungry*; becauſe always found empty. See INTESTINES.

JEJURRY, in *Geography*, a town of Hindooſtan, in the country of Viſiapour; 12 miles E. of Poorundar.

JEJURY, a town in the Eaſt Indies, near which is an elegant temple, of conſiderable celebrity among the Hindoos. It is thus deſcribed by major Moor in his Hindoo Pantheon. "A handſome temple, dedicated to the worſhip of an avatara of Siva under the name of Kandeh Rao, (ſee KANDEH RAO,) is at Jejury, a town of ſome extent, about thirty miles to the S.E. of Poona. I have viſited this temple. It is ſituated in a beautiful country, on a high unconnected hill, and has a very commanding and majeſtic appearance: the temple, ſurrounding walls, and ſteps up to it, are well built of fine ſtone. I have had occaſion to remark, and it has alſo doubtleſs been remarked by others, that the ſcite of churches built by the Jeſuits are always on the moſt healthy, beautiful, and pictureſque points, evincing the judgment and taſte of that wonderful order of men: the ſame may, I think, be obſerved of Hindoo temples; generally, after allowing for the neceſſary proximity of water, the moſt beautiful the neighbourhood affords.

"The obtruſive importunity of the beggars prevented me from examining this fine temple at Jejury ſo fully as I wiſhed; indeed, from their officiouſneſs I could ſcarcely examine it at all. The Brahmans informed me, on ſubſequent enquiries, that a ſtone is there, about two feet ſquare, on which are two Lingas (ſee LINGA), one larger than the other, whence Kandeh Rao, and I ſuppoſe Malſara, his conſort, (ſee MALSARA,) ſprang: there are alſo two images of him, one of gold, one of ſilver, and one of ſilver of Malſara; all richly ornamented on great days, when they are mounted on horſeback or on elephants. If, however, there really be ſuch maſſive images in metal, they could ſcarcely be carried by a horſe. Images of lighter materials are, I apprehend, ſubſtituted; or, metallic heads are embodied, armed and arrayed with clothes; and thus carried about or exhibited. I have ſeveral of theſe hollow heads, to which bodies, &c. could eaſily be appended: I have alſo ſeveral braſs maſks, ſome as large as a man's face, that may anſwer, and, peradventure, may have anſwered on ſimilar occaſions.

"Jejury temple is very rich: it is ſaid to expend half a lak'h (50,000) rupees, about 6000*l.* ſterling, yearly in the expences and eſtabliſhment for Kandeh Rao; horſes and elephants are kept for him: he and his ſpouſe are bathed in Ganges water, and roſe water, perfumed with *atr*, and decorated with gems. The revenues, like thoſe of moſt other temples, are derived from houſes and lands given by pious people, and from preſents and offerings conſtantly making by all deſcriptions of votaries and viſitors, according to their means, or to their faith, hope, or charity. At the annual jatra, or fair, which commences on the laſt day of the dark half of the lunar month Chaitra (in January) a lak'h (100,000) or more perſons viſit Jejury. It is cuſtomary to ſacrifice a ſheep; and the Brahmans aſſured me, that twenty, or, in particular years, thirty thouſand are ſlain on this occaſion, and to the honour and glory of Kandeh Rao."

In another work the ſame author more particularly deſcribes Jejury as a pretty large town, but, with the exception of a few ſhopkeepers and retailers of fruit, vegetables, and ſuch ſmall wares, apparently wholly inhabited by Brahmans and beggars, the latter of whom were exceedingly importunate and troubleſome. Were it not for its temple, the town is not deſerving particular notice. The aſcent to the temple is on the north-eaſtern ſide, by a handſome flight of broad ſtone ſteps, and being of conſiderable height, and rather ſteep, the walk up is ſomewhat fatiguing: arches are in many places thrown acroſs over the ſtairs, which have, on each ſide, frequent buildings of ſtone of a pyramidal form for lights; others have the appearance of receſſes. The inner temple, where the deity is placed, is ancient and not very handſome; but the encloſure is elegant and extenſive, beautifully finiſhed with fine ſtone, and the pavement is alſo of large flags. The encloſure is open, and commands a fine view of the ſurrounding country. There is a very large bank, elegantly built with fine ſtone, a little to the ſouthward of the hill on which the temple ſtands, which is about two miles from a range of hills that runs in a ſouth-eaſterly direction.

In this temple are kept many beautiful young women as ſingers and dancers: from the account received by major Moor on the ſpot, there were more than two hundred at the time of his viſit (1792); ſuch as he ſaw were very handſome. They are here called *Murty*; which ſee.

JEKIMABAD, a town of Perſia, in the province of Segeſtan; 60 miles E.N.E. of Boſt.

JEKISINOKORI, a town of Japan, in the iſland of Niphon; 65 miles N.N.E. of Meaco.

JEKYL, *Sir* JOSEPH, in *Biography*, an Engliſh lawyer, was born in Northamptonſhire in 1663. Little is known of him in early life, but he diſtinguiſhed himſelf in the reign of William III. by a ſteady attachment to the Whigs. He was appointed one of the managers on the trial of Dr. Sacheverel, and on the acceſſion of George I. he was knighted, made maſter of the Rolls, and a privy counſellor. He ſucceſsfully maintained the independence of his office againſt the lord chancellor King, in a pamphlet, entitled "The Judicial Authority of the Maſter of the Rolls ſtated and vindicated." Sir Joſeph was an excellent patriot, a kind and benevolent man: when it was propoſed to ſubſidize foreign mercenaries, he contended that the practice was repugnant to the maxims by which England, in former times, had ſteered and ſquared her conduct with relation to her intereſt abroad; that the navy was the natural ſtrength of Great Britain; its beſt defence and ſecurity: but if, in order to avoid a war, they ſhould be ſo free-hearted as to buy and maintain the forces of foreign princes, they were never like to ſee an end to ſuch extravagant expences. On another occaſion, when it was propoſed by his own friends to proſecute the duke of Ormond for high treaſon, ſir Joſeph ſaid, if there were room for mercy he hoped it would be ſhewn to that noble, generous, and courageous peer, who had in the courſe of ſo many years exerted his talents for the good and honour of his country. He died in the year 1738. His brother, doctor Thomas Jekyl, was educated at Trinity college, Cambridge; became vicar of Rowd in Wiltſhire, lecturer at Newland in Glouceſterſhire, and miniſter of St. Margaret's-chapel, Weſtminſter. He was author of ſeveral ſermons and tracts; and of an "Expoſition of the Church Cathechiſm." Smollett's Continuation.

JEKYL *Iſland*, in *Geography*, a ſmall iſland in the Atlantic, near the coaſt of Georgia, at the mouth of the Alatamaha. N. lat. 31° 7′. W. long. 81° 40′. It is ſaid, that the ſound at the mouth of this river will afford ſafe riding for a dozen ſhips of 40 guns.

JELALABAD, a town of Hindooſtan, in Oude; 18 miles S.E. of Azimgur.—Alſo, a town in Oude; eight miles S. of Lucknow.—Alſo, a town in Rohilcund; 42 miles S. of Bereilly.

JELALPOUR, a town of Hindooſtan, in Oude; 17 miles N.N.E. of Raat.

JELATGUR, a town of Bengal; eight miles N. of Purneah.

JELAUL, a town of Hindooſtan, in Lahore; 15 miles N.W. of Rotas.

JELENGHIAN, a town of Curdiſtan; 60 miles S.E. of Van.

JELENY, a town of Bohemia; 14 miles S.E. of Koniginggratz.

JELGOVAN, a town of Hindooſtan, in Bahar; 17 miles N.N.E. of Bahar.

JELINA, a town of Lithuania; 15 miles S.E. of Lida.

JELIOTTE, in *Biography*, a French vocal performer of great talents and public favour at Paris, which continued undiminiſhed to the end of his life.

He was a native of Berne, of a very good family of that province, and not intended for the profeſſion which he embraced, and which, luckily for the public, his early youth made him prefer to that which would have been more agreeable to his parents, and more befitting their rank in life.

No ſinger was ever gifted with a finer voice, or knew better how to uſe it, nor was a better muſician than Jeliotte. Though he had been dead 25 years when this article was written, (1780,) the charms of his voice, his taſte, and his action were not forgotten, nor the tranſports by which the public expreſſed their gratitude, whenever he appeared on the ſtage.

No one was ever ſo happy in a great number of friends, or ever better deſerved them than Jeliotte. His natural wit, ornamented and poliſhed by his knowledge of the world, and his agreeable perſonal qualities, made him always ſought, for his own ſake, as much as for the diverſity and charms of his talents. Laborde.

JELLA, in *Geography*, a town of Birmah, on the Ava; 10 miles S. of Lundſey.

JELLALÆAN, or GELALÆAN *calendar*, *epocha*, and *year*. See CALENDAR, EPOCHA, and YEAR.

JELLANTRA, in *Geography*, a town of Hindooſtan, in the circar of Cicacole; 36 miles S.W. of Ganjam.

JELLASORE, a town of Bengal; 80 miles S.S.W. of Calcutta. N. lat. 21° 56′. E. long. 87° 16′.

JELLASSAR, a town of the province of Agra, on the borders of Dooab; 99 miles S.E. of Delhi. N. lat. 27° 25′. E. long. 78° 44′.

JELLING, a town of Denmark, in North Jutland, formerly a city and the reſidence of kings; 14 miles N. of Colding.

JELLINGHY, a town of Hindooſtan, in Bengal, on the right ſide of the Ganges; 90 miles N. of Calcutta. N. lat. 24° 6′. E. long. 88° 48′.—Alſo, a river which is a branch of the Ganges, that ſeparates from the main ſtream near Jellinghy, and after being joined by another branch about 50 miles N. of Calcutta, forms the Hoogly.

JELLOUD, a town of Hindooſtan, in Oude; 10 miles S.S.E. of Fyzabad.

JELLOULAH, a town of Africa, in Tunis; 10 miles N.W. of Cairoan.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper conſiſtence with ſugar, or of the ſtrong decoctions of the horns, bones, or extremities of animals, boiled to ſuch a height as to be ſtiff and firm when cold, without the addition of any ſugar. See *Harts*' HORN.

The jellies of fruits are cooling, ſaponaceous, and aceſcent, and therefore are good as medicines in all diſorders of the primæ viæ, ariſing from alcaleſcent juices, eſpecially when not given alone, but diluted with water. On the contrary, the jellies made from animal ſubſtances are all alcaleſcent, and are therefore good in all caſes in which an acidity of the humours prevails: the alcaleſcent quality of theſe is however in a great meaſure taken off, by the adding lemon juice and ſugar to them. There were formerly a ſort of jellies much in uſe, called *compound* jellies; theſe had the reſtorative medicinal drugs added to them, but they are now ſcarcely ever heard of.

The jelly obtained from the various parts of animals contains a mucous ſubſtance, very ſoluble in water, but not in alcohol; and it may be eaſily obtained by boiling theſe animal ſubſtances in water, and concentrating the decoction, until, by mere cooling, it aſſumes the form of a ſolid tremulous maſs. The jelly of harts-horn is extracted by a ſimilar operation, and afterwards rendered white with the milk of almonds. This kind of food, duly ſcented, is ſerved up at our tables by the name of "blanc-mangè." Jellies are in general reſtorative and nouriſhing; that of harts-horn is aſtringent and emollient. Jellies in general have, in their natural ſtate, no ſmell, and their taſte is inſipid. By diſtillation they afford an inſipid and inodorous phlegm, which eaſily putrefies. A ſtronger heat cauſes them to ſwell up, become black, and emit a fœtid odour, accompanied with white acrid fumes. An alkaline phlegm then paſſes over, ſucceeded by an empyreumatic oil, and a little carbonate of ammonia. A ſpongy coal remains, which is with difficulty reduced to aſhes, and affords by analyſis muriate of ſoda and phoſphate of lime. Water diſſolves jellies perfectly; hot water diſſolves a large quantity, as they become conſiſtent only by cooling. Acids and alkalies alſo diſſolve them. The nitric acid diſengages, as M. Berthollet has ſhewn, nitrogen gas. For other properties, ſee GELATIN.

If jelly be concentrated to ſuch a degree as to give it the form of a cake, it is deprived of the property of putrefying; and thus the dry or portable ſoups are formed, which may be of the greateſt advantage in long voyages. The following is a receipt given by M. Chaptal for preparing theſe cakes: calves feet, 4; leg of beef, 12lbs.; knuckle of veal, 3lbs.; leg of mutton, 10lbs. Let theſe be boiled in a ſufficient quantity of water, and the ſcum taken off as uſual; after which the ſoup is to be ſeparated from the meat by ſtraining and preſſure. The meat is then to be boiled a ſecond time in other water; and the two decoctions, being added together, muſt be left to cool, in order that the fat may be exactly ſeparated. The ſoup muſt then be clarified with five or ſix whites of eggs, and a ſufficient quantity of common ſalt be added. The liquor is then ſtrained through flannel, and evaporated in the water, both to the conſiſtence of a very thick paſte; after which it is ſpread rather thin upon a ſmooth ſtone, then cut into cakes, and laſtly, dried in a ſtove until it becomes brittle; theſe cakes are kept in well-cloſed bottles. The ſame proceſs may be uſed to make a portable ſoup of the fleſh of poultry; and aromatic herbs may be uſed as a ſeaſoning, if thought proper. Theſe tablets or cakes may be kept four or five years. When intended to be uſed, the quantity of half an ounce is put into a large glaſs of boiling water, which is to be covered, and ſet upon hot aſhes for a quarter of an hour, or until the whole is entirely diſſolved. It forms an excellent ſoup, and requires no addition but a ſmall quantity of ſalt. The cakes of "hockiac," which are prepared in China, and are known in France by the name of "colle de peau d'ane," are made with animal ſubſtances, they are uſed in diſorders of the lungs, in the doſe of from half a dram to two drams.

M. Prouſt, profeſſor of chemiſtry at Madrid, has publiſhed directions for preparing jelly from bones in a work, entitled "An Inquiry into the Means of Improving the Subſiſtence of the Soldier." In order to obtain this jelly in an expeditious and cheap manner, he directs that the bones ſhould be reduced into powder; which may be very readily done between a pair of toothed iron cylinders, as in the ammoniac works. The bones thus comminuted, are to be boiled in eight or ten times their weight of water for the ſpace of four hours, or till about half the water is waſted, when the liquor will be found on cooling of a due gelatinous conſiſtence. A veſſel with a tight cover ſhould be uſed, that the water may acquire as much heat as poſſible; but it ſhould not be of copper, as this metal is eaſily diſſolved by animal mucilage. According to the experiments of M. Prouſt, 5lbs. of the middle part of the bone of a leg of beef, will afford nine pints of jelly; the ſame quantity of the bone of the joint, 15 pints; of the ribs and ſpine, 11 quarts; of the rump and edge bone, 13 quarts. Five pounds of mutton bone of every ſort together, give 19 pints of jelly. Pig's bones yield a little more, the flavour of which is the moſt agreeable. In warm weather the liquor muſt be boiled down ſomewhat more, if it be intended to aſſume the ſame gelatinous conſiſtence when cold; as the ſame quantity of bone that would afford a quart of jelly in winter, will not yield above a pint and a half, or a pint and a quarter in ſummer, but then it contains proportionally more nouriſhment. If this jelly be boiled till it acquires a conſiſtence a little thicker than a ſyrup, then poured out into plates, and when cold cut into pieces, and dried on a net, it will keep a long time, and be particularly uſeful at ſea. One ounce of this dry portable jelly being ſoaked in water for a quarter of an hour to ſoften it, and then boiled, will make from a pint and a quarter to a quart of jelly, according to the ſeaſon, and equally as good as that which is freſh extracted. Mr. P. prepares, as he informs us, a very pleaſant reſtorative for the ſick, by 1½ ounce of ſugar, and a little ſalt, to 14 or 15 ounces of the jelly, and then making it into an emulſion with 12 ſweet and four bitter almonds, and a little orange peel. We ſhall here add, that Mr. P. chops the refuſe bones, before they are ground for extracting the jelly, into pieces about an inch long with a cleaver, then throws them into a kettle of water, and lets them boil for a quarter of an hour. The fat obtained in this manner from 16lbs. of rump and edge-bones weighed, when cold, two pounds; and from the ſame quantity of the bones of the joints he obtained four pounds of ſolid fat. This, he obſerves, when freſh, may be uſed for various ordinary purpoſes; when it has been kept for ſome time expoſed to the air, it becomes very good tallow for making candles.

JELLY, *Flax-ſeed.* See FLAX-SEED *Jelly.*

JELLY, *Oat*, a preparation of common oats, recommended by many of the German phyſicians in all hectic diſorders, to be taken with broth of ſnails or cray-fiſh.

It is made by boiling a large quantity of oats, with the huſk taken off, with ſome hartſhorn ſhavings and currants together, with a leg of veal cut to pieces, and with the bones all broken; theſe are to be ſet over the fire with a large quantity of water, till the whole is reduced to a ſort of jelly, which when ſtrained and cold will be very firm and hard. A few ſpoonfuls of this are to be taken every morning, diluted with a baſon of either of the above-mentioned broths, or any other warm liquor. See GELATIN.

JELLY, *Star-wort.* See STAR-WORT *Jelly.*

JELMO, in *Geography*, a ſmall iſland in the North ſea, near the coaſt of Lapland. N. lat. 74° 8'.

JELMORE, a town of Hindooſtan, in the circar of Cicacole; 15 miles N. of Cicacole.

JELNA, a town of Lithuania, in the palatinate of Wilna; 10 miles S.E. of Lida.

JELOLPOUR, a town of Hindooſtan; 22 miles N.N.W. of Benares.

JELONGA, a town of Bengal; 13 miles E. of Doeſa.

JELPESH, a town of Bengal; 30 miles W.N.W. of Beyhar.

JELPIGORY, a town of Bengal; 40 miles W. of Beyhar.

JELSO, a town of Norway, in the dioceſe of Bergen; 22 miles N.N.E. of Stavanger.

JELVADI, a town of Aſiatic Turkey, in Natolia; 22 miles E. of Iſbarteh.

JEMAMA. See IMAMÉ.

JEMAPETTA, a town of Hindooſtan, in Barramaul; 12 miles S.E. of Namacul.

JEMARROW, a kingdom of Africa, on the S. ſide of the river Gambia; 120 miles from the ſea; inhabited by Mahometans.

JEMBA, a river of Ruſſia, which riſes in the province of Upha, and runs into the Caſpian ſea. N. lat. 46° 57'. E. long. 54° 39'.

JEMBUT, in the *Materia Medica*, a name uſed by Avicenna and others, to expreſs the ſeeds in the pods of the carob-tree, or ſiliqua dulcis; which they call charub or charnub, and the Greeks ceratium.

JEMME, EL, in *Geography*, a town of Africa, in the kingdom of Tunis, called alſo Tiſdra or Tiſdrus. This town abounds with antiquities, ſuch as altars, ſtatues, and a ſpacious amphitheatre, in a decayed and mutilated ſtate; 40 miles S.S.E. of Cairoan.

JEMDAR, a town of Hindooſtan, in Bahar; 17 miles E. of Hajypour.

JEMLAH, a town of Thibet, which gives name to a diſtrict; 230 miles N. of Fyzabad. N. lat. 30° 35'. E. long. 81° 33'.

JEMMAPE, or Gemappe, a department of France, being one of the 13 belonging to the region, called the re-united country; formed of portions of Auſtrian Hainaut, of Brabant, of Liege, and of Namur; W. of the Sombre and Meuſe; in N. lat. 50° 30'. The capital is Mons. It contains, in extent of territory, 3865 kiliometres, and in population 412,129 perſons. It is divided into three diſtricts, *viz.* Tournay, Mons, and Charleroy, 32 cantons, and 423 communes. Tournay has 165,988 inhabitants, Mons 138,533, and Charleroy 107,608. The total of contributions is 3,158,038 francs, and for expences, adminiſtration, judiciary, and for public inſtruction, 267,267 fr. 76 cents. This department comprehends a great variety of ſoil and productions, with mines of iron, coal, quarries of marble, &c.

JEMMINGHEN, or Jemgum, a town of Eaſt Frieſland; 8 miles S.E. of Emden.

JEMOO, a river on the N. ſide of the iſland of Java, which runs into the ſea. S. lat. 6° 47'. E. long. 111° 8'.

JEMRIGAUCHY, a town of Bootan; 15 miles N.E. of Taſſaſudon. N. lat. 28°. E. long. 89° 45'.

JEMROUD, a town of the kingdom of Candahar; 30 miles W. of Ghizni.

JEMSEG, a town of New Brunſwick; 25 miles E.S.E. of Frederick Town. N. lat. 45° 55'. W. long. 66° 13'.

JEMSERUM, a town of Sweden, in the province of Smaland; 45 miles N. of Calmar.

JENA, a town of Germany, in the principality of Eiſenach, near the Saale, ſituated in a pleaſant valley among riſing hills, which produce great quantities of wine. It is ſurrounded with walls, ditches, and towers, and it has an univerſity founded in 1548. The town has four fauxbourgs; 10 miles E. of Weimar. N. lat. 50° 54'. E. long. 11° 30'.—Alſo, a town of South America, in the province of Quito; 12 miles S. of Archidona.

JENET, a town of Africa, in Sahara; 200 miles S.E. of Gadamis. N. lat. 27° 50'. E. long. 13° 10'.

JENGHIJE', a town of the Arabian Irak, on the Tigris; 12 miles N.W. of Bagdad.

JENGHIKAND, a town of Turkeſtan, on the Sirr; 27 miles W.S.W. of Tonkat.

JENGI, a town of Hindooſtan, in the country of Cutch, near the coaſt; 21 miles S. of Tahej.

JENGOKO, a town of Japan, in the iſland of Niphon; 50 miles E. of Jedo.

JENHAT, a circar of Hindooſtan, in the ſubah of Lahore, ſituated between the rivers Behat and Chunaub, about 120 miles long from N. to S. and from 10 to 50 broad: the chief town is Gujurat.

JENJAPOUR, a town of Hindooſtan, in Bahar; 20 miles E.N.E. of Durbungah. N. lat. 26° 14'. E. long. 86° 28'.

JENI-BASAR, or Novi-basar, a town of European Turkey, in Bulgaria, on a branch of the river Ibar, containing about 300 houſes, occupied by Chriſtians and Turks; anciently the capital of the Raſcians; 83 miles N.E. of Raguſa. N. lat. 43° 40'. E. long. 19° 59'.

JENJEREE, a town of Hindooſtan, in Bahar; 30 miles N.E. of Monghier.

JENJIAM, a town of Hindooſtan, in Moultan; 40 miles W. of Adjodin.

JENIKALE, a town of Ruſſia, in the government of Taurida, in the narrow channel, called the ſtrait of Taman, between the Black ſea and the ſea of Azoph; 15 miles N.E. of Kerch. N. lat. 45° 10'. E. long. 36° 10'.

JENIKOW, a town of Bohemia, in the circle of Czaſlau; 24 miles S.W. of Czaſlau.

JENISHEHR, a town of Perſia, in the province of Jorjan; 15 miles S.E. of Jorjan.

JENITZA, a town of European Turkey, in Macedonia, ſeated on a lake that communicates with the gulf of Saloniki by means of a canal about twelve miles long, anciently the capital of Macedonia, but now a heap of ruins; 24 miles W.N.W. of Saloniki. N. lat. 40° 48'. E. long. 22° 30'.

JENKIN, Robert, in *Biography*, was born at Minſter, in the iſle of Thanet, in Kent, in the year 1656. He received his claſſical education in King's ſchool at Canterbury, whence he was ſent to the univerſity of Cambridge when he was about eighteen years of age. In 1680 he was elected fellow of St. John's college, and five years afterwards appointed chaplain to Dr. Lake, upon the tranſlation of that learned prelate from Briſtol to the ſee of Chicheſter. In 1688 his patron gave him the precentorſhip of his cathedral church, but upon his refuſing to take the oaths at the revolution he was obliged to reſign that preferment, and to retire alſo from his fellowſhip. Little is known of Mr. Jenkin during the next twenty years, but we find him doctor of divinity and maſter of his college in the year 1711, and at the ſame time he was appointed lady Margaret's profeſſor of divinity. On the acceſſion of George I., an act was paſſed obliging all thoſe who held any poſt, of 5*l.* per ann., to take the abjuration oath. Dr. Jenkins had, at this period, no heſitation in conforming, but he was ſo much affected at being obliged to eject many worthy and conſcientious men who could not ſubſcribe, that he even fell into a ſtate of childiſhneſs. He died in the year 1727. As an author he is known by "An hiſtorical Examination of the Authority of General Councils, ſhewing the falſe Dealing which hath been uſed in publiſhing them:" "The Reaſonableneſs and Certainty of the Chriſtian Religion:" and many controverſial pieces, particularly "Remarks on ſome Books lately publiſhed, *viz.* M. Baſnage's Hiſtory of the Jews: Mr. Whiſton's eight Sermons: Mr. Locke's Paraphraſe, &c." In another work he accuſes M. Le Clerc of treating the fathers, eſpecially St. Auguſtine, with unjuſt ſeverity.

Jenkin's *Town*, in *Geography*, a ſettlement on the coaſt of Africa, in the country of Scherbro. N. lat. 7°. W. long. 11° 50'.

JENKINS, *Sir* Leoline, in *Biography*, a ſtateſman, was born at Llantriſaint, in Glamorganſhire, in the year 1623. Having laid a good foundation in grammar-learning at Cowbridge, he went to Oxford, where he remained till after the death of the king in 1648. Upon that event he retired into his native country, and was employed in the tuition of the eldeſt ſon of ſir John Aubrey, and other young perſons of family attached to the epiſcopal church. At length, falling under ſome ſuſpicion, he thought it adviſable to go abroad. During three years he led his pupils through a courſe of ſtudy and travel upon the continent; when he returned and lived in retirement till the reſtoration. In 1661 he was choſen principal of Jeſus college, a poſt which he held till 1673. In the mean time he applied himſelf diligently to the civil law, was admitted an advocate of the court of arches, and roſe ſucceſſively to the offices of judge of the admiralty and judge of the prerogative court: he was likewiſe appointed one of the commiſſioners for recovering the effects of the queen-mother of France, lately dead. For his ſervices on this occaſion he had the honour of knighthood conferred upon him. In 1673 he was appointed one of the ambaſſadors plenipotentiary for concluding the peace of Nimeguen, and on his return to England he was elected repreſentative in parliament for the univerſity of Oxford, where he oppoſed the bill for the excluſion of the duke of York, ſoon after he was made ſecretary of ſtate and a privy counſellor. He died in 1685, and was buried in the chapel of Jeſus college, to which he was a great benefactor. His letters and papers were printed in two volumes folio. "He was," according to biſhop Burnet, "a man of exemplary life, and conſiderably learned; but he was dull and ſlow: he was a great aſſertor of the divine right of monarchy, and was for carrying the prerogative very high. He neither ſpoke nor wrote well." He bequeathed the greater part of his property to charitable uſes. Biog. Brit.

Jenkins, John, an Engliſh muſician of great eminence in the 17th century, was born at Maidſtone, in Kent, 1592. He was a voluminous compoſer of fancies for viols during the reign of Charles I. and the interregnum, which were in great favour throughout the kingdom. Inſtrumental muſic was in a very rude ſtate at this time. His firſt publication, however, was vocal, being a collection of ſongs under the title of "Theophila, or Love's Sacrifice," folio, 1651. None of the infinite number of pieces that he compoſed for viols, which occur in all the manuſcript collections of the times, were printed; yet, in 1660, he publiſhed twelve ſonatas for two violins and a baſe, with a thorough-baſe for the organ or theorbo, which were re-printed in Holland, 1664. Theſe were profeſſedly in imitation of the Italian ſtyle, and the firſt of the kind which had ever been produced by an Engliſhman. It was at this time an inſtance of great condeſcenſion for a muſician of character to write expreſsly for ſo ribald and vulgar an inſtrument, as the violin was accounted by the lovers of lutes, guitars, and all the fretful tribe.

In manuſcript memoirs of muſic, written by the honourable Roger North, of Rougham, in Norfolk, brother of the lord keeper North, to which we were allowed acceſs by his deſcendant, the late Rev. Dr. Montague North, canon of Windſor, there is a very diffuſive account of Jenkins, the circumſtances of whoſe life have ſuggeſted to the author many moral reflections on the inſtability of muſical renown. "It is of ſmall importance," ſays he, "to the ſtate of the world, or condition of human life, to know the names and ſtyles of thoſe compoſers of our own country who have excelled the Italians themſelves in every ſpecies of muſic, but that for the voice; therefore the oblivion of all ſuch things is no great loſs. But for curioſity ſake, as other no leſs idle antiquities are courted, it would doubtleſs afford ſatisfaction to profeſſors and lovers of the art, if they could acquire true information concerning their names, characters, and works: of the latter, much knowledge might be obtained, if the old collections, not yet rotten, of many patrons of muſic were acceſſible. In theſe we might ſtill find the productions of Alphonſo, Feraboſco, Coperario, Lupo, Mico, Eſte, and divers others, eſpecially of John Jenkins, whoſe muſical works are more voluminous, and, in their time, were more eſteemed than all the reſt, though they now (1728) lie in the utmoſt contempt.

"I ſhall endeavour to give a ſhort account of this maſter, with whom it was my good chance to have had an intimate acquaintance and friendſhip. He lived in king James's time, and flouriſhed in that of king Charles I. His talents lay chiefly in the uſe of the lute and baſe, or rather lyra-viol. He was one of the court muſicians, and was once brought to play upon the lyra-viol before king Charles I. as an extraordinary performer. And when he had done, the king ſaid he did wonders upon an inconſiderable inſtrument. The lyra-viol was a viol da gamba, with more ſtrings, but differently tuned from the common ſix-ſtring baſe. Its notation, like that of the lute, was written in entablature. He left London during the rebellion, and paſſed his time at muſical gentlemen's houſes in the country, where he was always courted, and at home, wherever he went; and in moſt of his friends houſes there was a chamber called by his name. For, beſides his muſical excellencies, he was an accompliſhed and ingenious perſon, and of ſuch inoffenſive and amiable manners, that he was eſteemed and reſpected for his virtues and diſpoſition, long after age had deprived him of his muſical powers.

"It is not poſſible to give an account of his compoſitions, they were ſo numerous, that he himſelf outlived the knowledge of them. A Spaniſh nobleman ſent ſome papers to ſir Peter Lely, containing fragments of a conſort (concerto), in four parts, of a ſprightly kind, ſuch as were then called *fancies*, deſiring that he would procure for him the reſt, *coûte qui coûte*. Lely gave me theſe papers, as the likelieſt perſon to get them perfected. I ſhewed them to Jenkins, who ſaid he knew the conſort to be his own; but when or where compoſed he knew not, and was unable to recollect any more about it.

"His fancies were full of airy points, grave and triple movements, and other variety. And all that he produced till his declining age, was lively, active, decided, and fanciful. And of this kind he compoſed ſo much, that the private (or chamber) muſic, in England, was in a great meaſure ſupplied by him; and they were the more coveted, becauſe his ſtyle was new, and, for the time, difficult: for he could hardly forbear diviſions, and ſome of his conſorts were too full of them. But it muſt be owned, that being an accompliſhed maſter on the viol, all his movements laid fair for the hand, and were not ſo hard as they ſeemed.

"His vein was leſs happy in vocal muſic, though he was fond of ſetting words, and occaſionally of teaching to ſing; but he had neither voice nor manner fit for it. In his ſprightly moments he made catches, [nothing of this kind now remains of Jenkins, but his little round: "A boat, a boat, haſte to the ferry," which is a happy ſelection and combination of pleaſing ſounds,] and ſtrains that we called rants, with a piece called "The Cries of Newgate," which was all humour and very whimſical. But of all his concerts, none flew about with his name ſo univerſally as the ſmall piece called his "Bells," or "The Five Bell Conſorte." In thoſe days the country fiddlers were not ſo well ſupplied with light muſic from London, as ſince; and a maſter that furniſhed them with new tunes, that they were able to play, was a benefactor."

Jenkins lived to the great age of eighty-ſix, eighteen years after the reſtoration. And Mr. North, the author of theſe memoirs, who was born in 1650, lived till 1733.

Jenkins's *Bay*, in *Geography*, a bay on the back part of the iſland of St. Euſtatius.

Jenkins's *Iſland*, a ſmall iſland near the coaſt of South Carolina. N. lat. 32° 20′. W. long. 80° 40′.

JENKING, in *Mining*, is applied, in ſome diſtricts, to the laſt operations in a coal-pit, or ſome part of the ſame, which is about to be abandoned: that of perforating, or robbing of the pillars or ribs of coal which have been left to ſupport the roof.

JENKYNS, David, in *Biography*, an intrepid judge, was born at Pendoylen, in Glamorganſhire, and admitted a commoner of Edmond-hall, Oxford, in 1597. From thence he removed to Gray's-inn, and became an eminent counſellor. By king Charles I. he was appointed a Welch judge, and in 1645 he was taken priſoner at Hereford for his activity in the royal cauſe, and ſent to the Tower. Being brought to the bar of the houſe of commons he denied the authority of the houſe, and refuſed to kneel, for which he was fined 1000*l.* and remanded to priſon. In 1650 an act was paſſed for his trial, but it never took place. He expected to be hanged, and declared that he would die with the bible under one arm, and magna charta under the other. In 1656 he obtained his liberty, and died in 1663. His tracts on legal and political ſubjects were printed in 1681, in one vol. 12mo.

JENNE', in *Geography*, a town of Africa, in Bambarra, ſituated on an iſland in the river Niger or Joliba, at the diſtance of two days' journey from the lake Dibbie in the ſame river; about 150 miles N.E. of Sego, and about 165 miles S.W. from Tombuctoo. N. lat. 15° 13'. W. long. 0° 40'. Although the town of Jenné is nominally a part of the king of Bambarra's dominions, it is in fact a city of the Moors; the chief part of the inhabitants conſiſting of Buſkreens, or Mahometans, and even the governor himſelf being of the ſame ſect.

Jenné, a town of Japan, on the N. coaſt of Niphon; 8 miles N.W. of Kanazava.

JENNET, in *Horſemanſhip*. See Horse.

JENNIDAH, in *Geography*, a town of Bengal; 14 miles N.W. of Mahmudpour.

JENNINGS, David, in *Biography*, ſon of an ejected miniſter, was born at Kibworth, in Leiceſterſhire, in the year 1691. He obtained a good ſtock of grammar learning at the free-ſchool of his native place, and about the year 1709 he was ſent to purſue a courſe of academical ſtudies in London, under the care of Dr. Chauncey. Having finiſhed his ſtudies he was appointed one of the preachers at an evening lecture at Rotherhithe, and in 1716 choſen aſſiſtant preacher at the meeting near Haberdaſhers-hall. Two years afterwards he was elected paſtor to the congregational church in Old Gravel-Lane, Wapping, with which he maintained that relation during forty-four years. Within a year after he entered this charge, he ſhewed his reſpect and attachment to the rights of conſcience, by refuſing to comply with the requiſition brought forwards by many of the brethren at Salters-hall, to ſign certain articles relating to the Trinity. Mr. Jennings, about the year 1730, publiſhed a ſmall volume of ſermons addreſſed to the young, entitled "The Beauty and Benefit of early Piety," which was followed by other publications of a practical nature. In the year 1740 he entered the liſts againſt Dr. John Taylor, concerning Original Sin. He juſtified the doctrine, and did not act as the fair and liberal antagoniſt; but notwithſtanding their difference in doctrinal points, they were in habits of intimacy and friendſhip with each other as gentlemen. In the year 1743 Mr. Jennings was elected truſtee of Mr. Coward's charities, and one of the lecturers at St. Helen's; and in the following year he became divinity tutor, in the room of Mr. Eames, at the academy, at that time chiefly ſupported by Mr. Coward's funds. In this work he was earneſtly intent: nothing ever diverted him from a daily attendance in the lecture room; and he was indefatigable in the diſcharge of the duties belonging to his office. The habits of early riſing, of order in the arrangement of buſineſs, and of punctuality in his engagements, enabled him to perform more than moſt men would have been able to get through. As a relief to the ſtudies of the mind he employed himſelf in the common mechanical arts of life. His method of communicating inſtruction was eaſy and familiar, and his general deportment towards his pupils affable and friendly. In ſome inſtances he was betrayed into acts of illiberality, which ill accorded with that ſpirit which in younger life led him to reſiſt the impoſition of a formulary of faith, deviſed by the miniſters at Salters-hall. He was determined to maintain, in his academy, the reputation for orthodoxy which it had acquired, and would not ſuffer young men to deviate from his ſtandard of faith. In ſome caſes he had recourſe to expulſion, although the characters of the pupils thus treated were moſt blameleſs and exemplary. In the year 1747 Mr. Jennings publiſhed "An Introduction to the Uſe of the Globes," &c. which maintained a conſiderable degree of popularity for more than half a century. In 1749 the univerſity of St. Andrew's in Scotland conferred on the author the degree of doctor of divinity. After this, he publiſhed "An Appeal to Reaſon and Common Senſe for the Truth of the Holy Scriptures." He died in September 1762, when he was ſeventy-one years of age. He was highly valued by his acquaintance, and he had the honour to educate many pupils who proved ornaments to the diſſenting intereſt, and have rendered eminent ſervice to ſcience and the world, ſome of whom ſtill ſuſtain, by a diligent application of great talents, a reſpectable and commanding rank in life. After his death, was printed, from a MS. copy, "An Introduction to the Knowledge of Medals," conſiſting of a courſe of lectures on the hiſtory, the nature, ſize and ſhape;—the orders into which they are to be diſtinguiſhed;—the impreſſion and form, and value and uſe of medals. In 1766 a more elaborate work was publiſhed by Dr. Furneaux from the MSS. of Dr. Jennings, entitled "Jewiſh Antiquities: or a Courſe of Lectures on the Three Firſt Books of Godwin's Moſes and Aaron: to which is annexed a Diſſertation on the Hebrew Language:" in two vols. 8vo. This is a work of great merit, and deſerves the peruſal of all who would obtain an intimate acquaintance with the ſcriptures, particularly of the Old Teſtament. A new edition of the "Jewiſh Antiquities" was publiſhed about three years ſince, it having been long out of print, and very much called for.

Jennings's *Iſland*, in *Geography*, a ſmall iſland in the gulf of Florida, near the coaſt of Eaſt Florida. N. lat. 25° 28'. W. long. 80° 28'.

JENOYPOUR, in *Geography*, a town of Hindooſtan, in Allahabad; 24 miles N. of Gazypour.

JENSON, or Janson, Nicholas, in *Biography*, an eminent printer of the 15th century, was brought up to the art of engraving. He was taken away from his employment by Lewis XI., and ſent to Mentz to endeavour to bring away the ſecret of the new diſcovery of typography. By another account it ſhould ſeem that he was ſent on this miſſion by Charles VII. in 1458, and it ſays, that Jenſon, on his return, finding that the king was dead, went and ſettled elſewhere. He exerciſed his profeſſion at Venice, in which he acquired a high degree of reputation in the the three branches of cutting punches, founding types, and printing. He formed the preſent Roman character, the neatneſs of his types command admiration even in the modern improved ſtate of the art, and his editions are in great requeſt with the curious. The firſt work which iſſued from Jenſon's preſs is one entitled "Decor Puellarum," in 1471. Several editions of Latin books followed, of which the one of the lateſt date is 1481, thought to be the laſt year of his life.

JENTLING, in *Ichthyology*, the name of a river fiſh caught in the Danube, and moſt of the great rivers in Germany, and called by the Germans *ſchead, ſcheat, jent,* and *koppen;* and by Geſner *capito cæruleus,* the blue chub. See Cyprinus *Jeſes.*

JENUCHSHADEGA, in *Geography*, an Indian village in Pennſylvania, on the W. bank of Alleghany river; 14 miles S. E. from the outlet of Chataughque lake.

JENYNS, Soame, in *Biography*, the only ſon of ſir Roger Jenyns, of Bottiſham-hall, Cambridgeſhire, was born in London in 1704. He was educated under his father's roof till he was ſeventeen years of age, when he was entered a fellow-commoner of St. John's college, Cambridge. He was diligent in his ſtudies, and ſpent three years at the univerſity, after which he entered upon a courſe of life well adapted to a man of independent fortune. In his firſt marriage he was not fortunate, a ſeparation took place, which the lady did not long ſurvive: but his ſecond wife outlived him. In younger life he ſuſtained the character of a beau, and his polite attention to the ladies was diſplayed in his firſt performance, as an author, which was a poem on "The Art of Dancing," publiſhed in 1728, and dedicated to lady Fanny Fielding. From this period he continued to make himſelf known occaſionally by pieces in verſe, which were ſufficiently numerous to be collected into a volume in 1752. At the death of his father his fortune enabled him to become a repreſentative in parliament for the county of Cambridge. He began his ſenatorial career by ſupporting ſir Robert Walpole, probably on account of his attachment to the Whig intereſt, and he continued ever afterwards the habitual adherent to the miniſter for the time being. This pliant conduct was rewarded by the place of one of the lords of the Board of Trade, which he held from 1755, through every change, till the Board itſelf was aboliſhed, as an uſeleſs appendage to government, in the year 1780. He was ever inclined to moderate meaſures, and was in his own mind againſt the coercion made uſe of with regard to the Americans; he wrote in defence of dean Tucker's ſcheme of leaving the coloniſts to themſelves, with the expectation, that when tired of freedom, they would gladly reſume their dependence on the mother country. As an author, Mr. Jenyns attained a conſiderable ſhare of celebrity. His poems conſiſt of a variety of miſcellaneous pieces; but his proſe works are, in point of ſtyle, of a ſuperior degree of excellence: his language is pure and perſpicuous, and at the ſame time animated with wit and embelliſhed with eloquence. He was a contributor to the periodical publication entitled "The World," and his papers, five in number, are diſtinguiſhed by humour and vivacity. In 1757 he publiſhed a "Free Enquiry into the Origin of Evil, in ſix Letters." To account for the exiſtence of evil under the government of an infinitely wiſe and good Being, he thought that to produce good excluſive of evil is one of thoſe impoſſibilities which even divine power cannot accompliſh. This related to natural or phyſical evil: with reſpect to moral evil, his theory was, that it is permitted in order to provide objects for the juſt infliction of thoſe natural evils which were unavoidable. His work produced many able replies, beſides a very ſevere and maſterly critique from the pen of Dr. Johnſon, which appeared in the Literary Magazine, and which Jenyns never forgot nor forgave. In 1756 he publiſhed a pamphlet in favour of a "National Militia," and in 1767 another, entitled "Thoughts on the Cauſes and Conſequences of the High Price of Proviſions," &c. which proves that he paid much attention to political economy. In 1776 he reſumed his theological diſcuſſions by a work which was much read, *viz.* "A View of the Internal Evidence of the Chriſtian Religion." The foundation of his reaſoning in this piece is, that this religion contains a ſyſtem of ethics not only ſuperior to, but unlike every thing which had before entered into the mind of man, and therefore that it muſt have had a divine origin. He contends that it not only carries moral purity to a degree beyond what was ever inculcated by any ſect of philoſophers, but that it wholly omits or diſparages many virtues on which they lay a great ſtreſs; as valour, patriotiſm, and friendſhip. He contends that it muſt be of divine origin becauſe no man could have imagined or propoſed ſuch a ſyſtem. This kind of defence of the truth of our holy religion led to the ſuſpicion that he was, under the maſk of friendſhip, undermining its foundation, and he met with ſome ſevere ſtrictures from ſeveral friends of rational religion, who were unwilling to abandon reaſon in their regard for Chriſtianity. Upon, however, a fair and candid view of the ſubject, Mr. Jenyns was probably a very ſincere Chriſtian; the whole of his life and converſation bore witneſs to the ſincerity of his views. In 1782 he publiſhed "Diſquiſitions on various Subjects;" in theſe he argues for the pre-exiſtent ſtate of mankind for the purpoſe of accounting for the miſeries to which they are expoſed in this world: and with regard to Chriſtianity he ſays that its doctrines are "ſo adverſe to all the principles of human reaſon, that, if brought before her tribunal, it muſt evidently be condemned:" but the chief force of his wit and argument is directed againſt the principles of civil liberty, towards which he ſhews the moſt determined hoſtility. He died at the advanced age of eighty-three, in December 1787. As a country gentleman he maintained a very reſpectable character: he was upright in his conduct, and exemplary in the performance of religious duties. With the livelineſs of a man of wit he joined the urbanity of a polite well-bred gentleman, and his ſocial intercourſe is repreſented as highly engaging and delightful. His works have been collected in 4 vols. 12mo., to which is prefixed an account of his life.

JEOFAILE, or Jeofayle, in *Law*, a compound of three French words *je ay faille, I have failed.* It is uſed in a legal ſenſe, when the parties to any ſuit have, in pleading, proceeded ſo far, that they have joined iſſue, which ſhall be tried, or is tried by a jury, and this pleading or iſſue is badly joined, ſo that it will be error if they proceed.

In this caſe, one of the parties might, by their counſel, ſhew it to the court, as well after verdict given, as before the jury was charged, by ſaying, *This inqueſt you ought not to take;* or, *To judgment you ought not to go.*

But this occaſioning great delays in ſuits, for the redreſs thereof ſeveral ſtatutes were made; *viz.* 32 Hen. VIII. cap. 30. by which it was enacted, "That if the jury have once paſſed upon the iſſue, though afterwards there be found a jeofaile in the pleading, yet ſhall judgment be given according to the verdict of the jury." Other ſtatutes have alſo been made relating to the ſame thing, in the time of queen Elizabeth and king James I.

The 18th Eliz. cap. 14. ordains, that after verdict given in any court of record, there ſhall be no ſtay of judgment, or reverſal, for want of form in a writ, count, &c. or for want of any writ original or judicial; or by reaſon of inſufficient returns of ſheriffs, &c. But this is not to extend to appeals of felony, indictments, &c. By 21 Jac. I. cap. 13. if a verdict ſhall be given in any court of record, the judgment ſhall not be ſtayed or reverſed for variance in form between the original writ or bill, and the declaration; &c. or for want of averment of the party's being living; or becauſe the *venire facias* is in part miſawarded; for miſnomer of jurors; want of return of writs, or becauſe the return officer's name is not ſet to the return, &c. The ſtat. 16 & 17 Car. II. cap. 8. enacts that judgment ſhall not be ſtayed or reverſed after verdict in the courts of record at Weſtminſter, &c. for default in form; or becauſe there are not pledges to proſecute upon the return of the original writ, or becauſe the name of the ſheriff is not returned upon it, for default of alleging the bringing into court of any bond, &c. or for the omiſſion of *vi et armis*, or *contra pacem*; miſtaking the Chriſtian name or ſurname of either party, or the ſum of money, day, month, or year, &c. in any declaration or pleading, being rightly named in any record, &c. preceding, &c. &c. But all ſuch defects as are not againſt the right of the matter of the ſuit, or whereby the iſſue or trial are altered, ſhall be amended by the judges, though not in ſuits of appeal, of felony, indictments, informations on penal ſtatutes, which are excepted out of the act. The 22 & 23 Car. II. cap. 4. made this act perpetual. By 4 & 5 Ann. cap. 16. all the ſtatutes of jeofails ſhall extend to judgments, entered by confeſſion, *nil dicit*, or *non ſum informatus*, in any court of record; and no ſuch judgment ſhall be reverſed, nor any judgment or writ of inquiry of damages thereon ſhall be ſtayed, for any defect which would have been added by thoſe ſtatutes, if a verdict had been given; ſo as there had been an original writ filed, &c. The 5 Geo. I. cap. 13. ordains, that, after verdict given, judgment ſhall not be ſtayed or reverſed for defect in form or ſubſtance, in any bill or writ, or for variance therein, from the declaration, or any other proceeding.

JEOGERY, in *Geography*, a town of Africa, in the kingdom of Jagra. N. lat. 13° 12′. W. long. 14° 57′.

JE OUASET, a town of the Arabian Irak, on the Tigris; 110 miles N.W. of Baſſora.

JEPHTHAH, in *Scripture Hiſtory*, one of the judges of Iſrael, was a ſon of Gilead by one of his concubines, (Judg. xi. 1, 2.) who, upon his father's marriage, was expelled by the family from their houſe; and who, retiring into the land of Tob, became captain of a band of rovers. The Iſraelites, who inhabited beyond Jordan, being preſſed by the Ammonites, applied to Jephthah for aſſiſtance, and offered to place themſelves under his command; accordingly he conſented to ſuccour them on condition that at the end of the war they would acknowledge him for their prince. A.M. 2817. B.C. 1187. Jephthah, having been inveſted with the chief command, remonſtrated with the king of the Ammonites on the injuſtice of the war in which he was engaged, and obtaining no ſatisfactory reply, he levied a powerful army, and marched againſt him to battle. But before he engaged, he made a vow, that he would ſacrifice, or conſecrate to him, the firſt living creature that ſhould come out of his houſe to meet him on his return. The conteſt was ſoon decided by a complete victory; and the conqueror, as he approached his houſe at Mizpeh, perceived his daughter, an only child, advancing to congratulate him on his ſucceſs, with muſic and dancing; and other tokens of filial affection. Recollecting his vow, the interview occaſioned the moſt poignant diſtreſs; but when he communicated it to his daughter, ſhe received the intelligence with a firm and ſubmiſſive mind; and determining to acquieſce in the accompliſhment of her father's vow, ſhe merely requeſted a delay of two months, that ſhe might retire with her companions to lament her infelicity in being devoted to a life of celibacy. At the expiration of the ſtipulated interval, ſhe returned to her father, "who did with her according to the vow which he had vowed." As to the object of this vow, and the manner in which it was fulfilled, Jewiſh and Chriſtian writers, both ancient and modern, have entertained very different ſentiments. It has been a very generally received opinion, that Jephthah offered his daughter as a burnt ſacrifice; and in favour of this notion it has been alleged, that it is moſt agreeable to the natural conſtruction of the Hebrew text; that there is no rule, or precedent in ſcripture, to juſtify the practice of devoting perſons to perpetual virginity, and that this would have been as contrary to the law of God as if he had ſacrificed her; that when Jephthah made this vow, he could have expected no perſon to come out of his door to meet him, but a human perſon; that if he had intended no more than the ſacrifice of a bullock, or a ram, there was no occaſion for ſuch a ſolemn vow, or if he had meant a brutal ſacrifice, he would have vowed the offering of hecatombs rather than of a ſingle animal, on an occaſion which he thought ſo important and intereſting; and, moreover, that it was a "cuſtom in Iſrael, that the daughters of Iſrael went yearly to lament the daughter of Jephthah," (Judg. xi. 39, 40.) and this cuſtom, it is ſaid, ſeems to have been intended for an annual rite *in perpetuum*, and not that they went yearly to talk with her, as long as ſhe lived. On the other hand, it has been maintained by writers of great celebrity, that Jephthah, a judge of the Hebrew people, who were mere worſhippers of the true God, whoſe law did not admit of human ſacrifices, who had often declared his abhorrence of ſuch abominations, and who had on this account rejected the Canaanites, could not have been guilty of this groſſeſt act of heathen ſuperſtition; more eſpecially as his name is connected with other ancient worthies, who in the epiſtle to the Hebrews (xi. 32.) are enumerated as illuſtrious inſtances of the power of faith. Accordingly they have argued that Jephthah devoted his daughter to perpetual virginity, for the honour, and in the ſervice, of God. They allege, that ſhe deſired time, before the vow was accompliſhed, to bewail her virginity, and not the loſs of her life. (Judg. xi. 37.) The object of the vow was, therefore, perpetual virginity, and not death; and Jephthah would naturally be troubled, when his daughter met him (v. 35.) becauſe ſhe was his only child (v. 34.), and the accompliſhment of his vow, in the milder ſenſe of it, would render his family extinct in Iſrael, and he would thus exclude himſelf from the proſpect of having the Meſſiah among his deſcendants. In favour of the milder interpretation of this vow it is further pleaded, that the words לתנות לבת־יפתח (Judg. xi. 40.) which we render "to lament the daughter of Jephthah," ſhould be rendered "to talk with the daughter of Jephthah," that is, to viſit and comfort her in her recluſe life: the word תנה being juſtly rendered (Judg. v. 11.) to rehearſe. It is further ſaid, that in the words והיה ליהוה והעליתיהו עולה that occur in Jephthah's vow (Judg. xi. 31.), the ו (vau) ſhould be underſtood not copulatively, but disjunctively; and then the meaning would be, "whatſoever cometh to meet me, ſhall either be the Lord's, or I will offer it up for a burnt offering;" that is, in caſe it ſhould be a creature fit for ſacrifice. Others have thought it neceſſary to vindicate Jephthah's character from the blemiſh of murder; they have alſo pleaded, that he is not cenſured in any part of ſacred hiſtory for this act; that God would not have given victory and ſucceſs to Jephthah in his expedition againſt the Ammonites, upon his obliging himſelf under a ſolemn vow to offer a human ſacrifice; and that he is mentioned, as we have already ſaid, in the catalogue of believers in the epiſtle to the Hebrews. Although we can lay no great ſtreſs on ſome of the arguments that are alleged in vindication of Jephthah's character, and we cannot help conſidering his vow as raſh and unguarded; we muſt incline to the more favourable opinion. It is not improbable, that Homer grounded his fable of Agamemnon's ſacrificing his daughter Iphigenia on ſome tradition of Jephthah's ſacrifice; and it is urged, that the name of Iphigenia ſeems to be a corruption of Jephthigenia, the daughter of Jephthah. Ovid, who has dreſſed up the ſtory in his way, makes Diana put a ſtag in her room; and ſeems, therefore, to have blended the tradition of Abraham's ſacrifice with that of Jephthah.

Soon after Jephthah was exalted to that dignified ſtation, which was the recompence of his valour, the Ephraimites, envious of that glory in which they had not been allowed to participate, combined againſt him; but the conteſt was ſoon determined by their entire defeat. The Gileadites, whom he had commanded, ſeized the fords of the river Jordan, and put to death all thoſe fugitives who endeavoured to eſcape into their own country; and in order to diſtinguiſh Ephraimites from other Iſraelites, who had occaſion to croſs the river, he ordered them to pronounce the word "Shibboleth," ſignifying an ear of corn, and which was pronounced "Sibboleth" by thoſe of that tribe. As many, therefore, as were detected by this teſt were killed without mercy. The number of the Ephraimites that fell on this occaſion amounted to 42,000. After this event we know nothing more of Jephthah, excepting that he judged Iſrael, or the two tribes and a half beyond Jordan, ſix years, and then died about the year 1182 B.C. Judges, xi. xii. JEREJA, a town of Africa, in the kingdom of Fonia.

JEREMIAH, in *Scripture Hiſtory*, a canonical book of the Old Teſtament. The divine writer was of the race of the ten prieſts: the ſon of Hilkiah of Anathoth in the tribe of Benjamin. He was called when very young to the prophetic office, about the thirteenth of Joſiah, or 628 B.C.; and continued in the diſcharge of it above forty-one years. Jeremiah's life was often expoſed to danger, and he was committed to priſon, on account of his remonſtrances againſt the kings of Judah, and the predictions, delivered by him, which announced the calamities that awaited them; particularly under the reign of Jehoiakim and of Zedekiah. After the conqueſt of Jeruſalem by Nebuchadnezzar, he was ſet at liberty by order of the king, and it was left to his option either to accompany Nebuzaradan, the general of Nebuchadnezzar, to Babylon, or to remain in Judea with Gedaliah, who was appointed governor of the miſerable remnant of the people that was left in that country. Jeremiah preferred the latter alternative, and went to reſide with Gedaliah at Mizpeh. After the aſſaſſination of Gedaliah, Jeremiah, accompanied by Baruch, removed to Egypt. Of the ſubſequent events of his life, we have no authentic account. He is ſaid by St. Jerom, &c. to have been ſtoned to death by the Jews at Tahpanhes, where he reſided, for preaching againſt their idolatry; but it is moſt likely that he died in Egypt, much advanced in years, and broken by the calamities which happened to himſelf and his country. Some rabbis, however, aſſert, that he returned to Judea, and others ſay that he went to Babylon, and died there.

There were ſeveral collections of Jeremiah's prophecies; one made by God's command in the fourth year of Jehoiakim, chap. xxxvi. 2. This contained all the prophecies he had publiſhed to that time, as well againſt the other nations as againſt the Jews. The former of theſe in our preſent collection are put by themſelves at the end of the book, from chap. xlvi. to the end of the laſt. But in the preſent copies of the Septuagint they follow immediately after the thirteenth verſe of the twenty-fifth chapter. Another collection of theſe prophecies, mentioned chap. i. 3. comprehends all thoſe which Jeremiah had uttered to the time of the captivity, and were probably collected by Baruch, his amanuenſis, and are put together without any regard to the order of time. To this was added another collection of prophecies, publiſhed about the time of his going down into Egypt, contained in chap. xlii. xliii. xliv. at the end of which Ezra, or ſome others, after the captivity, added thoſe prophecies which Jeremiah delivered againſt the Gentiles. The fifty-ſecond chapter was probably added by Ezra, and is chiefly taken out of the latter part of the ſecond book of Kings, with additions, which Ezra might ſupply out of the public records. The book of Jeremiah is altogether written in Hebrew, except the eleventh verſe of the tenth chapter, which is Chaldee.

It has been obſerved, that there is great confuſion in the arrangement of Jeremiah's prophecies. A late excellent commentator, Mr. Blaney, has endeavoured, with great judgment, to reſtore their proper order, by a tranſpoſition of the chapters, wherever it appeared to be neceſſary. The firſt twelve chapters ſeem to contain all the prophecies that were delivered in the reign of Joſiah. Soon after the acceſſion of Jehoiakim to the throne, upon the depoſition of Jehoahaz, Jeremiah was commiſſioned to denounce the divine judgments againſt him and the people, unleſs they repented of their wickedneſs. He thus provoked their indignation; and they accuſed him as a perſon whoſe ſedition deſerved death. He was acquitted, however, by the nobles, and by a powerful influence preſerved from the king's vengeance. About four years afterwards he predicted the deſtruction of Jeruſalem and of the temple, and the Babyloniſh captivity, which he foretold would laſt 70 years. For this prophecy he was ſent to priſon, and he narrowly eſcaped with his life. His prophecies under this reign are continued from the 13th to the 20th chapter incluſively; to which we muſt add the 22d, 23d, 25th, 26th, 35th and 36th chapters, together with the 45th, 46th, 47th, and probably the 48th, as far as the 34th verſe of the 49th chapter. Under the reign of Zedekiah, the laſt king of Judah, Jeremiah was frequently deputed to the exerciſe of his prophetic office. His predictions in this reign were contained in the 21ſt and 24th chapters, the 27th to the 34th, and the 37th to the 39th incluſively, together with the laſt ſix verſes of the 49th chapter, and the 50th and 51ſt chapters concerning the fall of Babylon. It does not appear at what period of Jeremiah's life he delivered the prophecy concerning the future reſtoration of Iſrael to their own land, and the re-eſtabliſhment of their civil and religious conſtitution under the Meſſiah, comprized in the 30th and 31ſt chapters.

St. Jerom has obſerved upon this prophet, that his ſtyle is more eaſy than that of Iſaiah and Hoſea; that he retains ſomething of the ruſticity of the village where he was born; but that he is very learned and majeſtic, and equal to thoſe two prophets in the ſenſe of his prophecy.

We ſhall cloſe this article with an extract from the admirable lectures of biſhop Lowth (ſee lect. xxi.) relating to the character of Jeremiah as a writer. "Iſaiah," he ſays, "Jeremiah, and Ezekiel, as far as relates to ſtyle, may be ſaid to hold the ſame rank among the Hebrews, as Homer, Simonides, and Æſchylus, among the Greeks." "Jeremiah, though deficient neither in elegance nor ſublimity, muſt give place in both to Iſaiah. Jerom ſeems to object againſt him a ſort of ruſticity of language, no veſtige of which, I muſt however confeſs, I have been able to diſcover. His ſentiments, it is true, are not always the moſt elevated, nor are his periods always neat and compact; but theſe are faults common to thoſe writers, whoſe principal aim is to excite the gentler affections, and to call forth the tear of ſympathy or ſorrow. This obſervation is very ſtrongly exemplified in the *Lamentations* (ſee that article), where theſe are the prevailing paſſions; it is however frequently inſtanced in the prophecies of this author, and moſt of all in the beginning of the book (ch. ix. xiv. 17, &c. xx. 14—18.) which is chiefly poetical. The middle of it is almoſt entirely hiſtorical. The latter part, again, conſiſting of the ſix laſt chapters, is altogether poetical (ch. xlvi—li. to v. 59.); it contains ſeveral different predictions, which are diſtinctly marked, and in theſe the prophet approaches very near the ſublimity of Iſaiah. On the whole, however, I can ſcarcely pronounce above half the book of Jeremiah to be poetical."

The verſion of Mr. Blaney, publiſhed in 1784, and accompanied with numerous and valuable notes, is deemed to be the beſt extant; the author having availed himſelf of the aſſiſtance afforded by Dr. Kennicott's collection, and other ſources of information, domeſtic and foreign. Blaney's notes. Lowth de Sacra Poeſi Præl. lect. xxi. Dupin. Lowth's Paraph. Gen. Biog.

Jeremiah, in *Geography*, a town of Paleſtine, anciently called *Anathoth*, the birth-place of the prophet Jeremiah; 6 miles E. of Jeruſalem.

JEREMIE, Cape, a cape on the S. coaſt of the iſland of Hiſpaniola. N. lat. 18° 16′. W. long. 17° 15′.

Jeremie, a juriſdiction, town, and cape, within the bay of Leogane, on the ſouthern peninſula of the iſland of St. Domingo. The juriſdiction contains two pariſhes, and its ſoil is excellently adapted for the culture of coffee. The town is ſeated on the W. ſide of the bay; and point Jeremie lies in N. lat. 18° 42′ 30″. W. long. from Paris 76° 32′.

JEREMYSQUAM, an iſland of America, in Lincoln county and ſtate of Maine, which, with Folly iſland, forms the mouth of Sheepſcott river, in Wiſcaſſet bay.

JERF, a town of Norwegian Lapland; 100 miles W.S.W. of Wardhuys.

JERFALCON, the Engliſh name of the gyrfalco, a very fierce, bold, and large bird, the largeſt of all the falcon kind. See Gyrfalcon.

JERGUER, in the *Cuſtom Houſe*, one who overſees the accounts and conduct of the waiters.

JERICHO, in *Ancient Geography*, a conſiderable city of Paleſtine, in the tribe of Benjamin, about ſix miles W. from Jordan, and 22 almoſt E. from Jeruſalem. It was ſituated in a ſpacious plain, producing all ſorts of fruits, eſpecially palm-trees, whence it was called "the city of palm-trees." Jericho was the firſt city in Canaan taken by Joſhua. (Joſh. ii. 1, 2, &c.) in the year 1469 B.C., and burnt by ſpecial order. About 537 years afterwards, Hiel of Bethel undertook to rebuild it (1 Kings, xvi. 34.); and on this occaſion loſt his two ſons. But before this period there was a city of Jericho in the vicinity of the original place of the ſame name. The Jericho of Hiel acquired its original ſplendour and population: it was adorned with a magnificent palace and other edifices by Herod, and it gained reputation from having been the place where Jeſus Chriſt performed many miracles. Its importance and ſplendour remained for many ages, till at length it was ſacked by Veſpaſian. Adrian re-eſtabliſhed it A.D. 138, and after ſubſequent diſaſters, it was repaired by the Chriſtians, and made the ſeat of a biſhop; but in the 12th century it was finally deſtroyed by the infidels. This famous city, the walls of which were 20 ſtadia, or 2½ miles in circumference, is now reduced to a poor village, called "Raha," on a plain ſix or ſeven leagues long, by three wide, round which are ſeveral barren mountains, that render it extremely hot. Inſtead of the balm of Mecca, which it formerly produced, there is another ſpecies, reſembling a plum-tree, called "Zakkoun," which yields a ſweet oil, celebrated for healing wounds. This is now the ſole commerce of Raha.

Jericho, a town of the duchy of Magdeburg, ſeated on the Elbe; 32 miles N.N.E. of Magdeburg. N. lat. 52° 30′. E. long. 12° 5′.—Alſo, the circle of the ſame duchy, which includes the town, alſo Burg and Sandau, and a few villages.

Jericho, *Roſe of*, in *Botany*. See Anaſtatica.

JERICO, in *Geography*, a poſt-town in Chittenden county, Vermont, S.E. of Eſſex, and N.E. of Williſton, ſeparated from the latter by Onion river, and containing 728 inhabitants.—Alſo, a poſt-town of New York, in Chenengo county, on the E. branch of the Suſquehanna, containing 939 inhabitants.

JERJERAIA, a town of the Arabian Irak, on the Tigris; 36 miles S.E. of Al-Modain.

JERIM, a ſmall town of Arabia, in the province of Yemen, the ſeat of a Dola, who reſides in a caſtle ſituated on a rock. The houſes are built of ſtone, and of bricks which had been dried in the ſun. After a dry ſeaſon, locuſts are very numerous in a plain near this town; they are then gathered and dried for winter proviſions at Jerim, as well as in other places of Arabia. The market is a place of amuſement. Taylors, ſhoemakers, blackſmiths and other artiſans ſat along the ſtreets, behind low walls, and wrought at their trades in the open air. Surgeons were ſeen drawing blood with a common knife, and dreſſing the wound with pieces of hartſhorn, cut off at the root of the horn. The number of houſes in this place is about 2000; 80 miles N.E. of Mocha. N. lat. 14° 17′. E. long. 44° 22′.

JERKIN, a name given by ſome to the male of the jerfalcon. See Gyrfalcon.

JERKITTYA, in *Geography*, a town of Hindooſtan, in Bahar; 22 miles S.E. of Bettiah.

JERMAH, or Germah, a town of Africa, in Fezzan, ſuppoſed to be built on the ſcite of Garama, the capital of the country of the Garamantes; ſituated S. of Zuéela, and nearly at the ſame diſtance from Mourzouk. It is diſtinguiſhed, like Zuéela, by numerous herds, eſpecially of ſheep and goats, that are obſerved around it; by the various and abundant produce of its fields; and by numerous and majeſtic ruins that indicate its former ſplendour; though at preſent the houſes are cottages built of clay; 60 miles S.E. of Mourzouk.

JERMOLI, in *Biography*, the principal tenor ſinger in the comic opera, ſucceeded Trebbi in 1777, when the Todi was the firſt Buffa. Neither his voice, action, or ſtyle of ſinging, were of the firſt claſs, or above mediocrity; and when Lovattini quitted this country, he left a blank in the comic opera, which has never ſince been filled up to our ſatisfaction.

JERMUK, in *Geography*, a river of Syria, anciently "Hieromax," which runs into the lake of Tiberias, near its ſouthern extremity.

JEROM, or Jerome, *St.*, Euſebius Hieronymus, in *Biography*, an eminent father of the Chriſtian church, was born of Chriſtian parents at Stridon, on the confines of Dalmatia and Pannonia, probably about the year 342; though others date his birth in 329, 330, or 331; and as he died in the year 420, they ſay that he was about 90 years of age when he died. Several circumſtances corroborate the former ſtatement, aſſigned by Lardner as the era of his birth. He commenced his ſtudies in grammar and other parts of literature at Rome, where he reſided at the time of the emperor Julian's death. Donatus, the celebrated grammarian, was one of his preceptors; and his ſtudies in logic and various branches of philoſophy were directed by other teachers. His application and proficiency were very diſtinguiſhed at an early period of life; and it appears that, during his reſidence at Rome, he cultivated the theory and practice of rhetoric, and laid the foundation of that extenſive acquaintance with theology and eccleſiaſtical hiſtory, and alſo with the Hebrew language, in which he afterwards excelled. From Rome he removed to Gaul; and at Aquileia he formed an intimate acquaintance with Rufinus, a preſbyter of that city. He afterwards returned to Italy, having collected, while he was in the weſtern empire, a conſiderable library, to which in the progreſs of his life he made many valuable additions. From Italy he went into the Eaſt, where he ſpent ſeveral years, partly in the deſerts of Syria, partly at Antioch, and partly at Conſtantinople. At Antioch he was ordained preſbyter by Paulinus in 378; accepting the office on condition that he ſhould not be confined to one church, or be drawn away from that monaſtic life which he conceived to be moſt favourable to the proſecution of his ſtudies. On this kind of life he ſeems to have entered when he was 30 years of age; and though during a period of four years he enlarged his acquaintance with the oriental languages, and with thoſe branches of knowledge which aſſiſted him in underſtanding and interpreting the ſcriptures, the auſterities he practiſed had ſo impaired his health, that it became neceſſary for him to return to Antioch, in order to recruit his ſtrength. The church at Antioch was at this time diſtracted by contending parties; but Jerome declined taking a decided part with either of them, till he had obtained a letter from Damaſus, biſhop of Rome, which determined him to eſpouſe the cauſe of Paulinus. Having, after his ordination, which we have already mentioned, reſided for ſome time at Bethlehem, he made an excurſion from thence to Conſtantinople, with a view of deriving benefit from the inſtructions of Gregory Nazianzen, and from whom he learned, as he himſelf acknowledges, the right method of expounding the holy ſcriptures. In the year 382, he accompanied Paulinus, biſhop of Antioch, and Epiphanius, biſhop of Salamis in the iſland of Cyprus, to Rome; and here he was employed by pope Damaſus, as his ſecretary, in conducting a variety of negotiations for extending the authority of the papal power. In the ſuperintendance of a ſociety of Roman ladies, who had renounced the world, and devoted themſelves to a religious life, which Damaſus aſſigned him, he acquitted himſelf to the ſatisfaction of the pope; but not without incurring the diſpleaſure of the friends and relations of thoſe weak females, who abandoned their ſtations in civil ſociety, and miſapplied their wealth to the ſupport of uſeleſs and pernicious inſtitutions. He had likewiſe other enemies, who diſapproved the freedom with which he reprehended the corrupt manner of the clergy, and the vices of the people. Another circumſtance that rendered his ſituation at Rome unpleaſant to him was the part he took in his diſputes with the followers of Origen, whom he had often commended, and many of whoſe works he had tranſlated into Latin, but whoſe peculiar opinions he now oppoſed as heretical. The Origeniſts were thus exaſperated, and circulated ſome ſcandalous but unfounded reports of a diſreputable connection with Paula, in whoſe houſe he lodged, and who afterwards, with her daughter, followed him to the Eaſt. (See Euſtochium.) Jerome, thus diſquieted at Rome, determined to return to the Eaſt; and the death of Damaſus haſtened the execution of his purpoſe; and in 385 he embarked on board a ſhip bound for Antioch. From Antioch he went to Jeruſalem, where he pretends to have been witneſs to a number of miracles, which have gained little credit either among Proteſtants or reſpectable Catholics. In Egypt he attended the lectures of the learned Didymus, and he viſited the monaſteries in the deſert of Nitria. In 385 he ſettled at Bethlehem, where he was joined by Paula and other ladies who had followed him from Rome, as well as by many other perſons of both ſexes, who admired his piety, and who were attached to his ſtrict diſcipline. At Bethlehem Paula founded a church and four monaſteries, one for men, which was committed to the ſuperintendance of Jerome, and three for women, over which ſhe herſelf preſided. In this ſituation he employed his talents and learning to many uſeful purpoſes, in the education of ſeveral young perſons of rank, and in the compoſition of various works, that reflect honour on his name and memory: and he might have been as happy as he was uſeful, if he had not indulged an intemperate deteſtation of the opinions of Origen, and engaged in numerous ardent conteſts with thoſe who defended and propagated them. In 410 the monaſtery of Jerome afforded an aſylum to many of thoſe fugitives who ſought relief in the Holy Land from the ravages of the Goths, who laid Italy waſte, and beſieged Rome; but ſuch was the unjuſtifiable bigotry of his temper, that he excluded all who favoured the opinions of Origen from a ſhare in his hoſpitality: At Bethlehem Jerome terminated his life in the year 420.

Few will be inclined to diſpute Jerome's title to the character of being the moſt learned of all the Latin fathers. This title is evinced by the teſtimony of the beſt judges, and by the numerous works of which he was the author. His judgment, however, was not ſound and diſcriminating; nor was his reaſoning perſpicuous and accurate; and his ſtyle has been juſtly repreſented as more declamatory than argumentative. But the acrimony of his temper, and the total want of candour that appears in his controverſial writings, throw a dark ſhade over all his other good qualities. "His complexion," ſays Moſheim, "was exceſſively warm and choleric; his bitterneſs againſt thoſe who differed from him extremely keen; and his thirſt of glory inſatiable. He was ſo prone to cenſure, that ſeveral perſons, whoſe lives were not only irreproachable, but even exemplary, became the objects of his unjuſt accuſations." The learned Cave ſays, "he was a very hot and furious man, who exerciſed no command over his paſſions. When once provoked, he treated his adverſaries in the rougheſt manner, and did not even abſtain from invective and ſatire; witneſs what he has written againſt Rufinus, who was once his friend, John of Jeruſalem, Jovinian, Vigilantius, and others. Upon theſe men, when they gave him the ſlighteſt provocation, he poured forth a torrent of all the abuſive terms which he could deviſe, without any regard to their perſons, dignity, or learning." His behaviour to the Origeniſts; his declaration principally reſpecting ſuch, "we receive and entertain all ſtrangers without regard to merit; none are excepted but heretics;" and his other declaration in his controverſy with Rufinus, "let us but have the ſame faith, and we are reconciled," preclude the charge of want of candour, if we ſay that Jerome would not have confined himſelf to the mere abuſe and invective of words, if he had been entruſted with power. There is but a ſtep between ſtarving heretics in diſtreſs, and tying them to the ſtake. None can approve of the high terms in which he extols celibacy and virginity, ſo as to ſeem to diſparage the marriage ſtate; and of his culpable credulity we have ample evidence. The candid Lardner, without diſguiſing or condemning the charges which have been alleged againſt him upon the beſt authority by others, allows him to bear teſtimony in his own favour, and he acquits him from the imputation of vanity: thus he ſpeaks of himſelf in various paſſages collected from his works: "That he had been from the beginning diligent and inquiſitive; that all his days he had been employed in the ſchools of rhetoricians and philoſophers, or in reading the ſcriptures of the Old and New Teſtament; that, beſide Latin and Greek, he had endeavoured to make himſelf maſter of Hebrew; that he did not rely upon his own judgment and underſtanding in interpreting the ſcriptures, but conſulted other commentators, and was willing to improve by their labours; that he never thought himſelf too old to learn, but embraced all opportunities of increaſing in knowledge; that he was not employed, as many monks were, in making baſkets of ruſhes, and ſkreens of palm-leaves, to get a livelihood, but in ſtudying the ſcriptures, and putting out correct editions of them."

Of all the productions of Jerome, the moſt uſeful are his interpretations of the ſacred ſcriptures, and thoſe of his letters, which contain critical remarks and diſſertations on particular texts in the bible. The principal of his works, which are enumerated by Cave and Dupin, are, a new Latin verſion of the whole "Old Teſtament," from the Hebrew, accompanied with a corrected edition of the ancient verſion of the "New Teſtament," which, after having been at firſt much oppoſed, was adopted by the Catholic church, and is commonly diſtinguiſhed by the appellation of "Vulgate," which ſee; "Commentaries" on moſt of the books of the Old and New Teſtament; "A Treatiſe on the Lives and Writings of Eccleſiaſtical Authors;" "A Continuation of the Chronicle of Euſebius;" moral, critical, hiſtorical, and miſcellaneous "Letters." The firſt printed edition of his works was that at Baſil, under the care of Eraſmus, 1516—1526, in ſix vols. folio, of which there have been ſeveral ſubſequent impreſſions at Lyons, Rome, Paris, and Antwerp. The moſt correct edition is that of Paris, by Father Martianay, a Benedictine monk of the congregation of St. Maur, 1693—1706, in five vols. fol. Cave, H. L. vol. i. Dupin. Moſheim. Jortin's Rem. E. H. b. ii. pt. ii. Lardner's Works, vol. v. Gen. Biog.

In Jerom's works many particulars occur relative to the muſic of his time, and the chants of the church, eſpecially in his commentary on the epiſtle to the Epheſians, ch. v. ver. 19. p. 652, where there is a memorable paſſage in favour of eccleſiaſtical ſinging: "Speaking to yourſelves in pſalms and hymns, and ſpiritual ſongs, ſinging and making melody in your heart to the Lord," cries out, "Audiant hæc adoleſcentuli: audiant hi quibus pſallendi in eccleſia officium eſt, Deo non voce, ſed corde cantandum: nec in Tragœdorum modum guttur et fauces dulci medicamine colliniendas, ut in eccleſia theatrales moduli audiantur et cantica, ſed in timore, in opere, in ſcientia ſcripturarum."

JEROME *of Prague*, ſo called from the name of the city in which he was born, devoted his youth to the purſuit of knowledge, which he ſought after in all the more conſiderable cities of Europe; particularly in thoſe of Prague, Paris, Heidelberg, Cologn, and Oxford. In the four former univerſities he was admitted to the degree of M.A., and in one of them to that of D.D. in the year 1399. At the latter place he became acquainted with the works of Wickliff, many of which he tranſlated into his native language. Upon his return to Prague, in the year 1400, he openly avowed himſelf a follower of Wickliff, and became attached to Huſs, who was at the head of the party in Bohemia, which had eſpouſed the doctrines of the Britiſh reformer. Jerome, though ſuperior to Huſs in abilities and learning, was not ſo well qualified as the leader of a party, becauſe, with all his great and good qualities, he wanted that gentle, conciliatory temper for which Huſs was diſtinguiſhed. They both concurred, however, in ardent efforts for reſtraining the deſpotiſm of the papal court, and reforming the licentiouſneſs of the clergy. In the year 1410 he was invited by the king of Poland to regulate the univerſity at Cracow; from Poland he went to Hungary, in which country he was accuſed of hereſy; and upon his removal to Vienna he was impriſoned on account of his opinions, but obtained his liberty in conſequence of the ſolicitation of the univerſity of Prague. As ſoon as he heard that his friend Huſs was at Conſtance, ready to appear before the Council, he pathetically exhorted him to maintain a firm and unyielding temper in this great trial, and ſtrenuouſly to inſiſt upon the corrupt ſtate of the clergy, and the neceſſity of reformation, aſſuring him, at the ſame time, that if he ſhould receive information in Bohemia, that his adverſaries were likely to overpower him, he would immediately repair to Conſtance, and give him every kind of aſſiſtance in his power. Huſs earneſtly diſſuaded him from the execution of his purpoſe, as equally unprofitable to him and dangerous to Jerome himſelf; but he was invincible, and arrived at Conſtance on the fourth of April, 1415, about three months before the death of Huſs. Although he entered the town privately, his viſit and the deſign of it was ſoon made public; and he was informed by his friends that he could be of no ſervice to Huſs, and that the council, ſo far from being diſpoſed to hear him, intended to ſeize him. In theſe circumſtances he thought it moſt prudent to retire, and accordingly withdrew to Iberling, an imperial town about a mile from Conſtance. From this place he addreſſed a letter to the emperor, profeſſing his readineſs to appear before the council, if that prince would give him a ſafe-conduct. But Sigiſmund had the honeſty to refuſe. Jerome then tried the council, but could obtain no favourable anſwer. In this ſtate of perplexity he poſted papers in all the public places of Conſtance, avowing himſelf prepared to appear at Conſtance in defence of his character and doctrine, which had been much defamed; and alſo his reſolution to retract every error that ſhould be proved againſt him, on condition that the faith of the council might be pledged for his ſecurity. As he received no anſwer to theſe papers, he ſet out on his return to Bohemia, carrying with him a certificate ſigned by ſeveral of the Bohemian nobility then at Conſtance, which teſtified that he uſed all poſſible means, which prudence ſuggeſted, in order to procure a hearing. At a village, upon the borders of the Black Foreſt, Jerome fell by accident into company with ſome prieſts, and a converſation occurring with reference to the council of Conſtance, Jerome became warm, and among other ſevere things he called that aſſembly the "ſchool of the devil," and "a ſynagogue of iniquity." The prieſts, incenſed by this language, informed againſt him to the chief magiſtrates, by whom he was arreſted and delivered into the hands of the duke of Sultzbach. The duke, having Jerome in cuſtody, wrote to the council for directions; and he was deſired to ſend his priſoner immediately to Conſtance. The elector-palatine then met him, and conducted him in triumph to the town; himſelf riding on horſeback, with a numerous retinue, who led Jerome, in fetters, by a long chain, after him. As ſoon as he was brought before the council, the clamour againſt him became loud and tumultuous; and among others, who diſgraced themſelves on this occaſion, was John Gerſon, chancellor of the univerſity of Paris, one of the moſt learned, as well as the moſt knowing men of his time, but deſtitute of that candour which uſually attends knowledge. In the chancellor's invective and reproach the rectors of the univerſities of Cologn and Hiedelberg concurred; but Jerome had no opportunity of replying. A thouſand voices burſt out from every quarter, "Away with him! burn him! burn him!" After an interval of about half an hour the tumult partly ſubſided; and Jerome, availing himſelf of a momentary pauſe, looked round the aſſembly with a noble air, and cried out aloud, "Since nothing can ſatisfy you but my blood, God's will be done." He was then carried from the aſſembly into a dungeon, under the cuſtody of a guard. Whilſt he was ruminating upon his approaching fate in this cell, he heard a voice addreſſing him in theſe words, "Fear not, Jerome, to die in the cauſe of that truth, which, during thy life, thou haſt defended." "Whoſoever thou art," replied the intrepid priſoner, directing his eyes to the window from which the voice ſeemed to proceed, "who deigneſt to comfort an abject man, I give thee thanks for thy kind office. I have indeed lived defending what I thought the truth: the hardeſt taſk yet remains, to die for its ſake; but God, I hope, will ſupport me againſt fleſh and blood." The guard was alarmed, and Maddonwitz, who had rendered ſervices to Huſs, was diſcovered to be the offender. This incident was a pretence for a more ſevere treatment of Jerome, who was immediately conveyed to a ſtrong tower, where, his hands being tied behind his neck, he was left to languiſh in that painful poſture for two days, without any aliment beſides bread and water. Theſe ſeverities were inflicted with the deſign of forcing him to make a recantation; and the illneſs which they occaſioned, in the courſe of which he urged the council to allow him a confeſſor, afforded an opportunity of preſſing him with arguments to this purpoſe. Jerome, however, remained immoveable. A ſimilar attempt was made upon him immediately after the death of Huſs; but he was ſtill invincible. However, though he was not to be ſubdued by the ſimple fear of death, impriſonment, chains, hunger, ſickneſs, and even torture, through a ſucceſſion of many months, was too great a trial for human nature. Three times was he brought before the council, and carried back to the horrors of his dungeon, before his enemies could prevail againſt him. At length he began to waver; and on the 23d of September, a fatal day, which he recollected with ſhame and grief, he read a loud and ample recantation of all the opinions he had maintained, couched in words directed by the council. In this paper he acknowledged the errors of Wickliff and Huſs, entirely aſſented to the condemnation of the latter, and declared himſelf, in every article, a firm believer with the church of Rome. Having thus acted againſt his conſcience, he retired from the council with a heavy heart. His chains, indeed, were taken away; but the load was transferred from his body to his mind. Vain were the careſſes of thoſe about him: they only mocked his ſorrow. His priſon was now indeed a gloomy ſolitude. The anguiſh of his own thoughts had made it ſuch. Paletz and Du Caſſis, the chief managers againſt him, ſoon perceived this change; and they determined to bring him to a new trial. Several perſons, however, and particularly the cardinals of Cambray and Florence, objected to a new trial. But their endeavours were ineffectual, a torrent of zeal and bigotry bore down all oppoſition; and even the learned Gerſon again diſgraced himſelf by joining in the tumultuous clamour; with great indecency employing his pen, as well as his tongue, upon this occaſion. This kind of agitation continued for half a year: ſo that it was not till May in the year 1416, when Jerome was called again before the council. The proſpect afforded him pleaſure, and he rejoiced at an opportunity of acknowledging publicly that ſhameful defection, which hung ſo heavy upon him. The chief articles alleged againſt him were, his adherence to the errors of Wickliff—his having had a picture of that heretic in his chamber, arrayed in the common ornaments of a ſaint—his counterfeiting the ſeal of the univerſity of Oxford in favour of Wickliff—his deſpiſing the authority of the church after excommunication—and his denial of tranſubſtantiation. Having proteſted his innocence, and given a circumſtantial detail of his coming to Conſtance, and of all that had ſince befallen him, he raiſed his voice, and having expreſſed himſelf with ſome aſperity againſt his accuſers, he told them that he was going to lay himſelf more open to them than he had yet done. He then, with great emotion, declared before the whole aſſembly, that the fear of death only had induced him to retract opinions which from his heart he maintained: that he had done injuſtice to the memory of thoſe two excellent men, John Wickliff and John Huſs; whoſe examples he revered, and in whoſe doctrine he was determined to die. He concluded with a ſevere invective againſt the clergy; the depravity of whoſe manners, he ſaid, was now every where notorious. His ſpeech produced a wonderful effect on the whole aſſembly; and many wiſhed that his life might be ſaved. His judges, however, precipitated the paſſing of ſentence; and on the ſame day, or a few days after, he was condemned for having held the errors of Wickliff, and for apoſtatizing. He was then immediately delivered over to the civil power, and, attired with a cap like that with which Huſs had been adorned, he was led to execution. The poſt to which he was chained was hewn into a monſtrous and uncouth figure of Huſs, and ornamented into a ridiculous likeneſs of him. When the wood began to blaze, he ſang a hymn; and when the flames ſcorched him, he was heard to cry out "O Lord God! have mercy upon me!" and a little afterwards, "Thou knoweſt how I have loved the truth." The wind parting the flames, his body, full of large bliſters, exhibited a dreadful ſpectacle to the beholders; his lips continued ſtill moving, as if actuated by intenſe devotion. During a full quarter of an hour, he diſcovered the ſigns, not only of life, but of intellect. Even his enemies thought the rage of his judges purſued him too far, when they ſaw his wretched coverlet, and the other miſerable garniture of his priſon, by their order, conſumed in the fire after him; and his aſhes, as thoſe of Huſs had been, thrown into the Rhine.

The celebrated Poggio of Florence was preſent at the trial of Jerome, and in a letter to his friend Leonard Aretine, has given an intereſting account of it. For the whole letter we refer to Shepherd's life of Poggio Bracciolini, and for ſeveral extracts to Gilpin's life of Jerome. "It was indeed amazing," ſays this celebrated writer, "to hear with what force of expreſſion, with what fluency of language, and with what excellent reaſoning he anſwered his adverſaries ; nor was I leſs ſtruck with the gracefulneſs of his manner ; the dignity of his action ; and the firmneſs and conſtancy of his whole behaviour."—" Here," ſaid Jerome," as cited by this writer, ſtanding in the midſt of the aſſembly, " here is juſtice ; here is equity. Beſet by my enemies ; I am already pronounced a heretic ; I am condemned, before I am examined.—Were you Gods omniſcient, inſtead of an aſſembly of fallible men, you could not act with more ſufficiency. Error is the lot of mortals ; and you, exalted as you are, are ſubject to it. But conſider, that the higher you are exalted, of the more dangerous conſequence are your errors.—As for me, I know I am a wretch below your notice : but at leaſt conſider, that an unjuſt action, in ſuch an aſſembly, will be of dangerous example." When Jerome was accuſed of hating and defaming the holy ſee, the pope, the cardinals, the prelates, and the whole eſtate of the clergy, he ſtretched out his hands, and ſaid, in a moſt moving accent, " On which ſide, reverend fathers, ſhall I turn me for redreſs ? whom ſhall I implore ? whoſe aſſiſtance can I expect ? which of you hath not this malicious charge entirely alienated from me ? which of you hath it not changed from a judge into an inveterate enemy ?—It was artfully alleged indeed ! Though other parts of their charge were of leſs moment, my accuſers might well imagine, that if this were faſtened on me, it could not fail of drawing upon me the united indignation of my judges."

On the third day of this memorable trial, what had paſt was recapitulated ; when Jerome, having obtained leave, though with ſome difficulty, to ſpeak, began his oration with a prayer to God ; whoſe divine aſſiſtance he pathetically implored. He then obſerved, that many excellent men, in the annals of hiſtory, had been oppreſſed by falſe witneſſes, and condemned by unjuſt judges. Beginning with profane hiſtory, he inſtanced the death of Socrates, the captivity of Plato, the baniſhment of Anaxagoras, and the unjuſt ſufferings of many others. He then inſtanced the many worthies of the Old Teſtament, in the ſame circumſtances, Moſes, Joſhua, Daniel, and almoſt all the prophets ; and laſtly, thoſe of the New, John the Baptiſt, St. Stephen, and others, who were condemned as ſeditious, profane, or immoral men. An unjuſt judgment, he ſaid, proceeding from a laic was bad ; from a prieſt, worſe ; ſtill worſe from a college of prieſts ; and from a general council, ſuperlatively bad.—Theſe things he ſpoke with ſuch force and emphaſis, as kept every one's attention awake.

" The perjured witneſſes," ſaid Jerome, " who have appeared againſt me, have won their cauſe ; but let them remember they have their evidence once more to give before a tribunal, where falſhood can be no diſguiſe."

" His voice," ſays Poggio, " was ſweet, diſtinct, and full : his action every way the moſt proper, either to expreſs indignation, or to raiſe pity ; though he made no affected application to the paſſions of his audience. Firm and intrepid he ſtood before the council ; collected in himſelf ; and not only contemning, but ſeeming even deſirous of death. The greateſt character in ancient ſtory could not poſſibly go beyond him. If there is any juſtice in hiſtory this man will be admired by all poſterity.—I ſpeak not of his errors : let theſe reſt with him. What I admired was his learning, his eloquence, and amazing acuteneſs. God knows whether theſe things were not the ground-work of his ruin.

" With a cheerful countenance, and more than Stoical conſtancy, he met his fate ; fearing neither death itſelf, nor the horrible form in which it appeared. When he came to the place, he pulled off his upper garment, and made a ſhort prayer at the ſtake ; to which he was ſoon after bound, with wet cords, and an iron chain ; and incloſed as high as his breaſt with faggots.

" Obſerving the executioner about to ſet fire to the wood behind his back, he cried out, ' Bring thy torch hither. Perform thy office before my face. Had I feared death, I might have avoided it.'

" As the wood began to blaze, he ſang an hymn, which the violence of the flames ſcarcely interrupted.

" Thus died this prodigious man. The epithet is not extravagant. I was myſelf an eye-witneſs of his whole behaviour. Whatever his life may have been, his death, without doubt, is a noble leſſon of philoſophy." See BRACCIOLINI.

JEROME DE SANTA FÉ, a learned Spaniſh Jew in the fifteenth century, whoſe original name was Joſhua Larchi. He became a Chriſtian, and upon his baptiſm changed his name for that under which he has been juſt deſcribed. He was phyſician to Peter de Luna, who was choſen pope by the cardinals at Avignon in oppoſition to Boniface IX., and took the name of Benedict XIII. When this pontiff was in Spain, in the year 1412, he ordered a public conference to be held between ſome learned Chriſtians at Tortoſa, and the moſt celebrated Jewiſh rabbis in Arragon and Catalonia, on the ſubject of the Meſſiah's character, and the evidence brought forwards to prove that Jeſus of Nazareth was that perſon : on this occaſion Jerome acquitted himſelf with credit to his own learning and abilities, and to the new faith which he had embraced. In the following year he preſented to the pope a treatiſe in confutation of the errors of the Jews, and another againſt the Talmud, which are ſaid to have produced ſuch an impreſſion upon the Jews, that more than five thouſand became Chriſtians. They were publiſhed at Frankfort under the title of " Hebræo-magiſtis," in the year 1602.

JEROM'S *Channel, St.*, in *Geography*, an inlet in the ſtraits of Magellan, which branches off to the N.N.W. about 20 miles in length, forming a communication between the Straits and Indian ſound.

JEROM'S *Point, St.*, a cape on the coaſt of Patagonia, in the ſtraits of Magellan, forming the W. point of entrance into St. Jerom's channel ; 11 miles E. of cape Quad.

JERONIMO DE TAOS, *St.*, a town of New Mexico, on the Brava ; 62 miles N. of Santa Fé.

JERONYMITES, or HIERONYMITES, a denomination given to divers orders, or congregations of religious ; otherwiſe called *Hermits of St. Jerom.*

The firſt, called *Hermits of St. Jerom* of Spain, owe their origin to the third order of St. Francis, whereof the firſt Jeronymites were members. Gregory the eleventh confirmed this order under the name of St. Jerom, whom they had choſen for their patron, and their model ; and gave them the conſtitutions of the convent of St. Mary of the Sepulchre, with the rule of St. Auguſtine ; and for habit, a white tunic, with a ſcapulary, a little capuche, and a mantle, all of their natural colour, without dyeing, and of a mean price.

The Jeronymites are in poſſeſſion of the convent of St. Laurence, in the Eſcurial, where the kings of Spain are buried.

In Spain there is likewiſe an order of nuns of St. Jerom, founded by a lady towards the cloſe of the 15th century. Sixtus put them under the juriſdiction of the Jeronymites, and gave them the conſtitutions of the monaſtery of St. Martha of Cordova; which were afterwards changed by Leo X. for thoſe of the order of St. Jerom.

Hermits of St. Jerom, of the Obſervance, or *of Lombardy*, were founded by Lupus d'Olmedo in 1424, in the mountains of Cazalla, in the dioceſe of Seville.

The third order of Jeronymites was founded by Peter Gambacorti, about the year 1377; but the vows they made were only ſimple, till 1568, when Pius V. appointed them to be ſolemn. They have houſes in Tyrol, Italy, and Bavaria.

The fourth congregation of Jeronymites, are the *Hermits of St. Jerom of Fiezoli*, begun in 1360, when Charles de Montegraneli, of the family of the count of that name, retiring into ſolitude, firſt eſtabliſhed it at Verona. It was approved by Innocent VII. under the title and conſtitutions of St. Jerom. But Eugenius IV. changed it for that of St. Auguſtine. As the founder was of the third order of St. Francis, they preſerved that habit; but, in 1460, Pius, permitting ſuch as pleaſed to change it, occaſioned a diviſion among them. This order was finally ſuppreſſed by Clement XI. in 1668.

JEROPOTAMO, in *Geography*, a river of Candia, anciently "Lathæus," which runs into the Mediterranean, 8 miles N.N.W. of cape Metala.

JERSEY, an iſland in the Britiſh Channel, N. lat. 49° 25′. W. long. 2° 11′, ſituated about four leagues from the coaſt of Normandy, and 25 from that of England. It is conſidered as belonging to Hampſhire, and comprizes an area of 12 miles in length by ſix in breadth; forming about 72 ſquare miles, Engliſh meaſure. The iſland is divided into 12 pariſhes (having only eight churches), ſubordinate to the ſee of Wincheſter, and contains the two towns of St. Helier's and St. Aubin's. The population of the iſle amounts to about 20,000, of which 3000 are able to bear arms, and are formed into two regiments. The ſhores abound with rocks and quickſands. On the northern ſide the cliffs are from 40 to 50 fathoms in height; but the ſouthern ſhore is nearly level with the ſea. A mountainous range runs through the centre, the ſides of which abound with orchards; from the produce large quantities of cyder are made annually. It is computed that 24,000 hogſheads have been made in one year. This propenſity of the inhabitants for cyder has occaſioned them to convert their arable lands into orchards; and hence they have been obliged to import corn from the Baltic, England, and, in times of peace, from France. Formerly they raiſed enough, not only for home conſumption, but for exportation. An abundance of cattle and ſheep are reared here; and native wool forms an important article for trade and manufacture. There were formerly five monaſtic foundations in the iſland. All the acceſſible parts of the coaſt are well fortified with batteries, watch towers, &c. The latter have embraſures for ſmall cannon, and loopholes for muſketry. St. Aubin's bay is guarded by two very ſtrong caſtles, or forts. Theſe, and the whole military government of the iſland, are under the controul of a governor, an officer nominated by the Engliſh miniſtry. The civil juriſdiction is veſted in a bailiff and 12 jurors, who are regulated by local laws chiefly derived from the ducal cuſtoms of Normandy. Jerſey, Guernſey, Sark, and Alderney, were formerly part of the duchy of Normandy; and, though now united to the Britiſh crown, ſtill preſerve many Norman cuſtoms and laws. The legiſlature of England cannot enforce any law here unleſs it has previouſly been ſanctioned by the bailiff and jurors. Some of the Jerſey merchants employ ſeveral veſſels in the Newfoundland trade. The French language is generally ſpoken here, and this is moſtly uſed both in the pulpit and at the bar. Elizabeth caſtle, the principal fort of the iſland, was begun by queen Elizabeth, and hence its name. King Charles I. enlarged it; and king Charles II. who was twice here, increaſed and completed it. The governor and garriſon now reſide here, and the whole occupies an iſland in St. Aubin's bay. Mount-Orgeuil caſtle was a place of ſtrength before Henry the Fifth's reign, and was a fortreſs of very conſiderable conſequence in the time of Edward III. This was alſo ſtrengthened by queen Elizabeth. It ſtands on an eminence which is aſcended by 200 ſteps. From the top may be ſeen the cathedral of Conſtance. This iſland is ſaid to have abounded with druidical temples and altars. Bindaxtro, who wrote ſome tracts concerning Jerſey, and died in 1691, ſtates, that there "were not leſs than 50 of theſe temples and altars in the iſland," of which the greater part were deſtroyed when Falle wrote his hiſtory. The Cromlechs are here called Pouquelays. In Camden's Britannia, vol. iii. p. 751, edit. 1789, is an extract of a letter from Mr. Morant to Dr. Stukeley, giving an account of ſeveral of theſe remains; and in Groſe's Antiquities is a particular deſcription, with two plates, of a very ſingular circular temple, which was found covered over with earth near the town of St. Helier. This was removed to Park Place, Berkſhire, by general Conway, who was governor of the iſland when it was found.

In January 1781, the French, under baron de Rullicourt, landed here, and took poſſeſſion of the garriſon, the governor, &c. Major Pierſon, the ſecond in command, attacked the French, and ſo deſperate was the conflict that both of the commanders were killed, but the invaders were compelled to ſurrender as priſoners of war. Falle's Account of Jerſey. Camden's Britannia. Groſe's Antiquities of England.

Jersey, *New*, one of the United States of America, ſituated between 39° and 41° 24′ N. lat. and between the meridian of Philadelphia and 1° E. long.; and bounded E. by Hudſon river and the ſea; S. by the ſea; W. by Delaware bay and river, which divides it from the ſtates of Delaware and Pennſylvania; N. by a line drawn from the mouth of Mahakkamak river, in lat. 41° 24′ to a point on Hudſon river in lat. 41°. This province is 160 miles long and 52 broad, and contains about 8320 ſquare miles, or 5,324,800 acres. It is ſaid to have been firſt diſcovered by capt. Hudſon, who, in 1609, entered into the ſervice of the Dutch, by whom it was firſt ſettled, about the year 1614. Its original inhabitants were a tribe of Indians, who called themſelves Linnellinopes; by the French they were denominated Les Loups, and by the Engliſh, Delawares. This confederacy compriſed numerous ſubordinate clans, of which the principal were the Chihocki, who dwelt on the W. ſide of the river Delaware; the Wanami, who ranged from the Raritan in New Jerſey to the ſea-coaſt; the Munſeys, on the upper ſtreams of the Delaware, down to the Leheigh; the Wabingas, or river Indians, who reſided between the Delaware and Hudſon, and from the Kittatany to the Raritan; and the Mohickons or Mankattans, who occupied Staten iſland, York iſland, and part of Long iſland, from the highlands to the ocean. Theſe confederate tribes waged war for the greateſt part of a century with the Iroquois, or five nations, but were at laſt ſubdued, and reduced to the moſt humiliating terms, about the year 1682, when William Penn landed in Pennſylvania.

This province formed a part of a large tract of country called New Belgium, or New Netherland; and being ceded to the Engliſh, it was granted, in 1664, by Charles II. to his brother James, duke of York, who made it over to lord Berkeley and ſir George Carteret. After ſeveral diviſions and transfers, which were ſources of quarrels and confuſion, the proprietors, in the year 1702, ſurrendered their charter to the crown, and the country was united to the government of New York. In 1706 Jerſey was made a ſeparate government. New Jerſey is now divided into 13 counties, which are ſubdivided into 94 precincts or townſhips, as in the annexed table,

TABLE.

TABLE.

	Counties.	Principal Towns.	Length.	Breadth.	Total Number of Inhabitants.	Number of Slaves.
These ſeven counties lie from S. to N. on Delaware river. Cape May and Glouceſter extend acroſs to the ſea.	Cape May	None	30	9	571	141
	Cumberland	Bridgetown	50	20	8,248	120
	Salem	Salem			10,437	172
	Glouceſter	Woodbury and Glouceſter	30	22	13,360	191
	Burlington	Burlington and Bordentown	60	30	18,095	227
	Hunterdon	Trenton	37	12	20,253	1,301
	Suſſex	Newtown			19,500	439
These four counties lie from N. to S. on the eaſtern ſide of the ſtate.	Bergen	Hackinſak			12,601	2,301
	Eſſex	Newark and Elizabeth town			17,785	1,171
	Middleſex	Amboy and part of Brunſwic			15,956	1,318
	Monmouth	Freehold	80	30	16,918	1,596
	Somerſet	Boundbrook and part of Brunſwic			12,296	1,810
	Morris	Morriſtown	25	20	16,216	636
Total,	Thirteen.				184,139	11,423

The militia of this ſtate in 1793 amounted to 19,077, between the ages of 18 and 45 years; and the whole number of men capable of bearing arms amounted to between 30 and 40,000. The government of this ſtate is veſted in a governor, choſen annually by the council and aſſembly jointly, a legiſlative council compoſed of one member from each county, choſen annually by the people and general aſſembly, compoſed of three members choſen as above. The governor ſits in and preſides over the legiſlative council; his privy or executive council conſiſts of any three members of the legiſlative council; and the governor and any ſeven members of the council are a court of appeal in the laſt reſort as to points of law in civil caſes, and poſſeſs a power of pardoning criminals in all caſes whatever. The council may originate any bills, excepting preparing and altering any money bill, which is the ſole prerogative of the aſſembly. Every bill is read three times in each houſe. None of the judges of the ſupreme court, or other courts, ſheriffs, or any perſon poſſeſſing any poſt of profit under the governor, juſtices of peace excepted, is entitled to a ſeat in the aſſembly. The courts of juſtice in this ſtate are juſtices' courts, courts of quarter-ſeſſions of the peace, courts of common-pleas, ſupreme courts, orphans' courts, courts of chancery, and high court of errors and appeals. The Engliſh laws, as far as they are not repugnant to revolution principles, are adopted by the conſtitution; but in the diſtribution of property, where there is no will, each ſon has two ſhares, and each daughter has one ſhare. In this ſtate there are about 50 Preſbyterian congregations, ſubject to the care of three preſbyteries: *viz.* thoſe of New York, New Brunſwick, and Philadelphia. Beſides theſe there are upwards of 40 congregations of Friends, 30 of the Baptiſts, 25 of Epiſcopalians, 28 of Dutch Reformers, 20 of the Methodiſts, and a ſettlement of Moravians. All are allowed by the conſtitution to worſhip God according to the dictates of their own conſciences; and are not compelled to attend or ſupport any worſhip contrary to their own faith and judgment. All Proteſtant inhabitants, of peaceable behaviour, are eligible to the civil offices of the ſtate. For the colleges in this ſtate, ſee College. The capital town of this province is Trenton; beſides which there are Burlington, Perth Amboy, Brunſwick, Elizabethtown, Newark, Swedeſborough, Salem, &c. which ſee reſpectively. The rivers in this ſtate, though not large, are numerous; the principal are the Paſſaik, Raritan, Hackinſack, Delaware, Cohanſey creek, Mulicus, Alloway creek, Ancocus creek, Paulin's Kiln, Racoon creek, Salem creek, and ſome others. This ſtate is remarkable for mill-ſeats, 1100 of which are already improved; 500 with flour-mills, and the reſt with ſaw-mills, fulling-mills, forges, furnaces, ſlitting and rolling-mills, paper, powder, and oil-mills. The greateſt part of the ſoil of New Jerſey is ſandy; ſome of it barren and unfit for cultivation; but that near the ſea-coaſt is ſaid to be many feet deep, in ſome places 50, without rocks or ſtones, when you come to ſalt-marſh, and has much the appearance of being artificial; the good land in the ſouthern counties lies principally on the banks of rivers and creeks; the ſoil on theſe banks being generally a ſtiff clay, which, in its natural ſtate, produces various ſpecies of oak, hickory, poplar, cheſnut, aſh, &c. The barren parts produce little elſe but ſhrub-oaks and yellow pines. Theſe ſandy lands yield an immenſe quantity of bog-iron ore, which is wrought very advantageouſly in the iron-works in theſe counties. The ſalt meadows along the lower part of the Delaware river and bay afford plentiful paſture for cattle in ſummer, and hay in winter; but the ſwarms of muſkitoes in the months of June, July, and Auguſt, are very troubleſome both to man and beaſt. The inhabitants along the ſea-coaſt ſubſiſt principally by feeding cattle on the ſalt-meadows, and by various kinds of fiſh, abundantly ſupplied by the ſea, rivers, and creeks. They raiſe Indian corn, rye, potatoes, &c. but not for exportation. Their ſwamps afford lumber, which is conveyed with eaſe to a good market. The ſugar maple-tree is common in Suſſex county, upon the Delaware. In the hilly and mountainous parts of the ſtate, which are not too rocky for cultivation, the ſoil is of a ſtronger kind, covered, in a ſtate of nature, with ſtately oaks, hickories, cheſnuts, &c. and when cultivated, producing wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and farmers feed great numbers of cattle for the markets of New York and Philadelphia; and many of them keep large dairies, as there are large tracts of fine meadows between the hills. The orchards in many parts of the ſtate are ſaid to be equal to any in the United States, and the cider is reckoned the beſt in the world. Thoſe parts of New Jerſey that are contiguous to New York and Philadelphia, ſupply their markets with many kinds of vegetables, as apples, pears, peaches, plums, ſtrawberries, cherries, and other fruits; cider in large quantities, and of the beſt quality, butter, cheeſe, beef, pork, mutton, and other meats.

The trade of New Jerſey is carried on almoſt ſolely with New York and Philadelphia; though it has ſome good ports of its own. The articles exported are chiefly wheat, flour, horſes, live cattle, hams which are much commended, lumber, flax-ſeed, leather, iron in great quantities, and formerly copper-ore. The imports conſiſt chiefly of Weſt India goods. The manufactures of this ſtate have been inconſiderable, though they are now improving; and they conſiſt principally of the articles of iron, nails, and leather. Tanneries are numerous and valuable; paper-mills and nail manufactories are wrought with profit in ſeveral parts of the ſtate. Wheat is alſo manufactured into flour, and Indian corn into meal; and theſe are profitable articles. But iron is the moſt ample ſource of wealth to the ſtate. Iron-works are erected in Glouceſter, Burlington, Suſſex, Morris, and other counties. In the whole ſtate it is ſuppoſed there are yearly made about 1200 tons of bar-iron, 1200 ditto of pigs, and 80 ditto of nail-rods, excluſive of hollow ware, and various other caſtings, to a great amount. This ſtate affords vaſt quantities of iron and copper-ore. The iron-ore is of two kinds: one capable of being manufactured into malleable iron, and found in mountains and low barrens; and the other called bog-ore, found in rich bottoms, and yielding iron of a hard, brittle quality, which is commonly manufactured into hollow ware, and uſed ſometimes inſtead of ſtone in building. Many copper-mines have been diſcovered in different parts of the ſtate. Mines have alſo been diſcovered of lead and plaſter of Paris, and the ſtate is ſaid alſo to contain coal. In the town of Newark and its vicinity, there are immenſe quarries of valuable ſtone, much uſed in building.

The inhabitants of this ſtate are a collection of Low Dutch, Germans, Engliſh, Scotch, Iriſh, and New Englanders, or their deſcendants; and of courſe differ much in their manners and character; and this difference is in ſome meaſure increaſed by different forms of religion, and alſo by intercourſe with the inhabitants of other ſtates. The people in Weſt Jerſey trade to Philadelphia, and incline to the faſhions and manners of that city: whilſt thoſe of Eaſt Jerſey trade to New York, and acquire a reſemblance to the inhabitants of this capital. But whatever differences may ſubſiſt among them in conſequence of theſe circumſtances and of their different occupations and profeſſions, the people of New Jerſey are generally induſtrious, frugal, and hoſpitable. The women are allowed to be diſcreet, amiable, genteel, and alſo handſome, in due proportion to their whole number. Morſe's American Univerſal Geography, vol. i. 1805.

Jersey, *New*, in *Botany*. See Ceanothus.

Jersey, among *Woolcombers*, denotes the fineſt wool, taken from the reſt by dreſſing it with a Jerſey comb.

JERTH, in the *Materia Medica*, a name given to a certain kind of moſs, according to Schæffer, growing very plentifully in Lapland, and other cold countries. The root of this is the part uſed in medicine, and the method of giving it is in decoction. They boil a large quantity of it in the whey made of rein-deer's milk, and give the patient large draughts of it warm every hour or two; by that means keeping up a good perſpiration, which they increaſe or diminiſh according to the nature of the caſe. The principal diſeaſes to which they are ſubject are pleuriſies and the ſmall-pox; and it is wonderful to find how well they get through theſe two dangerous complaints by this regimen alone. Upon the whole, the virtue of ſo much warm and diluting liquor ſeems the principal thing to be depended upon by them; for if they cannot readily get the jerth root, they ſcruple not to ſupply its place with the ſtalks of angelica, and the medicine ſeems to ſucceed as well this way as the other, both in the ſmall-pox and other caſes.

JERVAS, Charles, in *Biography*, a portrait painter, whoſe name is more indebted for its reputation to his pupil Pope having offered falſe incenſe to him in a copy of verſes, than to his own merits. He was a pupil of Kneller, and acquired a fortune by marriage. He died in 1739.

JERVIS's Canal, in *Geography*, an inlet or arm of the Pacific ocean, on the W. coaſt of North America, in the gulf of Georgia, examined and ſo named by captain Vancouver in the year 1792. N. lat. 49° 40′. E. long. of the entrance 236° 22′.

JERUSALEM, derived from ראה, *to ſee*, and שלם, *peace*, *q. ſ.* the viſion or inheritance of peace, a celebrated city of Aſia, the capital of Paleſtine or Judea, is ſuppoſed, though perhaps without ſufficient authority, to have been built on the ſcite of Melchizedek's *Salem*, and hence called "Salem" and "Solyma." It was ſituated in the midſt of a rocky and barren country, on the frontiers of the two tribes of Benjamin and Judah, ſo that it was ſometimes conſidered as a part of the one, and ſometimes of the other; but by the diſtribution of Joſhua (ch. xviii. 28.) it belonged to Benjamin, whereas it pertained to Judah by right of conqueſt, this tribe having twice ſubdued it, firſt under the Judges, and afterwards under David. After the building of the Temple, it was conſidered as the metropolis of the nation, belonging to all Iſrael in common, and not properly either to Benjamin or Judah. Jeruſalem was founded upon hills, and ſurrounded by mountains: the two largeſt hills were Zion and Acra, upon which the firſt buildings were erected; and on mount Moriah, Solomon, at a ſubſequent period, built the temple. Mount Zion bounded to the ſouth the whole circumference, and reached from eaſt to weſt: the weſtern ſide was the moſt elevated, and circumſcribed by the valley of Hinnom, or Ge-hinnom, as the eaſtern was by that of Jehoſaphat, which is ſuppoſed to have joined the other towards the ſouth. Here were the fountains of Gihon and Siloam, the brook Kidron, and the waters of Ethan, which Pilate, at a much later period, conveyed through aqueducts into the city. To the north of Zion was another valley, called by Joſephus "the valley of Cheeſemongers," probably the ſame as that diſtinguiſhed in Zephaniah (ch. i. 11.), by the epithet "Machtheſh," which the LXX have tranſlated *την κατακεκομμενην*, *q. d.* that which was cut in or made hollow. Acra, with the ſaid valley to the ſouth, ſtood to the north of Zion, having its declivity on every ſide equal. Upon Zion ſtood the High city, called, in the time of Joſephus, the High Market-place; the Lower city ſtood upon Acra, but before that period bore other names. The ancient city Jebus, which David took from the Jebuſites, was not large: it ſtood on a mountain S. of the temple. When David ſubjected and expelled the Jebuſites, he ſeized their fortreſs and city, B. C. 1048, and called the latter after his own name, "the City of David." Between the mountains, Zion and Acra, on which the Upper and Lower cities were erected, there was a valley, which ſeparated the two cities, but which was filled up by David and Solomon, ſo that the two cities were joined. 1 Kings, ix. 15. 24. xi. 27.

Jeruſalem, in its moſt flouriſhing ſtate, was divided into four parts, each incloſed within its own walls; namely, the old city of Jebus, which ſtood on mount Zion, where the prophets dwelt, and where David built a magnificent caſtle and palace, which became the reſidence both of himſelf and his ſucceſſors; on which account it was emphatically ſtyled "the City of David." The "Lower City," called alſo the "Daughter of Zion," being built after it, on which ſtood the two magnificent palaces which Solomon built for himſelf and his queen; that of the Maccabean princes; and the ſtately amphitheatre raiſed by Herod, capable of containing 80,000 ſpectators; the ſtrong citadel by Antiochus, to command the temple, afterwards razed by Simon the Maccabee, who recovered the city from the Syrians; and laſtly, a ſecond citadel, built by Herod, upon a high and craggy rock, called by him Antonia. The "New City," moſtly inhabited by tradeſmen, artificers, and merchants: and "Mount Moriah," on which appeared the celebrated temple of Solomon, deſcribed in the 6th and 7th chapters of the 2d book of Kings, deſtroyed by Nebuchadnezzar, re-built by the Jews on their return from Babylon, and afterwards renewed, augmented, adorned, and enriched by Herod. See Temple.

Little is ſaid concerning the walls of Jeruſalem. We read, however, that after David had taken "the ſtrong hold of Zion," he called it the city of David, and dwelt in that fort, having built round about Milla and inward. Solomon, from whoſe time the appellation of Jeruſalem ſeems to have ſuperſeded that of Jebus, and his ſucceſſors, took care to improve the walls. Hezekiah built up that part which was demoliſhed by Joaſh, king of Iſrael, and added another without. After the reign of Manaſſeh, there is mentioned a new city, called the "Second," incloſed with walls by that prince. (2 Chron. xxiv. 22. xxxiii. 14. 2 Kings, xxii. 24.) The Maccabees conſiderably enlarged it on the north, by incloſing a third hill, as part of Jeruſalem. Joſephus ſpeaks of a 4th hill, called "Bezetha," which Agrippa joined to the city: this new city lay north of the temple, along the brook Kidron, or Cedron. In ancient Jeruſalem there were ten gates, five from W. to E. by S., and five others by N. Nehemiah mentions alſo four towers. It is not eaſy to aſcertain the extent of this city in its different changes. Its moſt ancient ſtate of perfection was in the reign of Solomon, in whoſe time this city appeared in its greateſt ſplendour. In this ſtate of uncertainty about its limits, we may venture to ſtate its circumference at firſt to have been ſeven or eight ſtadia, or a Roman mile. In Solomon's time it was, without doubt, twice or three times as large. After the captivity, when it was rebuilt, it occupied much the ſame ſpace as before, as we may infer from Nehemiah's deſcription of the ruins, and its condition after it was repaired. According to Joſephus, the whole circumference of Jeruſalem was 33 ſtadia, or about four miles 125 paces. But Hecatæus, who deſcribes it as it was in his time, under Ptolemy Lagus, gives it no leſs than 50 ſtadia, probably including the out-parts, which did not properly belong to it; and Hecatæus adds, that there were in Jeruſalem 120,000 inhabitants; which ſtatement is not improbable. The circumference of the ancient city, according to Euſebius, (Præp. Evang. l. ix. c. 36.) was 27 ſtadia, or 2550 toiſes. A plan, ſays Gibbon, taken on the ſpot, aſſigns no more than 1980 for the modern town. For the different opinions reſpecting its meaſurement, we refer to Villalpendus and Reland.

From the period of the reign of Solomon, when the temple was dedicated, B. C. 1004, to the deſtruction of the city, it underwent many revolutions and viciſſitudes; ſome of the principal of which we ſhall recite. In the fourth year of the reign of Rehoboam, ſon of Solomon, B. C. 971, the city was beſieged and taken by Shiſhak, or Seſac, king of Egypt, who carried away the treaſures of the temple, as well as of the royal palace. In about a century after, B. C. 826, Jehoaſh, king of Iſrael, advanced to Jeruſalem, having taken Amaziah, king of Judah, and plundered the temple and royal palace, and demoliſhed the city-walls. (2 Kings, xiv. 13. 2 Chron. xxv. 23.) In the year B. C. 608, Pharaoh Necho, king of Egypt, having ſlain Joſiah, king of Judah, captured his ſon Jehoahaz, who had been raiſed to the throne in the room of his father, impoſed upon Jehoiakim, appointed by Necho as his ſucceſſor, a tax of 100 talents of ſilver, and 10 of gold, pillaged the city and temple, and thus made Jeruſalem tributary to Egypt. In the 4th year of Jehoiakim, B. C. 606, Nebuchadnezzar beſieged Jeruſalem, which now fell under the dominion of the Chaldeans. When Jehoiakim attempted three years after to throw off the yoke of ſervitude, the king of Chaldea ſent a powerful army againſt him, which deſolated Judea, took Jehoiakim priſoner, and put him to death, carrying away a number of his ſubjects as ſlaves to Babylon. His ſon Jehoiachin, who ſucceeded him, reigned at Jeruſalem only three months. Nebuchadnezzar laid ſiege to Jeruſalem, and compelling Jehoiachin to ſurrender, carried him, his family, and many of the inhabitants captive to Babylon. Upon this occaſion Nebuchadnezzar ſeized on all the riches of the temple and royal palace, and deſtroyed thoſe golden veſſels which Solomon had appropriated to the ſervice of God. In the room of Jehoiachin, Zedekiah was raiſed to the throne; but when this prince rebelled againſt the king of Chaldea, he ſent an army againſt Jeruſalem, which, in the 11th year of Zedekiah, B. C. 588, took the city, and, after putting out his eyes, carried him away as a captive. Nebuchadnezzar, being then at Kiblah, a city of Syria, ſent his general Nebuzaradan utterly to deſtroy Jeruſalem. The walls of the city were razed, the royal palace and temple were demoliſhed, their riches and ornaments tranſported to Babylon, and the people were carried away into ſlavery. Cyrus, king of Perſia, having conquered Babylon in the year B. C. 538, ſet the Hebrews at liberty, and in the year B. C. 536, iſſued an edict for their return to their own land, for a reſtoration of the ſacred veſſels carried away by Nebuchadnezzar, and for the rebuilding of their temple, after a captivity of 70 years, if we reckon from the fourth year of Jehoiakim, B.C. 606. (See Captivity.) The Jews, obſtructed by the Samaritans, and other hindrances, were 20 years employed in conſtructing this new edifice, ſo that it was finiſhed in the year B.C. 515. But the walls and gates were not rebuilt till after the return of Nehemiah, in the ſpace of 12 years and four months, the 82d year after the decree of Cyrus, or B.C. 454. After the time of Nehemiah, Jeruſalem enjoyed peace till the year B.C. 332, when Alexander, having taken Tyre, demanded aſſiſtance of the Jews; and being refuſed by the chief prieſt, who pleaded as an oath made to Darius not to take part with his enemies, the conqueror was incenſed, and repairing to Jeruſalem, determined to be revenged on the city and its inhabitants;

but being met by a multitude of people dreſſed in white, the prieſts arrayed in their robes, and the high prieſt in a garment of purple and gold, having on his head a tiara, with a plate of gold above it, upon which was inſcribed the name of the Lord, his paſſion ſubſided; and approaching the high prieſt, he offered his adoration to God, and paid his reſpects to Jaddua, and ſaluted all the Hebrews. After the death of Alexander, Jeruſalem remained ſubject to the kings of Egypt; Ptolemy Soter, the ſon of Lagus, having taken it by ſtratagem in the year B.C. 320, and having carried into captivity about 100,000 perſons. In the year B.C. 170, Antiochus Epiphanes beſieged Jeruſalem, pillaged the city and temple, put to death 80,000 of the inhabitants, made 40,000 of them ſlaves, and ſold 40,000 more. Three years after, the ſacrifices were interrupted in the temple, the ſtatue of Jupiter Olympius was placed on the altar, and the abomination of deſolation was ſeen in the houſe of God. After three years, Judas Maccabæus went up to Jeruſalem, purified the temple, and reſtored the ſacrifices. In the following year B.C. 164, Antiochus Eupator laid ſiege to Jeruſalem, but a peace being concluded, he was received into the city by Judas Maccabæus; however, he violated his oath, and cauſed the wall between the temple and the citadel, which defended the former from the attacks of the Syrians, to be utterly demoliſhed. In the year B.C. 143, Simon Maccabæus fortified Jeruſalem, by erecting high and ſtrong towers on the walls; and he took and deſtroyed the citadel, which was then in the hands of the Syro-Macedonians, and which had kept Jeruſalem 26 years dependent on the king of Syria. John Hyrcanus ſucceeded his father Simon in the year B.C. 135, and ſoon after Antiochus Sidetes, king of Syria, declared war againſt him, beſieged Jeruſalem, deſtroyed the walls of the city, and then retired, in the year B. C. 63. Pompey, having ſubdued Syria, laid ſiege to Jeruſalem, and made Judea tributary to the Roman empire. But though he and ſome of his officers entered into the moſt holy places of the temples, they took nothing away. During the reign of Herod the Great, Jeruſalem was much enlarged and embelliſhed. He conſtructed a ſuperb royal palace, a theatre, and an amphitheatre, for the purpoſe of celebrating various games in honour of Auguſtus. He alſo projected the deſign of rebuilding the temple, or at leaſt of enlarging that which had been erected after the return of the Jews from the Babyloniſh captivity, and having begun the work in the 18th year of his reign, he completed it in eight years. (See TEMPLE.) Under the reign of the emperor Tiberius, Jeruſalem was made ſignal in all future ages by the death and reſurrection of our Lord and Saviour JESUS CHRIST, who was unjuſtly accuſed and condemned, and crucified on mount Calvary. (See CALVARY.) It is needleſs to recite any of thoſe trivial circumſtances that pertain to this city, between the event now mentioned, and its deſtruction by Titus. The country of Judea, and Jeruſalem in particular, had been reduced to a wretched ſtate by contending factions, and by reſiſtance to the oppreſſion of Roman governors. The diſſatisfaction that prevailed at length terminated in the deſolation and carnage of war. This was commenced, according to Joſephus, (Ant. l. 20. xi. 1.) in the ſecond year of the government of Geſſius Florus, who ſucceeded Albinus, the ſucceſſor of Porcius Feſtus, mentioned in the Acts of the Apoſtles, in the month of May, in the 12th year of the emperor Nero, and the 17th year of Agrippa, mentioned Acts, xxv. and xxvi, that is, in the month of May, A.D. 66. The emperor Nero entruſted the conduct of it, on the part of the Romans, to his general Veſpaſian, who, accompanied by his ſon Titus, and a powerful army, arrived in Syria, A.D. 67. Veſpaſian, ſoon after ſucceeding to the empire, committed the proſecution of the war againſt the Jews to his ſon Titus, who joined the army, amidſt the acclamations of the populace, A.D. 70. Jeruſalem was in the moſt woeful condition when Titus undertook the ſiege of it, April 14th, A.D. 70. Having made himſelf maſter of the firſt wall, May 4th, he cauſed a great part of it towards the north to be demoliſhed. His favourable offer of terms to the beſieged was rejected; and five days after he took the ſecond wall, and after a repulſe, he gained poſſeſſion of it again in four days, and demoliſhed the part that remained of it in the northern quarter. Failing to batter down the third wall, Titus renewed his propoſal to the inhabitants, and for this purpoſe employed Flavius Joſephus, who had been taken priſoner, and who, after having received his liberty, had attached himſelf to the Roman camp. The majority of the people were inclined to accept the eaſy conditions that were propoſed; but they were reſiſted by ſome zealots, and Joſephus was treated with every mark of indignity and reproach. Titus was enraged, and his clemency was changed into unjuſtifiable ſeverity. He ordered the hands of thoſe who had ſought ſhelter in his camp to be cut off, and in this mutilated ſtate ſent them back to the city; and others were crucified in the ſight of their countrymen. Within the city famine began to make dreadful havoc, ſo that parents were obliged to ſatisfy their hunger by devouring the fleſh of their own children; an action which appeared ſo unnatural to the Roman general, that he ſwore he would bury the remembrance of it under the ruins of Jeruſalem. Titus accelerated by all the means in his power the operations of the ſiege, and at length, applying his battering rams to the third wall, or the wall encloſing the fortreſs, he made himſelf maſter of the tower of Antonia. The Romans wiſhed to get poſſeſſion of the temple without deſtroying it; but a ſoldier threw a burning torch amidſt a quantity of combuſtible materials in the northern part of it, and thus ſet it on fire. The temple was burnt on the 18th day of the month of Auguſt, A.D. 70, the ſame day and month, on which it had been burnt by the king of Babylon. The Romans with concern, and the inhabitants with the moſt poignant ſorrow, perceived this building reduced to aſhes; and very ſoon, *viz.* on the 8th day of September, A.D. 70, and in the 2d year of the reign of Veſpaſian, the city of Jeruſalem fell into the hands of Titus. It was then given up to be plundered by the ſoldiers, and moſt of its inhabitants were put to the ſword. In conformity to the orders of Titus, the city was deſtroyed to its foundations, and even the ruins of the temple were demoliſhed. A plough-ſhare, it is ſaid, was drawn over the conſecrated ground, as a ſign of perpetual interdiction. According to Joſephus, whoſe account of the Jewiſh war, and of the ſiege and capture of Jeruſalem, is in almoſt every one's hands, the number of priſoners taken during the whole war was 97,000, and that the number of thoſe who periſhed in the ſiege amounted to 1,100,000; but Tacitus, who lived in the firſt century, in the time of Veſpaſian and Titus, heard it reported, that the number of the beſieged, including thoſe of every age and ſex, was only 600,000. Notwithſtanding the deſtruction of their city, many Jews remained in the town or in its vicinity, and erected new buildings for their accommodation; but they paid tribute to the Romans, and became ſubject to their laws. It is a circumſtance that deſerves to be recorded, that, as we have good reaſon to believe, no Chriſtians were involved in the miſeries of the laſt ſiege of Jeruſalem. They are ſuppoſed to have left it before the ſiege began. Some went to Pella, as Euſebius mentions (H. E. l. iii. c. 5), a city on the other ſide of the Jordan. Others might go elſewhere, into Aſia, or other

other remote countries, where they could get a ſettlement. St. John, it is ſuppoſed, left Judea, and went to Epheſus in the year 66, or about that time, juſt before the war commenced. Some Jews of Jeruſalem, and other parts of Judea, might go with him, or follow him afterwards. And, under his direction and aſſiſtance, they might procure a comfortable ſettlement in places not far from him. After the termination of the war in Judea, it is ſuppoſed that the Chriſtian believers, who had retired into the country beyond Jordan, returned to Jeruſalem, and formed a church there.

In proceſs of time, the Jews incenſed Adrian by their turbulent diſpoſition, and he reſolved to level the city of Jeruſalem with the ground, that is, thoſe buildings which the Jews had erected, to deſtroy three towers that were left by Titus for the convenience of the Roman garriſon, and to ſow ſalt in the ground on which the city had ſtood. Thus did Adrian, whatever were his motives, literally fulfil the prediction of our Saviour, that neither in the city nor the temple ſhould one ſtone be left upon another. This final deſtruction took place 47 years after that of Titus. The further attempts of Adrian are recited under the article ÆLIA *Capitolina*. For an account of the honours paid to Jeruſalem and its vicinity by the mother of Conſtantine the Great, ſee CALVARY, *Invention of the* CROSS, and HELENA. For Julian's attempt to rebuild the temple at Jeruſalem, ſee JULIAN and TEMPLE. The emperor Juſtinian erected a magnificent church to the Virgin Mary at Jeruſalem. For the foundation of this church a level was formed, by raiſing part of a deep valley to the height of the mountain. The ſtones of a neighbouring quarry were hewn into regular forms; each block was fixed on a peculiar carriage drawn by 40 of the ſtrongeſt oxen, and the roads were widened for the paſſage of ſuch enormous weights. Lebanon furniſhed her loftieſt cedars for the timbers of the church; and the ſeaſonable diſcovery of a vein of red marble ſupplied its beautiful columns, two of which, the ſupporters of the exterior portico, were eſteemed the largeſt in the world. To complete the celebrity of this church, the holy veſſels of the Jewiſh temple, recovered by Beliſarius after their long peregrination, ſays Gibbon, were depoſited in it.

In the year 614, the Perſians, under the command of Choſroes, took Jeruſalem by aſſault. The ſepulchre of Chriſt, and the ſtately churches of Helena and Conſtantine, were conſumed, or at leaſt damaged by the flames; the devout offerings of 300 years were rifled in one ſacrilegious day; the patriarch Zachariah, and the “true croſs” were tranſported into Perſia; and the maſſacre of 90,000 Chriſtians is imputed to the Jews and Arabs, who ſwelled the diſorder of the Perſian march. However, in 628, Jeruſalem and the holy croſs were reſtored to Heraclius, who baniſhed from the city all the Jews, and prohibiting their coming within three miles of it. After the battle of Yermuk in 626, and a ſiege of four months, Jeruſalem ſurrendered to the Saracens, under the command of the caliph Omar, and it remained for ſeveral centuries under the government of the caliphs, who were Mahometans, and of courſe the prevailing religion was Mahometan. The Turks, after having reduced Damaſcus by fire and ſword, took poſſeſſion of Jeruſalem A.D. 1076; and under the government of theſe maſters, the condition of the Chriſtians was very deplorable; the pilgrims, who were numerous from all parts of the world, were grievouſly inſulted and oppreſſed by the Turkmans; the pathetic tale of their ſufferings excited the millions of the weſt to march under the ſtandard of the croſs to the relief of the Holy Land. “A nerve,” ſays Gibbon, “was touched of exquiſite feeling; and the ſenſation vibrated to the heart of Europe.” The Turks were conſtrained to ſurrender Jeruſalem to the caliph of Egypt; but after a ſhort poſſeſſion he was obliged to deliver it to the Cruſaders. See CROISADE.

Jeruſalem, long ſo famed in hiſtory for its ſanctity and its opulence, is now reduced to a poor, thinly inhabited town, of at moſt three miles in circuit. It is called by the Turks “Cudſembaric” and “Coudſheriff.” The Orientals, however, never call it by any other name than “Elkods,” the Holy: ſometimes adding the epithet “el ſherif,” the noble. The ground between Rome and Jeruſalem is rugged, mountainous, and barren. When its ſituation is conſidered, deſtitute of water, and ſurrounded by dry channels of torrents and ſteep heights, we may well be aſtoniſhed at its ancient greatneſs. It is ſeated on an eminence, but ſurrounded by others of greater height; and its walls, which remain tolerably perfect, and conſtructed of a reddiſh ſtone, form the chief object in the approach. The beſt view of Jeruſalem is from the mount of Olives, on the eaſt of the city. In front is the chief moſque, which, according to the tradition of the Mahometans, contains the body of Moſes; from the ſame mount may be diſcovered, on a clear day, the “Dead Sea,” nearly S.E., reflecting a whitiſh gleam; the intervening region appearing very rocky. The “tombs of the kings,” as they are called, are worthy of notice, being of Grecian ſculpture on a hard rock. There are ſeveral ornaments on the ſarcophagi of foliage and flowers, and each apartment is ſecured with a maſſive pannelled door of ſtone. Theſe tombs, which have been frequently ravaged in ſearch of treaſure, are ſuppoſed to have been conſtructed in the time of Herod and his ſucceſſors, kings of Judea. The inhabitants are partly Chriſtians and partly Mahometans, and they are actuated by a ſpirit of diſcord and hatred towards one another. From the reſpect which they profeſs for the ſacred places contained in this city, one would be apt to imagine that they were a very devout people; but Volney repreſents them as well deſerving the reputation of the vileſt people in Syria, not excepting even thoſe of Damaſcus. He ſuppoſes their number to amount to 12 or 14,000: Browne ſtates the preſent population of Jeruſalem at from 18 to 20,000. The Chriſtian women, who abound in Jeruſalem, wear white veils, as a diſtinction from the Mahometan, who wear other colours. Arabic is the general language, except among the Armenians and Greeks. Jeruſalem has had from time to time governors of its own, with the title of Pachas: but it is now governed by an aga, motſallam, or deputy governor, appointed by the pacha of Damaſcus, who is allowed ſo few troops, that all Paleſtine may be regarded as in the power of the Arabs. The motſallam, availing himſelf of the diſpoſition to make pilgrimages to Jeruſalem and its vicinity, which has prevailed for many ages, and which ſtill continues, farms his government, and receives the revenues ariſing from the Miri, the cuſtoms, and eſpecially from the follies of the Chriſtian inhabitants. In order duly to appreciate the value of this laſt article, it muſt be underſtood, that the different communions of Schiſmatic and Catholic Greeks, Armenians, Copts, Abyſſinians, and Franks, mutually envying each other the poſſeſſion of the holy places, are continually endeavouring to outbid one another in the price they offer for them to the Turkiſh governors. They are conſtantly endeavouring to obtain ſome privilege for themſelves, or to take it from their rivals; and each ſect is perpetually informing againſt the other for irregularities. Hence proceed thoſe hatreds, and that eternal jangling which prevail between the different convents, and the adherents of each communion. Every diſpute yields profit to the Turks; and alſo perquiſites for the motſallam, which annually amount to upwards of 100,000 piaſtres.

Every pilgrim pays him an entrance fee of ten piaſtres, and another for an eſcort for the journey to the Jordan, beſides other ſums as fines for miſbehaviour during the ſtay of the pilgrims, and duties on the exportation of certain ſingular commodities from Jeruſalem, ſuch as beads, relics, ſanctuaries, croſſes, paſſions, agnus deis, ſcapularies, &c. of which near 300 cheſts are ſent off annually. The fabrication of theſe utenſils of piety procures ſubſiſtence for the greateſt part of the Chriſtian and Mahometan families of Jeruſalem and its neighbourhood; men, women, and children being employed in carving and turning wood and coral, and embroidering in ſilk, with pearls, and gold and ſilver thread. The convent of the Holy Land, alone, lays out annually to the amount of 50,000 piaſtres in theſe wares, and thoſe of the Greeks, Armenians, and Copts, taken together, pay a larger ſum. Theſe commodities, exported to Turkey, Italy, Portugal, and eſpecially to Spain, produce a return of conſiderable ſums, either in the form of alms or payments. To this the convents join another article not leſs lucrative, *viz.* "the viſits of the pilgrims." It is well known that at all times the devout curioſity of viſiting the "holy places" has occaſioned Chriſtians of every country to reſort to Jeruſalem. It was formerly taught by the miniſters of religion as indiſpenſibly neceſſary to ſalvation, and this pious zeal pervading all Europe, gave riſe to the cruſades. (See CROISADES.) Since their unfortunate iſſue, the zeal of Europeans has cooled, the number of pilgrims has diminiſhed, and they are now reduced to a few Italian, Spaniſh, and German monks; but this is not the caſe with the Orientals, their prieſts and monks, deriving advantage from this fervour, do not ceaſe to promote it. The Greeks, eſpecially, declare that "the pilgrimage enſures plenary indulgence, not only for the paſt, but even for the future; and that it abſolves not only from murder, inceſt and pederaſty; but even from the neglect of faſting, and the non-obſervance of feſtivals, which are far more heinous offences." Accordingly, every year a crowd of pilgrims of both ſexes, and of all ages, ſet out from the Morea, the Archipelago, Conſtantinople, Anatolia, Armenia, Egypt, and Syria, the number of whom, in 1784, amounted to 2000. This zeal, however, is found to be very expenſive: ſince the moſt moderate pilgrimage never coſts leſs than 166*l.* and ſome of them, by means of offerings, amount to 2500*l.* Yafa is the port where the pilgrims diſembark; they arrive in November, and repair without delay to Jeruſalem, where they remain, in inconvenient but very expenſive lodgings, till after the feſtival of Eaſter. The pilgrims muſt alſo be at great charge in paying for maſſes, ſervices, and exorciſms, and alſo in the purchaſe of crucifixes, beads, &c. On Palm Sunday they go to purify themſelves in the Jordan, which is an expenſive expedition. One year with another, it produces to the governor 15,000 Turkiſh ſequins, or 4687*l.* When Eaſter is paſt, each perſon returns to his own country, proud of being able to rival the Mahometan in the title of pilgrim, and bearing imprinted on their hands, wriſts, or arms, figures of the croſs or ſpear, with the cypher of Jeſus and Mary. The difference between theſe two claſſes of pilgrims is, that thoſe of Mecca are called "Hadjes," and thoſe of Jeruſalem "Mokodſi," a name formed from that of the city, "El-Kods." The number of pilgrims who reſide at Jeruſalem for five or ſix months, leave behind them a ſum not leſs than 62,500*l.* (See PILGRIMAGE.) Theſe pilgrims draw together to Jeruſalem a ſwarm of mendicants; and yet notwithſtanding the wealth accumulated and expended in this city under the influence of prieſtcraft and ſuperſtition, the church of the Holy ſepulchre, the glory of former times, and the monument of Helena's piety, is ſo much neglected, that the ſnow falls into the middle of it: the beams, ſaid to be cedar, are falling, and the whole roof is in a ruinous ſtate. The Armenian convent is ſaid to be elegant, and ſo extenſive as to furniſh accommodation for no leſs than 1000 pilgrims. When Mr. Browne viſited this city in February 1797, a very deep ſnow lay upon the ground for 12 or 13 days. The Catholic convent has a large ſubterraneous ciſtern, into which the ſnow, melting from the roof and other parts, is conveyed, and ſupplies the monks with water for a great portion of the year. JERUSALEM, a poſt-town of America, in the county of Ontario, and ſtate of New York; lying on the W. ſide of Seneca lake, and containing about 50 families, and 1219 inhabitants; 30 miles N.E. by N. of Bath.

JERUSALEM, or *Funks-town*, a town of Maryland, in Waſhington county, about 2½ miles S.W. of Elizabeth town; containing about 50 dwellings and a German church.—Alſo, a poſt-town in Southampton county, Virginia; 250 miles from Waſhington.

JERUSALEM, *Old*. See FALLEN *City*.

JERUSALEM, a town of the duchy of Courland; 44 miles E.S.E. of Seelburg.—Alſo, a town of the duchy of Stiria, celebrated for its wine; four miles S.S.W. of Fridaw.

JERUSALEM, *New*, in *Theology*. See MILLENNIUM.

JERUSALEM *Artichoke*, in *Botany*. See HELIANTHUS.

JERUSALEM *Cowſlip*. See PULMONARIA.

JERUSALEM *Croſs*. See LYCHNIS.

JERUSALEM *Oak*. See CHENOPODIUM.

JERUSALEM *Sage*. See PHLOMIS.

JERUSALEM, *Sage of*. See PULMONARIA.

JERUYO, in *Geography*, a ſingular mountain, ſituated in the valley of Urecho, in Mexico or New Spain; which before the year 1760 was a ſmall hill, bearing a ſugar plantation, but from September in that year it has continued to emit fire and burning rocks, that have formed themſelves into three high mountains, whoſe circumference in 1766 was nearly ſix miles. At the eruption the aſhes were forced to the diſtance of 150 miles.

JERXHEIM, a town of the principality of Wolfenbuttel; 13 miles E.S.E. of Wolfenbuttel.

JESAN, a delightful mountain of Japan, near the lake of Oitz; which is eſteemed ſacred, and, according to Kæmpfer, is ſaid to preſent not leſs than 3000 temples.

JESAW, a town of Pruſſia, in the circle of Natangen; 10 miles S. of Konigſberg.

JESEN, in *Ichthyology*. See JENTLING.

JESENITZA, in *Geography*, a town of Croatia; 35 miles N.W. of Bihacs.

JESERNICO, a town of Italy, in the country of Friuli; 12 miles W. of Palma la Nuova.

JESERO, a ſingular lake in the iſle of Cherſo, which only diffuſes its waters every fifth year.

JESHANA, in *Scripture Geography*, a city of Ephraim (2 Chron. xiii. 19.), probably the ſame with *Zin* (Numb. xxxiv. 4.), placed by Euſebius and Jerom ſeven miles N. of Jericho.

JESHIMON, probably the ſame with *Heſmona*, *Aſcmona*, or *Eſcmona*, a city in the wilderneſs of Maon, belonging to Simeon, lying in the S. of Paleſtine, and even in Arabia Petræa, 1 Sam. xxiii. 24.

JESI, in *Geography*, a town of the marquiſate of Ancona; the ſee of a biſhop, containing three churches and ten convents; 16 miles W.S.W. of Ancona. N. lat. 40° 31′. E. long. 13° 10′.

JESILBASCH, *Green-head,* a name of reproach which the Perſians give to the Turks, becauſe their emirs wear a green turban.

JESIORO, in *Geography,* a town of Poland, in the palatinate of Kiev; 56 miles S.S.W. of Czyrkaſſy.

JESSAMINE, in *Botany.* See JASMINUM.

JESSAMINE, in *Geography,* a county of Kentucky, in America; containing 5438 inhabitants, of whom 1553 are ſlaves. The chief town is Nicholasville.

JESSANT, formed from the obſolete French *jeſſer, to riſe,* or *ſpring out,* in *Heraldry,* is applied to a fleur-de-lis, or the like figure, ſeeming to ſpring or ſhoot out of ſome other charge. He bears ſable; three leopards' heads; jeſſant, fleurs-de-lis, or.

JESSE, a large braſs candleſtick, with many ſconces hanging down in the middle of a church or choir. This invention was firſt called *jeſſe,* from the ſimilitude of the branches to thoſe of the *arbor jeſſæ.* This uſeful ornament of churches was firſt brought over into this kingdom by Hugh de Flory, abbot of St. Auſtin's, in Canterbury, about the year 1100.

JESSELMERE, in *Geography,* a town of Hindooſtan, in the circar of Bickaneer; 60 miles W. of Bickaneer. N. lat. 27° 28′. E. long. 72° 51′.

JESSEN, a town of Saxony, on the Elſter; 10 miles E.S.E. of Wittenberg. N. lat. 51° 48′. E. long. 13° 3′.

JESSES denote ribbons hanging down from garlands and crowns; alſo the ſhort ſtraps of leather faſtened to a hawk's legs, and ſo to the vervels; and birds, in *Heraldry,* are ſaid to be *jeſſed,* when theſe jeſſes are of a different tincture from the other parts.

JESSIMA, in *Geography,* one of the iſlands of Japan.

JESSNITZ, a town of Germany, in the principality of Anhalt, on the Muldau; nine miles S. of Deſſau. N. lat. 51° 42′. E. long. 12° 20′.

JESSO, JEDSO, or *Yedſo,* a large iſland in the North Pacific ocean, N. of Niphon, which having received ſome Japaneſe colonies, is generally regarded as ſubject to Japan; but, being inhabited by a ſavage people, is rather conſidered as a foreign conqueſt than as a part of this civilized empire. The inhabitants live chiefly on fiſh and game. This iſland is divided by a narrow ſtrait, about 20 miles broad, from the iſland of *Segalian,* or *Tchoka,* which ſee. N. lat. 42° to 45°. E. long. 146° 10′ to 147° 10′.

JESSORE, a town of Bengal; 54 miles N.E. of Calcutta. N. lat. 23° 7′. E. long. 89° 16′.

JESTING, or *Conciſe Wit,* as diſtinguiſhed from continued wit or *humour* (which ſee), lies either in the thought, or the language, or both. In the firſt caſe it does not depend upon any particular words or turn of the expreſſion. But the greateſt fund of jeſts lies in the language, *i. e.* in tropes or verbal figures; thoſe afforded by tropes conſiſt in the metaphorical ſenſe of the words, and thoſe of verbal figures principally turn upon a double ſenſe of the ſame word, or a ſimilitude of ſound in different words. The third kind of jokes, which lie both in the ſenſe and language, ariſe from figures of ſentences, where the figure itſelf conſiſts in the ſenſe, but the wit turns upon the choice of the words. Ward's Orat. vol. ii. Lect. 40. See WIT.

JESUATES, JESUATÆ, an order of religious, otherwiſe called *Apoſtolical Clerks,* or *Jeſuates of St. Jerom.*

They were founded by John Colombini in 1368, and approved of by Urban V. in 1369, at Viterbo; where he himſelf gave, to ſuch as were preſent, the habit they were to wear. They followed the rule of St. Auguſtin, and were ranked by Pius V. among the order of Mendicants.

They were called Jeſuates, becauſe their firſt founders had the name of Jeſus continually in their mouths: to which they added the name of St. Jerom, becauſe they choſe that ſaint for their protector.

For two centuries the Jeſuates were mere lay-brothers; but in 1606, Paul V. gave them leave to enter into holy orders. In moſt of their houſes they were employed in pharmacy, diſtributing their medicines gratis; others practiſed diſtillation, and ſold aqua vitæ; which occaſioned their being called *aqua-vitæ mongers.*

Being very rich in the ſtate of Venice, that republic ſolicited their ſuppreſſion, and obtained it of Clement IX. in 1668, their effects being employed towards ſupporting the expences of the war in Candia.

JESUITISSÆ, in the *Romiſh Church,* an order of nuns which followed the rule of the Jeſuits, which was ſuppreſſed by pope Urban VIII. in the year 1630.

JESUITS, an order of religious, founded by Ignatius Loyola, a Biſcayan military gentleman, of a fanatical and ambitious ſpirit, called alſo *the Society of Jeſus.*

They are alſo ſometimes called *Loyolites,* and ſometimes *Inighiſts,* from the Spaniſh name of their founder, which was *Inigo de Guipuſcoa.*

This order, which was the moſt political and beſt regulated of all the monaſtic orders, and from which mankind have derived more advantages, and received greater hurt, than from any other of theſe religious fraternities, has rendered itſelf very conſiderable by its miſſions into the Indies, and by its other employments relating to the ſtudy of the ſciences, and the education of youth. The council of Trent calls them "Regular Clerks of the Company of Jeſus."

In the year 1538, Ignatius, having aſſembled ten of his companions at Rome, choſen moſtly out of the univerſity of Paris, propoſed to them to make a new order. After this, he preſented the plan of his inſtitution, ſuggeſted, as he gave out, and his followers ſtill teach, by the immediate inſpiration of heaven, to the Roman pontiff, Paul III. who appointed a committee of cardinals to examine it; upon whoſe report, that the eſtabliſhment was unneceſſary as well as dangerous, Paul refuſed to approve it. This oppoſition was principally urged by the learned and worthy cardinal Guidiccioni.

This oppoſition was vanquiſhed by the dexterity of Ignatius, who propoſed, that beſides the three vows of poverty, chaſtity, and monaſtic obedience, the members of this ſociety ſhould take a fourth vow of obedience to the pope; binding themſelves to go whitherſoever he ſhould command, for the ſervice of religion, and without requiring any thing from the holy ſee for their ſupport. However, Ignatius, and his company in the ſame charter of their order in which they declare their implicit and blind allegiance to the court of Rome, promiſe a like implicit and unlimited allegiance to the general of their ſociety. The pontiff, perceiving this inſtitution to be an object of conſequence, confirmed it under the name of the "Company of Jeſus" by a bull in 1540; and appointed Ignatius Loyola to be the firſt general of the order. Loyola was originally an illiterate ſoldier, and is ſuppoſed by many to have been only a flexible inſtrument in the hands of able and ingenious men, who made uſe of his fortitude and fanaticiſm to anſwer their purpoſes, and perſons much more learned were employed to compoſe the writings which bear his name. Geddes's Tracts, vol. iii. p. 429.

By this bull the number was reſtrained to ſixty; but that reſtriction was taken away two years afterwards by another bull. The order has ſince been confirmed by ſeveral ſucceeding popes, who have added many new rights and privileges to it.

In leſs than half a century after its inſtitution, the ſociety obtained eſtabliſhments in every country that adhered to the Roman Catholic church; in the year 1608, the number of Jeſuits had increaſed to 10,581. In the year 1710, the order poſſeſſed 24 profeſſed houſes; 59 houſes of probation; 340 reſidencies; 612 colleges; 200 miſſions; 150 ſeminaries and boarding-ſchools; and conſiſted of 19,998 Jeſuits.

The conſtitution and laws of the ſociety were perfected by Laynez and Aquaviva, the two generals who ſucceeded Loyola, men far ſuperior to their maſter in abilities, and in the ſcience of government. Several circumſtances concurred to the rapid progreſs and extenſive influence of the Jeſuits. They were taught to conſider themſelves as formed for action, and bound to exert themſelves continually, as ſoldiers in the ſervice of God, and of the pope, his vicar on earth. And that they might have full leiſure for their active ſervice, they were totally exempted from thoſe functions, the performance of which is the chief buſineſs of other monks. They were required to attend to all the tranſactions of the world; to ſtudy the diſpoſitions of perſons in high rank, and to cultivate their friendſhip; and by the conſtitution as well as genius of the order, a ſpirit of action and intrigue was infuſed into all its members. Beſides, the form of government of this order was peculiar: Loyola, full of the ideas of implicit obedience, which he had derived from his military profeſſion, appointed that the government of this order ſhould be purely monarchical. A general, choſen for life by deputies from the ſeveral provinces, poſſeſſed power that was ſupreme and independent, extending to every perſon and to every caſe. He, by his ſole authority, nominated provincials, rectors, and every other officer employed in the government of the ſociety, and could remove them at pleaſure. In him was veſted the ſovereign adminiſtration of the revenues and funds of the order. Every member belonging to it was at his diſpoſal; and by his uncontrollable mandate, he could impoſe upon them any taſk, or employ them in whatſoever ſervice he pleaſed. To his commands they were required to yield not only outward obedience, but to reſign to him the inclinations of their own wills, and the ſentiments of their own underſtandings. There is not in the annals of mankind any example of ſuch a perfect deſpotiſm, exerciſed not over monks ſhut up in the cells of a convent, but over men diſperſed among all the nations of the earth. It is carefully provided, that the general ſhould be perfectly informed with reſpect to the character and abilities of his ſubjects. Every novice, who offered himſelf a candidate for entering into the order, was obliged to manifeſt his conſcience to the ſuperior, or to a perſon appointed by him every ſix months: each member was likewiſe enjoined to obſerve the words and actions of the novices, and to diſcloſe every thing of importance to the ſuperior. The provincials and heads of the ſeveral houſes were alſo obliged to tranſmit to the general, regular, frequent, and minute reports concerning the members under their inſpection. Theſe reports were digeſted and arranged in regiſters, by which the general might eaſily ſurvey the ſtate of the ſociety in every corner of the earth; obſerve the qualifications of its members, and chooſe proper inſtruments for any neceſſary ſervice. The number of theſe reports received annually by the general was 6584, which divided by 37, the number of provinces in the order, gives 177 reports concerning the ſtate of each province tranſmitted annually to Rome. The general alſo received, by the conſtitution of the order, an account of the civil affairs of the country where his ſubjects reſided; ſo that he was furniſhed with full information concerning the tranſactions of every prince and ſtate in the world. The Jeſuits, from their firſt inſtitution, conſidered the education of youth as their peculiar province; and before the expiration of the 16th century, they had obtained the chief direction of this buſineſs in every Catholic country in Europe. They had alſo become the confeſſors of almoſt all its monarchs; they were the ſpiritual guides of almoſt every perſon eminent for rank or power; and they poſſeſſed the higheſt degree of confidence and intereſt with the Papal court, as the moſt zealous and able champions for its authority. The order, notwithſtanding the vow of poverty which they contrived to elude, acquired ample poſſeſſions in every Catholic country. Beſides the ſources of wealth common to all the regular clergy, they obtained, under a pretext of promoting the ſucceſs of their miſſions, and of facilitating the ſupport of their miſſionaries, a ſpecial licence from the court of Rome to trade with the nations which they laboured to convert. In conſequence of this, they engaged in an extenſive and lucrative commerce, both in the Eaſt and Weſt Indies: they alſo aimed at obtaining ſettlements, and accordingly acquired poſſeſſion of a large and fertile province in the ſouthern continent of America, and reigned as ſovereigns over ſome hundred thouſand ſubjects.

The progreſs and influence of the Jeſuits were likewiſe much promoted by their mutual union for the good of the common cauſe; by their reputation for learning and ſcience, in which they excelled all the other orders, though M. d'Alembert ſays, that the order has never produced one man, whoſe mind was ſo much enlightened with ſound knowledge as to merit the name of a philoſopher: by the ſeverity of their diſcipline and regularity of their conduct and manners; by propagating a ſyſtem of relaxed and pliant morality, which accommodated itſelf to the paſſions of men, juſtified their vices, tolerated their imperfections, and authorized almoſt every action, which the moſt audacious or crafty politician would wiſh to perpetrate. So that the abbé Boileau ſays of them, they are a people who lengthen the creed and ſhorten the decalogue; by extending the juriſdiction and abſolute power of the court of Rome; and by the zeal which they have manifeſted in combatting the opinions and checking the progreſs of the Proteſtants.

The end principally propoſed by this order was to gain converts to the Romiſh church; with which view they diſperſed themſelves in every country and nation, and with amazing induſtry and addreſs purſued the end of their inſtitution. No difficulty ſo great that they could not ſurmount, no danger ſo imminent that they would not undergo; and, as ſome ſay, no crimes ſo ſhocking that have not been perpetrated by them for the ſervice of their cauſe.

Of all the Jeſuits, who diſtinguiſhed themſelves by their zealous and laborious attempts to extend the limits of the church, none acquired a more ſhining reputation than Francis Xavier, commonly called "The Apoſtle of the Indians." He ſailed for the Portugueſe ſettlements in India in 1522, and ſoon diffuſed the knowledge and profeſſion of the popiſh religion over a great part of the continent and neighbouring iſlands. In 1529 he laid the foundation of a conſiderable church in Japan; againſt which, however, a violent perſecution was commenced in 1615, and laſted ſeveral years, and terminated in the utter extirpation of Chriſtianity, and an edict forbidding all Europeans, a few Dutch merchants excepted, to approach the Japaneſe dominions; and having embarked for China, he died in 1552, within ſight of it. Others, after his death, and particularly

Ricci, an Italian, penetrated into China, and eſtabliſhed churches, ſome remains of which ſubſiſt to this day. Robert de Nobili is much celebrated by the Jeſuits on account of his ſucceſs in proſelyting the Brachmans: for the method he uſed, ſee BRACHMANS. The Jeſuits are charged by the Janſeniſts and Dominicans with many fraudulent practices in their attempts to propagate Chriſtianity in China; and particularly with endeavouring to perſuade the Chineſe, that the doctrine of Confucius and that of the goſpel were not eſſentially different, and that Jeſus Chriſt had been known and worſhipped in their nation many years ago. Ricci allowed the Chineſe converts to retain the profane cuſtoms and the abſurd rites of their Pagan anceſtors; but his opinion was condemned by the Dominicans and Franciſcans. This difference laid the foundation of a long and violent conteſt. Innocent X. in 1645, pronounced ſentence in favour of the Dominicans; but, about eleven years after, Alexander VII. granted the Chineſe the indulgence propoſed by Ricci. Complaints were renewed by the Dominicans in 1661, and again in 1674, under the pontificate of Innocent XI.; and the diſpute was carried on both in Europe and China, from the year 1684, till the queſtion was decided to the diſadvantage of the Jeſuits in the year 1704, by Clement XI.; but this edict was mitigated in 1715. It is well known that the inquiſition erected by the Jeſuits at Goa, where the body of Xavier lies interred, and is worſhipped with the higheſt marks of devotion, and the penal laws, whoſe terrors they employed ſo freely in propagation of the goſpel, contributed much more than their arguments and exhortation, which were but ſparingly uſed, to engage the Indians to embrace Chriſtianity.

About the beginning of the 17th century, the Jeſuits obtained admiſſion into the fertile province of Paraguay, in South America, where they found the inhabitants in a barbarous and ſavage ſtate; they began with inſtructing and civilizing them; cultivating amongſt them the arts and manufactures, and accuſtoming them to the bleſſings of ſociety, ſecurity, and order. By this method they ſecured their eſteem and confidence; and a few Jeſuits preſided over ſome hundred thouſand Indians. However, it appears from the moſt credible relations, that they ſoon changed their views from the propagating of Chriſtianity, to ſchemes of inſatiable avarice and boundleſs ambition: and they have ſent yearly to the members of their order, in Europe, immenſe quantities of gold, drawn from ſeveral American provinces where they have power and property, but chiefly from Paraguay, which belonged to them only: and it is evident, from later diſcoveries, which have proved the ruin of the Jeſuits in Spain and Portugal, that they had eſtabliſhed an independent empire in this province, ſubject to their ſociety alone, and which, by the ſuperior excellence of its conſtitution and police, could ſcarcely have failed to extend its dominions over all the ſouthern continent of America. They cut off every kind of communication between the Spaniards and Portugueſe in the adjacent ſettlements, and the Indians; inſpired the latter with hatred and contempt of theſe nations; induſtriouſly avoided giving the Indians any knowledge of the Spaniſh, or other European language; inſtructed them in the art of war; formed them into bodies of cavalry and infantry, and provided them with artillery and magazines ſtored with all the implements of war. Such was the ſtate of things when, in the year 1750, the courts of Madrid and Liſbon entered into a treaty for fixing the limits of their reſpective dominions in South America. In the execution of the treaty, in the year 1752, the Jeſuits demurred; and a war enſued between the Spaniſh and Portugueſe on one ſide, and the Indians, animated by the Jeſuits, on the other; which was the real and original cauſe of the diſgrace of the Jeſuits at the court of Portugal.

The Jeſuits have been juſtly charged with inculcating the moſt licentious and dangerous maxims with regard to morality and religion: ſuch are the following extracted from their writings. That perſons truly wicked and void of the love of God, may expect to obtain eternal life in heaven, provided that they be impreſſed with a fear of the divine anger, and avoid all heinous and enormous crimes through the dread of future puniſhment: that thoſe perſons may tranſgreſs with ſafety, who have a probable reaſon for tranſgreſſing, *i. e.* any plauſible argument or authority in favour of the ſin they intended to commit: that actions intrinſically evil, and directly contrary to the divine laws, may be innocently performed, by thoſe who have ſo much power over their own minds, as to join, even ideally, a good end to this wicked action, or to ſpeak in their ſtyle, who are capable of directing their intention aright: that philoſophical ſin is of a very light and trivial nature, and does not deſerve the pain of hell: by philoſophical ſin they mean an action contrary to right reaſon, which is done by a perſon who is either abſolutely ignorant of God, or does not think of him during the time this action is committed: that the tranſgreſſions committed by a perſon blinded by the ſeduction of luſt, agitated by the impulſe of tumultuous paſſions, and deſtitute of all ſenſe and impreſſion of religion, however deteſtable and heinous they may be in themſelves, are not imputable to the tranſgreſſor before the tribunal of God; and that ſuch tranſgreſſions may often be as involuntary as the actions of a madman: and that the perſon who takes an oath, or enters into a contract, may, to elude the force of the one, and the obligation of the other, add to the form of words that expreſs them, certain mental additions and tacit reſervations. Some of theſe maxims were condemned by a public edict of pope Alexander VII. in 1659; and that relating to philoſophical ſin met with the ſame fate in 1690, under the pontificate of Alexander VIII. Neither of theſe bulls are to be found in the "Bullarium Pontificum;" but they are induſtriouſly preſerved by the Janſeniſts and Dominicans. The corrupt morality of the Jeſuits was humourouſly and learnedly attacked by the famous Paſcal, in his work, entitled "Les Provinciales, ou Lettres écrits par Louis de Montalte, à un Provincial de ſes Amis et aux Jeſuits, ſur la Morale et la Politique de ces Pères." The Jeſuits, however, obtained a ſentence againſt the Provinciales, by which they were condemned to be burnt publicly at Paris. Another excellent book, by Perrault, publiſhed at Mons, in 3 volumes 8vo., in the year 1702, entitled "La Morale des Jeſuits, extrait fidélement de leurs Livres, imprimés avec la Permiſſion et l'Approbation des Superieurs de leur Compagnie, par un Docteur de Sorbonne," was burnt at Paris, in the year 1670, at the requeſt of the Jeſuits. The famous Arnauld, with ſome of his Janſeniſt brethren, have undertaken to prove, that the Jeſuits reduced their pernicious maxims to practice, in a celebrated work, entitled "La Morale Pratique des Jeſuits," conſiſting of eight volumes 8vo., the ſecond edition of which was publiſhed at Amſterdam in the year 1742. For an account of the controverſy between the Jeſuits and Janſeniſts, ſee JANSENISTS.

The Jeſuits had no particular habit; but changed and accommodated it to times and occaſions. The order conſiſted of five different claſſes; *profeſſed fathers*, *ſpiritual coadjutors*, *approved ſcholars*, *lay brothers*, called alſo *temporal coadjutors*, and *novices*. Some writers make only three claſſes, *viz.* the *profeſſed members*, the *ſcholars*, and the *novices*. Some add a ſixth claſs, under the title of *adjuncts*, which they ſay was numerous, and was incorporated with the other claſſes, and diſguiſed under different ſorts of apparel.

The *profeſſed fathers*, which made the body of the company, took the three ſolemn vows of religion publicly, and to theſe add a ſpecial vow of obedience to the head of the church, as to what regards miſſions among idolaters, heretics, &c.—The *ſpiritual coadjutors* alſo made public vows of chaſtity, poverty, and obedience; but omitted the fourth relating to miſſions. —*Approved ſcholars* were thoſe who, after two years noviciate, had been admitted, and had made three vows of religion; not ſolemn, indeed, but yet declared. Theſe were in the way to become profeſſed, or ſpiritual coadjutors, according as the general thought fit. Theſe degrees, eſpecially that of profeſſed, were never conferred till after two years noviciate, and ſeven years ſtudy, ſeven of regency, a third year of noviciate, and thirty-three years of age; the age at which our Saviour is ſuppoſed to have been crucified. The vows of the ſcholars were abſolute on their ſide, but only conditional on the ſide of the order; the general having it in his power to diſpenſe with them.

The order was divided into *aſſiſtances*, the aſſiſtances into *provinces*, and the provinces into *houſes*. It was governed by a general, who was perpetual and abſolute. He reſided at Rome, and was elected by a general congregation of the order. He had with him five perſons, who were, as it were, his miniſters. They were called aſſiſtants, and bore the name of the kingdom or country to which they belonged, and by which they were appointed; *viz.* of Italy, France, Spain, Germany, and Portugal. To theſe belonged the care of preparing the matters of their reſpective aſſiſtances, and of putting them in a method to facilitate their diſpatch.

Each province had four kinds of houſes, *viz. profeſſed houſes*, which could have no lands belonging to them; *colleges*, where the ſciences were taught; *reſidences*, where were a number of workmen employed in ſuch offices, as had any immediate relation to preaching, confeſſion, miſſions, &c.; and houſes of *novices*. Among the colleges there were ſome called ſimply *colleges*, and others called *ſeminaries*. Theſe laſt were ſet apart for the young Jeſuits to go through their courſes of philoſophy and theology in; the others were for ſtrangers.

Each province was governed by a *provincial*, and each houſe by a *ſuperior;* who was called *rector* in the colleges, and a *ſuperior* in the other houſes. Ignatius regulated the diſcipline of theſe houſes, and eſpecially of the colleges, by what he had obſerved in the Sorbonne, while he ſtudied at Paris.

The profeſſed of this order renounced by a ſolemn vow all preferment, and eſpecially prelacy; and could not receive any, unleſs enjoined thereto by the pope, under pain of ſin. This the pope ſometimes did; inſomuch that they have had eight cardinals of their order.

The reader will find, in the preceding part of this article, a brief but comprehenſive account of the Jeſuits, as to their origin and influence, and the chief cauſes on which their influence depended, and the nature of their conſtitution: it remains to direct his views to their decline and actual ſuppreſſion, in ſome parts of Europe, where their credit, power, and opulence had at one time arrived to a prodigious height. In France, the aſſaſſination of Henry IV. by Jean Chatel, one of their ſcholars, and the writings of the Jeſuit Guignard, in favour of regicide, induced ſeveral of the parliaments of the provinces to expel them, as a deteſtable and diabolical ſociety, the corruptors of youth, and enemies to the king and ſtate. But they were again favoured by Louis XIII. and cardinal Richelieu, and alſo by Louis XIV.; in whoſe reign they obtained the revocation of the edict of Nantes againſt the Proteſtants, and ſucceeded almoſt to their utmoſt wiſhes in ſuppreſſing the Janſeniſts, their inveterate enemies. However, at this period, their affairs ſeem to have taken a different turn. Father Tellier's violence in deſtroying the famous Port-Royal, and the univerſal commotion occaſioned by the bull Unigenitus, raiſed clamours againſt them, which never ſubſided till their ruin. The refuſal of the ſacrament to the Janſeniſts ſerved alſo to light up the flame which ſucceeded, and before it could be extinguiſhed, effected the diſſolution of the Jeſuits. About this time they alſo refuſed, as it is ſaid out of reſpect to the queen and dauphin, to undertake the ſpiritual guidance of La Pompadour: and whilſt they offended the court by their ſcruples, they diſpleaſed it equally by their intrigues; laying ſnares for diſgracing perſons in place, whoſe only crime was a diſregard for their ſociety. They alſo offended men or letters by their violent declamations againſt the Encyclopédie, and by their abuſe of Voltaire, the author of the Henriade. In this ſituation of the Jeſuits, the war broke out between England and France, which involved the ſociety in that famous law-ſuit, which directly brought on its deſtruction. Having carried on a conſiderable commerce in the iſland of Martinico, and ſuſtained ſome loſſes by the war, they wanted to compound their debts with their correſpondents in Lyons and Marſeilles. Theſe correſpondents, looking upon the ſociety in general to be anſwerable for their brethren in Martinico, addreſſed themſelves to a certain Jeſuit in France, demanding juſtice. This good father, and the Jeſuits in general, demurred, and ſtood trial before the grand-chamber of the parliament of Paris, where they were caſt; and not only ſentenced to pay the immenſe ſums in litigation, but interdicted for the future all manner of commerce. This ſentence led into an examination of their conſtitution by their own books; which appeared to be contrary to the laws of the kingdom, the obedience due to the king, the ſafety of his perſon, and the peace of the ſtate. Beſides, the Jeſuits were grown rich, inſolent, and imperious; and though they profeſſed to have renounced the world, they were found to be tutors, courtiers, merchants, politicians, prieſts, and wanted nothing leſs than to be governors and rulers of the earth. Theſe were ſufficient motives for ſuppreſſing them: the attempt to aſſaſſinate the French king in 1757 was charged on the Jeſuits: and the actual aſſaſſination of the king of Portugal in the following year, which induced the Portugueſe miniſter to drive them all out of the kingdom, in 1759 increaſed the odium againſt them. The parliament of Paris having taken a whole year to enquire into the nature of their inſtitution, and news of the capture of Martinico in the mean while arriving, the miniſter, as M. d'Alembert ſays, in order to cauſe a diverſion, thought on the expedient of proceeding farther againſt the Jeſuits; and the principal of their college was commanded to obey the arrets of parliament, and to ſhut up their ſchools on the firſt of April, 1762. On the ſixth of Auguſt following, their inſtitution was unanimouſly condemned by the parliament, without any oppoſition on the part of the ſovereign; the ſociety was of courſe diſſolved; and their poſſeſſions alienated and ſold; the other parliaments of the kingdom following ſooner or later the example of that of Paris: nay ſome of them acted with ſtill greater ſeverity, driving them out of their provinces without ſtanding upon forms of law. In general, however, individuals were permitted to reſide in France, on renouncing the ſociety, and taking oaths of allegiance to the king. In a little while after, the king iſſued an edict, which aboliſhed the ſociety throughout all France. The parliament of Paris, on regiſtering this new edict, ordained the Jeſuits to reſide each in his own dioceſe, and to preſent themſelves every ſix months before the magiſtrates of the place in which they ſhall dwell. The ſame arret forbade them to come within ten leagues of Paris, and baniſhed them at leaſt ſix leagues from Verſailles, but prohibited them not from dwelling at Fontainbleau and Compiegne, where the court reſided at leaſt three months in the year. The Jeſuits were expelled from Portugal in 1759; from France in 1764; from Spain and Naples in 1767; and their ſociety was totally aboliſhed, in 1773, by pope Clement XIV. JESUS, formed of the Hebrew יהושע, *Jehoſhuah*, from ישׁע, and denoting "he that ſhall ſave," or "the Saviour," is an appellation appropriated by extraordinary direction, and in a very peculiar and diſtinguiſhing manner, to the Son of God and the Saviour of the world; the long predicted and expected Meſſiah. (Luke, i. 26—38.) This name is frequently uſed in connection with that of "Chriſt," for the origin and meaning of which ſee that article. For the different ſenſes in which the appellations Son *of God* and Son *of Man* have been underſtood, ſee thoſe articles reſpectively. No one who adverts, even in the ſlighteſt manner, to the hiſtory of our bleſſed Lord given by the four Evangeliſts, and to the writings of thoſe who were ſupernaturally inſtructed to teach his doctrine, can heſitate for a moment in allowing the propriety of aſcribing to him the name of "Jeſus" in a ſuper-eminent degree: for though this was a name of Hebrew etymology, and was given, under one form or other, to ſeveral diſtinguiſhed perſons among the Jews, it never could be more fitly applied than to him, who, acting under a divine commiſſion, ſaved mankind from ſin and death, and conducts them to knowledge, pardon, holineſs, and immortality. See Christian *Religion*.

Of the life of Jeſus Chriſt we have an authentic account by the four evangeliſts, Matthew, Mark, Luke, and John. (See each article reſpectively, and alſo Evangelists.) The account of theſe hiſtorians chiefly relates to his diſcourſes and conduct after he commenced the exerciſe of his public miniſtry. After giving us brief information concerning his birth, lineage, family, and parents, they tell us that he was born at Bethlehem; and that in order to avoid the jealouſy and cruelty of Herod, he was taken by his parents into Egypt. Upon the death of Herod he returned to Judea; but excepting one ſpecimen that is recorded of his early wiſdom, when he diſputed with the Jewiſh doctors in the temple at the age of 12 years, we know little of his hiſtory till he attained the age of about 30 years. Whether he was employed in his father's buſineſs, during his earlier years, as ſome have aſſerted, it is not poſſible certainly to determine. We know, however, that he increaſed in wiſdom as well as ſtature, and in favour with God and man. Before he commenced his public miniſtry, his advent was announced by John the Baptiſt, and he was baptized by him in the river Jordan. In the courſe of his ſubſequent life, which was of no long duration, he maintained a character ſingularly irreproachable, and in the moſt perfect degree exemplary. He was active and unwearied in communicating inſtruction, and in performing miracles, which, in their nature, mode of operation, and general objects, exhibited the unparallelled benevolence of his diſpoſition, and which ſerved to evince, to every unprejudiced obſerver, his divine origin and miſſion. In his character and conduct, as well as in his humble and ſuffering ſtate, he manifeſted to the world that he was the predicted and long expected Meſſiah; and the predictions which he himſelf delivered, ſerved, in their ultimate iſſue and accompliſhment, to manifeſt the ſame important and uſeful purpoſe. For his aſſiſtance in the diſſemination of his ſuper-excellent doctrine, and by way of preparing ſuitable ſucceſſors, when his life terminated, he appointed apoſtles and evangeliſts, who were ſupernaturally endowed and qualified for the ſervice which was aſſigned them. After a limited period of ſervice and ſuffering, a conſpiracy was formed againſt him by the leaders of the Jewiſh nation; which, after the purpoſes of his miſſion, during his life, were fulfilled, took effect by the treachery of Judas Iſcariot. At length he was brought before the Sanhedrim; and though Pilate, the Roman governor, teſtified to his innocence, and wiſhed to preſerve his life, the clamour of the populace prevailed. Jeſus was condemned to ſuffer an ignominious death, and the ſentence was ſpeedily executed. By his death he accompliſhed the purpoſes of the divine wiſdom and goodneſs, as he had previouſly fulfilled them in the courſe of his life; and on the third day roſe from the dead, agreeably to his prediction, and appeared at ſundry times and in various places to his diſciples. (See Resurrection.) Having ſpent the interval of 40 days in affording ſatisfactory evidence of his reſtoration to life to competent witneſſes, and in inſtructing his apoſtles concerning the nature of his kingdom and the objects of their commiſſion, he viſibly aſcended to heaven, and, as a further evidence of his continued exiſtence, and of the powers with which he was inveſted, conferred extraordinary gifts on his apoſtles, deputing and qualifying them for propagating his religion in the world. See Christian *Religion*.

Concerning the perſon of Jeſus Chriſt, the rank of being he ſuſtained, and the manner of his introduction to the world, divines, both ancient and modern, have entertained very different opinions. With regard to the perſon of Jeſus Chriſt (ſee Person), ſome have ſuppoſed that he is the ſame in ſubſtance, and equal in power and glory, with the Father. The ſecond article of the church of England expreſſes this doctrine in the following words: "The Son, which is the Word of the Father, begotten from everlaſting of the Father, the very and eternal God, of one ſubſtance with the Father, took of man's nature in the womb of the bleſſed Virgin, of her ſubſtance; ſo that two whole and perfect natures, that is, the godhead and manhood, were joined together in one perſon, never to be divided: whereof is one Chriſt, very God and very man, who truly ſuffered, was dead and buried." Others, who cannot adopt this generally received opinion concerning Chriſt, as God, of the ſame ſubſtance, and equal with the Father, reject the common meaning of the word *perſon*, and admit only what they call a modal diſtinction. But in order to avoid the charge of Sabellianiſm, which they conceive to be a very pernicious opinion, and which holds one perſon only in the Deity, under three different denominations, they ſay, that though the Father, the Son, and the Holy Ghoſt are not three diſtinct beings, or individuals, there is a diſtinction, which may be repreſented by that of three perſons. (See SABELLIANS.) Others again, dreading the tritheiſm charged upon the common opinion, ſuppoſe the Son to be inferior to the Father in every reſpect but this, that they are co-eternal, and have all the divine attributes that are communicable, not of themſelves, but of the Father. Epiſcopius and Cudworth adopted this opinion, and were followed by Dr. Clarke, Jackſon, &c. Dr. Clarke, in particular, maintained, that there is one Supreme Being, who is the Father, and two ſubordinate, derived and dependent beings; but he waves calling Chriſt a *creature*, as the ancient Arians did, and principally on that foundation diſclaims the charge of Arianiſm. (See SEMI-ARIANS.) Biſhops Pearſon and Bull, and alſo Dr. Owen, were of opinion, that though God the Father is the *fountain* of the Deity, the whole divine nature is communicated from the Father to the Son; yet ſo as that the Father and Son are not ſeparate, nor ſeparable from the divinity, but do ſtill exiſt in it, and are moſt intimately united to it. Dr. Watts, who has been followed by others, in what ſome have denominated the "indwelling ſcheme," and which, as it is ſometimes interpreted, has merely ſhades of difference from Sabellianiſm, maintained, that one ſupreme God dwells in the human nature of Chriſt, which he ſuppoſes to have exiſted the firſt of all creatures; and he ſpeaks of the divine *Logos* (which ſee) as the *wiſdom* of God, and the *Holy Spirit* (ſee SPIRIT) as the divine *power*, or the influence and effect of it; which, he ſays, is a ſcriptural perſon, *i. e.* ſpoken of figuratively in ſcripture under perſonal characters. Others, claſſed, however they differ from one another, under the general denomination of Arians, ſuppoſe the Son to be a ſpiritual being or intelligent agent, ſubordinate and inferior to the Father; not the ſame with the Father, or equal to him, or of the ſame nature and eſſence; but ſaid to be God, on account of his great excellence and power, derived to him by the will of the Father. But of thoſe who adopt this general opinion there are various gradations, as we have already ſhewn under the article ARIANS. Others, who are ſuppoſed to adopt ſentiments ſimilar to thoſe of the ancient Nazarenes and Ebionites, and who in later times have been denominated Socinians and Unitarians, though they have no excluſive title to the latter appellation, maintain, that Jeſus is a man, poſſeſſing a reaſonable ſoul united to a human body, and favoured by God with extraordinary communications of knowledge and power. Some of this claſs believe that Jeſus was a man, not made as Adam, but born of a woman, not in the ordinary way of generation, but of a virgin, by the immediate operation and miraculous power of God (Luke, i. 35.); but others, rejecting the ſentiment of a miraculous conception, are of opinion that Jeſus Chriſt was literally and truly the ſon of Joſeph and Mary, born like other men in the ordinary courſe of nature, and ſubject to ſimilar infirmities. This man, they ſay, was endowed with extraordinary gifts and powers for fulfilling the important commiſſion with which he was entruſted; and when the purpoſes of his ſelection and appointment were completed, he died, and was raiſed from the dead, in teſtimony to the truth of the important doctrine taught by him, and as a pattern of that reſurrection of which he aſſured his faithful followers. Whether this opinion, or that of thoſe who maintain the pre-exiſtent dignity of the ſpirit of Jeſus Chriſt, and its union with a corporeal frame by an extraordinary interpoſition of divine power, be moſt agreeable to the high notions we are led to entertain of the impeccable and exemplary character and ſuper-eminent office ſuſtained by Chriſt, as the teacher, ſaviour, and judge of mankind, and alſo to the language of the Old and New Teſtament by which he is deſcribed, we leave to the unprejudiced conſideration and impartial deciſion of the reader. Perſons of both theſe deſcriptions equally maintain the unity of God, and of the object of worſhip; and are therefore unqueſtionably entitled to the appellation of Unitarians. Moreover, it is his duty to deliberate, and to inquire without prejudice, equally diſregarding the charge of credulity and innovation, whether he ought not to retain, or even now to adopt, the commonly received notion concerning the perſon of Jeſus Chriſt, ſanctioned as it is by the authority of many learned divines, who, after diligent examination, conceive it to be moſt conformable to the language of ſcripture, and to the doctrine of divine revelation. See TRINITY and UNITARIANS.

Under the article EPOCHA *of Chriſt*, we have ſtated the opinions that have been generally adopted with regard to the era of our Saviour's nativity and the time of his death. But as different ſentiments have been maintained reſpecting the duration of his miniſtry, we ſhall here inquire into the reaſons on which they are founded. To this purpoſe, St. Luke ſays (ch. iii. 1, 2.) "Now in the 15th year of the reign of Tiberius Cæſar, Pontius Pilate being governor of Judea,——the word of God came unto John, the ſon of Zacharias:" and the evangeliſt adds (ch. i. 21—23.) "Jeſus alſo being baptized.——And Jeſus himſelf began to be about 30 years of age." It is added in St. John's goſpel, as another note of time to our preſent purpoſe, (ch. ii. 20.) "Forty and ſix years was this temple in building." From ſeveral circumſtances ſtated by Dr. Lardner, it appears that Jeſus was born about a year and ſix or ſeven months before the death of Herod, that is, before the latter end of the year of Rome 748 or 749, that is, in September or October. We have ſhewn under the article EPOCHA with what propriety our Lord might be ſaid to be "*about* 30 years of age" in the fifteenth year of Tiberius, ſuppoſing it to be the fifteenth of his proconſular empire. Accordingly, if the fifteenth of Tiberius's proconſular empire began the 28th of Auguſt, A.U. 778. A.D. 25, and if John the Baptiſt began to preach in November that year, but did not baptize Jeſus till after he had preached a year and ſome months, then the paſſover at which theſe words were ſpoken was the paſſover A.U. 780. A.D. 27. Or, if the fifteenth year of Tiberius's reign began A.U. 779. A.D. 26, and John began then to preach, and Jeſus was baptized by him ſome time before the paſſover next following, ſtill theſe words would be ſpoken by the Jews at the paſſover A. U. 780. A.D. 27. The eighteenth year of Herod's reign, from the death of Antigonus, is ſuppoſed to have begun ſome time in A.U. 734. Herod might make his offer to the Jews of rebuilding the temple at the feaſt of tabernacles in November that year: from November A.U. 734. to the paſſover A.U. 780. A.D. 27, is almoſt 45½ years; at this time, therefore, the Jews might not improperly ſay, the temple had been 46 *years in building*. The 46th year was then current, and it was to the purpoſe of the Jews rather to add to than to diminiſh the time which had been ſpent in that work; ſo that there is no time more ſuitable to theſe words of the Jews than the paſſover A.D. 27; though there is no manner of inconſiſtency between underſtanding the fifteenth of Tiberius, of his proconſular empire, and ſuppoſing that theſe words were ſpoken at the paſſover A.D. 28, and then the temple might have been 46 years in building. The words of St. Luke, "and Jeſus himſelf began to be about 30 years of age," may be underſtood with ſome latitude. Jeſus might be 32 years of age or more at this time; the word *about*, ωσει, being often uſed when a preciſe exactneſs is not intended or expected. Matt. xiv. 21. Mark, vi. 44. Luke, ix. 14. John, vi. 10. Acts, ii. 41. Luke, i. 56. xxii. 41. John, i. 39. Acts, v. 36. Underſtanding St. Luke's words in this manner, it would be eaſy to ſhew the agreement of his numbers with the time of our Saviour's nativity. The fifteenth of Tiberius's ſole empire began A.U. 781. A.D. 28. If Jeſus was baptized the ſixth of January A.U. 782. A.D. 29, he would be but ſome months above 33 years of age, though he was born ſo ſoon as September A.U. 748. And if he was born A.U. 749, then, though his baptiſm be placed in the beginning of A.U. 783. A.D. 30, ſtill he would be little more than 33 years of age. All the other notes of time are alſo very eaſily reconciled with this fifteenth year of Tiberius's ſole empire. Pontius Pilate came into Judea before the paſſover, in the twelfth year of Tiberius's ſole empire, A.U. 779. A.D. 26, and continued there ten years, therefore he was undoubtedly governor of Judea at the commencement of John the Baptiſt's miniſtry, and till after our Saviour's crucifixion. As for the words of the Jews, ſpoken by them at the firſt paſſover of our Saviour's miniſtry, "Forty-ſix years has this temple been in building;" it is but to ſuppoſe that they referred not to the time when Herod made the propoſal of repairing the temple, in the eighteenth year of his reign, but to the time when, in purſuance of that propoſal, he actually ſet about the work, after he had got all things in readineſs for it, and it will be eaſily perceived that theſe words are agreeable to truth. Dr. Lardner ſuggeſts, that the ſuppoſition of St. Luke's intending the firſt of the epochs abovementioned, that is, the fifteenth of Tiberius's proconſular empire, ſeems to be very much favoured by the firſt Chriſtians; who generally place the crucifixion of Jeſus at the paſſover of the fifteenth of Tiberius's ſole empire, when the two Gemini were conſuls of Rome, A.D. 29. With regard to the duration of our Lord's miniſtry, it appears from the above ſtatement to be between two and three years. Thus alſo, according to the Harmony of Tatian, A.D. 220, it conſiſts of two years and a part, for the third year, in which our Lord dies, is not complete. Tatian therefore computes three paſſovers in the goſpels, at the laſt of which Jeſus ſuffered. And it is evident that he reckoned no more, becauſe he does not ſuppoſe the "feaſt" of the Jews, mentioned John, v. 1. to have been a paſſover, but pentecoſt, as he plainly calls it. This, ſays Dr. Lardner, is a mark of antiquity; modern harmoniſts, who prolong our Lord's miniſtry beyond the ſpace of three years, generally reckon this feaſt, though without any good reaſon, a paſſover. So Irenæus computed three paſſovers in our Lord's miniſtry: and Origen too ſays, that Judas was not three years with Jeſus. Indeed it appears, that this father thought our Saviour's whole miniſtry was above two, but not quite three years, while the moſt public part of it did not conſiſt of more than a year and ſome months: and this, ſays Dr. Lardner, "I have long taken to be the truth, ſo far as I am capable of learning it from a careful reading of the goſpels." In St. John's goſpel are three paſſovers, and our Saviour's miniſtry has two years and a part; but the former part of his miniſtry there related, was not ſo public as that after John's impriſonment. In the other three evangeliſts, who relate chiefly our Lord's moſt public preaching after John the Baptiſt's impriſonment, is the hiſtory of only ſomewhat more than the ſpace of one year; how much more it is not very eaſy to ſay; all which is much confirmed by comparing them with St. John. Euſebius diſcovered four ſucceſſive paſſovers in the goſpel of St. John, and therefore was of opinion that our Saviour preached three years and a half; and his opinion has been generally prevalent. Some critics, indeed, have extended the public miniſtry of Chriſt a year or two farther, and ſir Iſaac Newton makes it to comprehend five paſſovers: whereas the oldeſt Chriſtian fathers were almoſt univerſally of opinion, that our Lord preached no longer than one year, or one year and a few months. Mr. Mann ſome years ago propoſed the hypotheſis of *one year*, to which he ſeems to have been led by his peculiar interpretation of Daniel's 70 weeks, with which he makes it to correſpond. The birth of Chriſt he aſſigns to the ſeventh year before the commencement of the common Chriſtian era, A.U. 747. Jul. Per. 4707, and he places his death in the year 26, or the fifteenth of Tiberius, reckoned from the time of his becoming aſſociate in the empire with Auguſtus. Mr. Mann lays great ſtreſs upon the teſtimony of the ancient fathers, cited by ſir Iſaac Newton in his "Obſervations upon Daniel," *viz.* Clemens Alexandrinus, Origen, Tertullian, Julius Africanus, Lactantius, Jerome, Auſtin, Sulpicius Severus, and Proſper, to whom he adds Juſtin Martyr, and Valentinus the heretic. Beſides, he obſerves that Luke mentions only two epochs in his hiſtory of Chriſt, that of his birth and that of his baptiſm; and therefore he was, with reaſon, underſtood by the fathers to comprehend in the ſecond epoch his death with his baptiſm, both happening within the compaſs of the ſame year, or but a few months more. To this, ſays he, may be added the probability that the evangeliſt mentions both Annas and Caiaphas as high prieſts, becauſe Annas was in that office in that year which included moſt of the preaching and miracles of Chriſt, and Caiaphas in the other, in the firſt quarter of which our Lord ſuffered. Moreover, the paſſage in Iſaiah, lxi. 1, 2, which our Lord read in the ſynagogue at Nazareth, and which he notified to be then fulfilled, *viz.* "The ſpirit of the Lord is upon me, for he has anointed me to preach the acceptable year of the Lord," was anciently, ſays Mr. Mann, thought to ſignify that Chriſt was to preach but one year, diſtinguiſhed by that appellation. Beſides, Matthew, Mark, and Luke evidently ſuppoſed the preaching of only one year; and even John's goſpel, which alone has been thought to ſuppoſe more, will not, in fact, be found to do ſo. For he mentions only one ſummer and one winter. He deſcribes the events of only two paſſovers, one pentecoſt, one feaſt of tabernacles, and one feaſt of dedication; and he mentions them in their natural order, if we ſuppoſe that the ſixth chapter of this evangeliſt hath been tranſpoſed out of its proper place, and that it ſhould precede the fifth. Againſt Mr. Mann's hypotheſis, it has been objected that in John, vi. 4, we read, "And the paſſover, a feaſt of the Jews, was nigh." But he anſwers, that John could not have written thus; becauſe he had mentioned the paſſover in ch. ii. and related ſeveral of the events of it: he could not, therefore, ſuppoſe that his readers would want an explanation of the term in that place. Gerard Voſſius, and other critics, would therefore read, "And a feaſt of the Jews was nigh," and they imagine, that the word "paſſover" was firſt added as a conjectural explanation of ſome perſon or other. However, it is again alleged, that the ancient fathers could never have imagined, as they did, that Chriſt preached only one year, if this third paſſover had been ſo expreſsly mentioned in their copies of this goſpel. Beſides, there is no mention of Chriſt's affiſting at any third paſſover. Mr. Mann's hypotheſis has been adopted by Dr. Prieſtley, who has endeavoured, by an examination of Mr. Mann's reaſoning, and by new arguments, to confirm it. He alleges, that ſome very ſhort periods of our Lord's public miniſtry appear, according to the accounts of all the evangeliſts, to have been very full of buſineſs; and if, he ſays, our Lord had paſſed three or four years in this manner, and the twelve apoſtles had alſo been teaching and working miracles in ſix different places, for the ſpace of a year or more, in that ſmall country, and the 70 alſo in 35 places more, for the ſame ſpace of time as is generally ſuppoſed; ſuch a number of miracles would have been performed, as this author cannot but think muſt have exceeded every proper purpoſe of them. Either there could have been no unbelievers left in Judea; or, if the tendency of the miracles had been to exaſperate, ſuch a reſentment would have been excited in the minds of the Jewiſh rulers, as, without a greater miracle than any of the reſt, could not but have terminated in his death long before. Beſides, it is more eaſy to account for the prejudices of the apoſtles, and their ignorance of the true nature of Chriſt's kingdom, even at and after our Lord's death, and the ſuppoſition that his miniſtry was of a ſhort, than that it was of a long duration. Farther, if our Lord really preached three or four years, and, conſequently, if the evangeliſts have ſometimes paſſed over all the events of whole years at a time, is it not ſurpriſing that none of them ſhould ever connect thoſe very diſtant parts of their narrative by ſuch phraſes as *the year following*, *after one*, or *after two years*, &c. &c.; their uſual tranſition, *after theſe things*, or *afterwards*, cannot be conſtrued to mean *after a year or two*. Again, if Jeſus had been preaching and working miracles, both in Judea and in Galilee, almoſt a year before the death of John the Baptiſt, agreeably to the common hypotheſis, Herod, who reigned in Galilee, could not but have heard of him, and therefore could not but have known that he was not John that was riſen from the dead, as in Matt. xiv. 1. Whereas, if we ſuppoſe that Jeſus had preached only a few weeks before the death of John, we may imagine, that, engaged as Herod was in a multiplicity of buſineſs and pleaſure, he might not have heard of him till that time; and therefore might, with ſome plauſibility, conjecture, as he did, that he was John riſen from the dead. This argument is conſidered by Dr. Prieſtley as almoſt concluſive againſt the common hypotheſis. Moreover, all our Lord's journeys, of which the evangeliſts give any account, agree in ſo many circumſtances, that they are evidently the ſame, and are ſuppoſed to be ſo by all harmoniſts. All his journeys to Jeruſalem amount to no more than four; three of which, at leaſt, every pious Jew was obliged to make in the compaſs of every year. John, who ſupplies many of the deficiencies of the other evangeliſts, only makes up the number of them to four. Dr. Prieſtley conſiders the objections to this hypotheſis, urged by archbiſhop Newcome and others, and endeavours to obviate them. He then arranges the leading events in the life of Chriſt, and points out the particular periods in which they occurred, together with the circumſtances attending them; and cloſes with a computation of the time that was neceſſary for the purpoſe of Chriſt's miniſtry. He annexes a calendar, exhibiting the months and days that elapſed between the firſt of the Jewiſh month Niſan, anſwering to the 17th of March in the Julian computation, to the 30th of Niſan, correſponding to the 2d of April in the following year, together with the principal events that happened during each particular period. According to this calendar, Jeſus, before the paſſover in the 14th of Niſan, had attended the preaching of John, had been baptiſed by him, had paſſed 40 days in the wilderneſs, and had preached in Judea, probably both before and after his return to Cana in Galilee, where he turned the water into wine. The enſuing pentecoſt happened on the 6th of the Jewiſh month Sivan, or the 20th of May; the tranſfiguration, the 6th of Abb, or the 18th of July; the feaſt of tabernacles, the 15th of Tiſri, or the 24th of September; the feaſt of dedication, on the 25th of Ceſleu, or 2d of December; the reſurrection of Lazarus, in the beginning of Adar, or February; the triumphant entry into Jeruſalem, on the 10th of Niſan, or 13th of March; the paſſover, at which the Lord's ſupper was inſtituted, on the 14th of Niſan, or 17th of March; the crucifixon of Chriſt, on Friday the 15th of Niſan, or 18th of March, A. D. 29; his reſurrection, on the 17th of Niſan, or 20th of March; and his appearance to the apoſtles, when Thomas was preſent, on the 24th of Niſan, or 27th of March. Calmet's Dict. Lardner's Works. Prieſtley's Harmony. Newcome's Harmony.

JESUS *de Cuyaba, El*, in *Geography*, a town of Brazil, in the government of Matto Groſſo.

JESUS *Iſland*, a ſmall iſland in the Pacific ocean, diſcovered by Mendana in 1567, and inhabited by a copper-coloured and mulatto race of men; eight degrees due N. of the New Hebrides. S. lat. 6° 50′. E. long. from Paris 165°.—Alſo, an iſland in the river St. Laurence, near that of Montreal, about 24 miles long and ſix wide.

JESUS *de Machaca*, a town of Peru, in the dioceſe of La Paz; 40 miles W. of La Paz.

JESUS *Maria*, a town of South America, in the province of Cordova; 30 miles N. of Cordova.

JESUS *Maria de los Montes*, a town of South America, in the government of Buenos Ayres; 60 miles S. of Santa Cruz de la Sierra la Nueva.

JESUS, in *Ichthyology*, a name given by the people of Dantzic to the fiſh called by Geſner the blue chub, or capito cæruleus. It is called alſo *jeſe*, *jeſen*, and *jeſitz*.

JESUS, *Fathers of the Oratory of*. See ORATORY.

JESUS, *Order of*. See *Order of* SERAPHIM.

JESUS *Chriſt, Order of*, was inſtituted at Avignon, in Italy, by pope John XXII. in the year 1320. The reigning pope was appointed ſovereign and maſter of the order. The badge of the order, which is worn by the knights pendent to a ſcarlet ribbon tied to a button-hole of the waiſtcoat, is a croſs of gold, enamelled gules, and edged with gold.

JESUS *and Mary, Order of*, was inſtituted in Italy, in the year 1615, by pope Paul V. The knights of this order were ſworn to defend the holy ſee of Rome againſt all infidels and heretics; and for that purpoſe each knight was conſtantly to keep ready a horſe completely accoutred, a ſword, and a lance, and each of his domeſtics armed with a fuſil. The badge of this order was a croſs of eight points, like that of Malta, red, edged with gold, bearing in the centre the letters I. H. S. and over them the letter Ω, the ſymbol of the Holy Virgin.

JET, GAGATES, in *Natural Hiſtory*, the name of a foſſil ſubſtance, the characters of which are theſe: it is a ſolid, dry, opaque, inflammable body, found in large detached maſſes of a fine and regular ſtructure, having a grain like that of wood, ſplitting more eaſily horizontally than in any other direction, very light, and moderately hard, not fuſible, unleſs in a moderately ſtrong heat, but readily inflammable, and burning a long time with a fine greeniſh white flame, and bituminous ſmell. Its ſpecific gravity is 1.3. See *Pitch-coal* under the article COAL.

Jet has been often confounded with the common cannel coal, though a proper conſideration of their diſtinguiſhing characters is ſufficient to eſtabliſh the difference between them.

Jet is always found in detached maſſes lodged in other ſtrata; cannel coal conſtitutes of itſelf whole ſtrata. Jet has the grain of wood, and ſplits horizontally much more eaſily than in any other direction; cannel coal has no peculiar grain, and ſplits with equal eaſe any way. Jet is but moderately hard, cannel coal not leſs ſo than many ſtones; and jet, when ſet on fire, flames a long time; cannel coal but a little while. Jet is found in Italy, Germany, and the Eaſt Indies, but no where ſo plentifully as in England; it is very common in Yorkſhire, and other of the northern counties, and is found in many of our clay pits about London.

Mr. Farey remarks, that jet is perhaps only in England found imbedded in the alum ſhale ſtrata of Yorkſhire; of which numerous ſpecimens are met with in the ſhale cliffs near Whitby, and at Huntcliff and Cleveland, as Dr. Grew mentions; although the alluvial clays, and the ſands on the ſhores of moſt places on the eaſtern coaſt of England, produce ſpecimens of jet. Near Leige, and near Zuicca, in Meſena, it is found in conſiderable quantities; and on the coaſts of Baſilan or Baſſilian, one of the Philippine iſles. Mr. Mawe, in his Mineralogy of Derbyſhire, p. 92 and 93, mentions indurated bitumen found in that county which reſembles jet.

By diſtillation jet yields firſt an acid liquor, then a thin, and afterwards a thick black oil. By friction it becomes electrical, as amber does. See Amber.

Jet, in *Medicine*, was highly praiſed by the ancients, but the modern practice has never enquired whether juſtly or not. Dioſcorides tells us, that it is an excellent emollient and diſcutient; he recommends a fumigation of it for diſeaſes of the womb, and ſays, that water, in which burnt jet has been quenched, is a cordial. Aëtius orders it to be extinguiſhed in wine for the ſame purpoſe. It has been much uſed by the perfumers.

There is alſo a fictitious jet, made of glaſs, in imitation of the mineral jet: this is now uſually drawn out into long hollow threads, which are cut and faſhioned at pleaſure. It is much uſed in embroideries, and in the trimmings of mourning, and may be made of any colour, though it is uſually black and white; and of late is denominated *bugles*.

Jet *d'Eau*, a French word, ſignifying a fountain that caſts up water to any conſiderable height in the air.

The velocity of a ſmall jet of water iſſuing in any direction from a reſervoir, is nearly equal, in favourable circumſtances, to the velocity acquired by a body in falling through the height of the ſurface of the reſervoir above the orifice. Suppoſing a very ſmall plate of water, immediately within the orifice, to be put in motion at each inſtant by means of the whole preſſure of the fluid, which is equal to the weight of a column on the ſame baſe, of the height of the reſervoir; and ſuppoſing the whole preſſure to be employed in generating the velocity of the thin ſtratum, neglecting the motion of the ſurrounding fluid, this ſtratum would be urged by a force as much greater than its own weight as the column is higher than its thickneſs, through a ſpace which is ſhorter than the height of the column in the ſame ratio. But the ſpaces being inverſely as the forces, the final velocities are equal; and the velocity then generated would be equal to that of a body falling through the height of the column. And although a part of the preſſure of the column is expended in producing motion in its own particles, this part is not wholly loſt, becauſe the velocity of theſe particles renders them more eaſily actuated by the preſſure of the ſucceeding column. Still, however, ſome deduction muſt be made for the lateral motions of the neighbouring particles, which tend rather to diminiſh the quantity of the diſcharge, than to leſſen the actual velocity of the jet: the particles approaching, and even paſſing through the orifice obliquely, contract the diameter of the ſtream nearly in the ratio of 4 to 5, when the aperture is in a thin plate: but the velocity in the contracted part is only one-fortieth or one-fiftieth leſs than that which is due to the height.

Here we may obſerve, that the velocity of the diſcharge through different kinds of apertures may be found by multiplying the ſquare root of the height in feet by a certain co-efficient: this, for the undiminiſhed velocity, is 8.0229; for an orifice imitating the form of the contracted ſtream, 7.8; for bridges with pointed piers, 7.7; for bridges with ſquare piers, 6.9; for ſhort pipes, from two to four times as long as their diameter, 6.6; for orifices in a thin plate, and for weres, about 5. When the orifice is made between two reſervoirs, the diſcharge is nearly in the ſame relation to the difference of their heights.

A jet of water iſſuing from an orifice of a proper form, and directed upwards, riſes nearly to the height of the head of water in the reſervoir. For it has been ſhewn, that the velocity is nearly equal to that which is produced by the fall of a body through the height, and each of the particles may be conſidered nearly as a ſeparate projectile.

If a jet iſſue horizontally from any part of the ſide of a veſſel, ſtanding on an horizontal plane, and a circle be deſcribed having the whole height of the fluid for its diameter, the fluid will reach the plane at a diſtance from the veſſel, equal to that chord of the circle in which the jet initially moves. The horizontal velocity of the jet, being equal to that which is acquired by a body falling through the diſtance A B (*Plate* XIV. *Hydraulics*, *fig.* 1.), below the ſurface, would deſcribe, in the time of falling through A B, a diſtance equal to 2 A B (ſee Accelerated *Velocity*), and in the time of falling through B C, in which the jet will reach the horizontal plane, a diſtance greater in the ratio of thoſe times, or of the ſquare roots of the ſpaces. Call A C, 1; then $1 : AD :: AD : AB$, $AD^2 = AB$, and $AD = \sqrt{AB}$; in the ſame manner $CD = \sqrt{BC}$, therefore the times are as A D and C D: but $AD : CD :: AB : BD$, and 2 B D, or D E, will be equal to the ſpace C F deſcribed by the horizontal velocity in the time of falling through B C. See *Hydraulic Laws of* Fluids.

Notwithſtanding what we have above ſtated with regard to the aſcent of a jet, it is well known that a jet d'eau will never raiſe water ſo high as its reſervoir; and, therefore, gives leſs water than if it went to the full height. Of this phenomenon there are ſeveral cauſes: the firſt is, that the velocity of the lower particles of the jet is greater than the velocity of the upper; and, therefore, the lower water ſtrikes that which is next above it; and as fluids move every way, by its impulſe widens and conſequently ſhortens the column. Another cauſe is, that the water at the top of the jet does not immediately fall off, but forms a kind of ball or head, the weight of which depreſſes the jet; if the jet be a little inclined, it will play higher, but be leſs beautiful: beſides, the friction againſt the ſides of the hole of the ajutage, or ſpouting-pipe, will make a ſmall jet riſe to a leſs height than a larger one from the ſame reſervoir. To remedy this inconvenience, the ſpouting holes ſhould be increaſed in proportion to the height of the ſpouting water, provided that they are not made too wide for the pipe of conduct. The fourth cauſe is the air's reſiſtance, which is proportional to the ſquare of the velocity, with which the water of the jets of different heights ſtrike it: and, therefore, the deficiency in height being in the ſame proportion, a jet that plays with a double velocity will have that deficiency four times as great, &c. Thus, if a jet of five feet high loſe one inch in height, by coming from a reſervoir of five feet one inch high, a jet produced from a reſervoir of ten feet four inches, will riſe but ten feet; and in this manner a table might be eaſily formed ſhewing by what height of reſervoirs jets of a determinate height may be produced. The following table ſhews in feet, and decimals of a foot, what jets will be produced by reſervoirs of a determinate height.

Referv.	Jet.	Referv.	Jet.	Referv.	Jet.	Referv.	Jet.	Referv.	Jet.	Referv.	Jet.
5	4.91	21	20.58	39	34.93	56	48.24	73	60.71	90	72.48
6	5.88	23	21.46	40	35.74	57	48.99	74	61.42	91	73.15

21	19.70	38	34.11	55	47.48	72	60.	89	71.81		

By various experiments that have been made by Mr. Mariotte, Dr. Deſaguliers, and others, it has been found, that if the reſervoir be five feet high, a conduct-pipe $1\frac{3}{4}$ inch diameter will admit a hole in the ajutage from $\frac{1}{4}$ of an inch to $\frac{3}{8}$ of an inch; and ſo on as in the following table:

Height of Reſervoir.	Diameter of the Ajutage.	Diameter of the Pipes of Conduct.
5 Feet	$\frac{1}{4}$ to $\frac{3}{8}$	$1\frac{3}{4}$ inch.
10	$\frac{1}{4}$th to $\frac{1}{2}$ an inch	2 inches.
15	$\frac{1}{2}$ an inch	$2\frac{1}{2}$ inches.
20	$\frac{1}{2}$ an inch	$2\frac{1}{2}$ inches.
25	$\frac{1}{2}$ an inch	$2\frac{3}{4}$ inches.
30	$\frac{1}{2}$ to $\frac{3}{4}$ of an inch	3 inches, or $3\frac{1}{2}$.
40	$\frac{3}{4}$ of an inch	$4\frac{1}{2}$ inches.
50	$\frac{3}{4}$ of an inch	5 inches.
60	1 inch	$5\frac{3}{4}$ inches or 6.
80	$1\frac{1}{4}$ inch	$6\frac{1}{2}$ inches or 7.
100	$1\frac{1}{4}$ or $1\frac{1}{2}$ inch	7 or 8 inches.

Here the jet is ſuppoſed to be within 100 or 150 yards of the reſervoir; but if the conduct-pipe much exceeds this length, it muſt be of a larger diameter than what is here aſſigned. Thus for jets from $\frac{3}{4}$ of an inch to thoſe of an inch and $\frac{1}{4}$, and from reſervoirs from 40 to 90 feet height, if the diſtance be from 150 yards to $\frac{1}{4}$ of a mile, the diameter of the pipe ſhould be of ſix inches; from $\frac{1}{4}$ of a mile to two miles, it muſt be of ſeven inches; and from two miles to five, it muſt be of eight inches diameter for the ſame jet.

If it be required to keep any number of jets playing whoſe ajutages are given in diameter, by one common conduct-pipe, we muſt find the diameter of an ajutage equal to all the given ones. Thus if there be four ajutages of $\frac{3}{4}$ of an inch diameter each, then the ſquare of $\frac{3}{4}$ is $\frac{9}{16}$, which multiplied by the number of ajutages 4, makes $\frac{36}{16}$: the ſquare root of which is $\frac{6}{4} = 1\frac{1}{2} =$ the diameter of the ajutage equal to all the four ſmall ones. A pipe of conduct of 10 inches diameter will ſupply all the jets, as being a little more than ſix times as great as the diameter of the one large ajutage now found. After this manner the dimenſions of a conduct-pipe may be found in any other number of ajutages.

In order to make a jet play to the greateſt poſſible height, the part of the conduct-pipe at the ajutage ſhould not turn up at right angles, but with a gentle eaſy curve: for the beſt ſtructure of the ajutage, ſee AJUTAGE. See alſo FOUNTAIN. Deſaguliers' Courſe of Exp. Phil. vol. ii. lect. vii. annot.

JET *Rings*, annular pieces of jet of large dimenſions, found in many parts of England, and eſteemed Roman antiquities. They are of different kinds; ſome being plain, others wrought, but all of them are much too large for rings. The ſmalleſt of them are three inches in diameter; yet the bore is not above an inch and a half, which makes them as much too ſmall for the wriſt as they are too large for the fingers.

JETAÏBA, in *Botany*, a name given by ſome authors to the trees which afford the gum anime of the ſhops.

JETANS, or CAMANCHES, as the Spaniards call them, or *Padoucas* as they are denominated by the Pawnees, in *Geography*, a powerful nation, entirely erratic, without the leaſt ſpecies of cultivation, ſubſiſting ſolely by the chaſe. Their wanderings are confined to the frontiers of New Mexico on the W., the nations on the Lower Red river on the S., the Pawnees and Oſage on the E., and the Utahs, Kyaways, and various unknown nations on the N. Their nation, although entirely in the territories of the United States, is claimed excluſively by the Spaniards, and may be ſaid to be decidedly in their intereſt. They are the only nation who border on the Spaniſh ſettlements, which that government treats as an independent people. They are by the Spaniards reputed brave.

JETHLAH, or Jethala, in *Ancient Geography*, a town of Paleſtine, in the tribe of Dan. Joſh. xix. 1, 2.

JETPOUR, in *Geography*, a town of Hindooſtan, in Guzerat; 10 miles N. of Junagur.

JETSON. See Flotson.

JETTY, in *Engineery*, is the name for a ſmall pier or projection into a river, for narrowing it and raiſing the water above that place. See Tranſactions of the Society of Arts, vol. xxiv.

Jetty-*head*, in the *Royal Dock-yards*, is a name uſually given to that part of a wharf which projects beyond the reſt; but more particularly the front of a wharf, whoſe ſide forms one of the cheeks of a wet or dry dock.

JETZ, in *Geography*, a town of Japan, in the iſland of Niphon; 84 miles N.N.E. of Meaco.

JEU, *Fr.* in *Muſic*, the action of playing upon an inſtrument. See Jouer.

Plein-jeu and *demi-jeu* are often uſed by the French for *forte* and *piano*.

JEVER, in *Geography*, a town of Germany, and capital of a country called "Jeverland," ſituated in the N.E. part of Eaſt Frieſland, on the W. ſide of the mouth of the Weſer, which belongs to the prince of Anhalt-Zerbſt; 28 miles N.E. of Emden. N. lat. 53° 30′. E. long. 7° 53′.

JEUNE, Claude le, in *Biography*. See Claudin.

JEUREV-POLSKAI, in *Geography*, a town of Ruſſia, in the government of Vladimir; 32 miles N.N.W. of Vladimir.

JEUX, *Fr.* See Games.

Jeux *d'Orgues*, *Fr.* ſtops of an organ.

Preſtant	uniſon with the	Open diapaſon,
Bourdon	double baſe	Borduun,
Bombarde	baſe to the hautbois	Baſſoon,
Nazard	octave of the 5th	Twelfth,
Tierce	double octave of the ſharp 3d	Tierce,
Larigot		Octave of the twelfth,
Voix angelique	octave of the	Vox humana.

Many of the names of ſtops in French organs are the ſame as in Engliſh organs built by Renatus Harris ſoon after the reſtoration: ſuch as the flute, tierce, larigot, cornet, furniture, trumpet, vox humana, or voix humaine, cromorne, clarion, &c. We ſhall give Engliſh equivalents to the reſt in the article Organ, where will be found a liſt of the ſtops in the famous organ at Haerlem.

JEW-Bill, in *Law*, is the famous ſtatute 26 Geo. II. cap. 26. which enabled all Jews to prefer bills of naturalization in parliament, without receiving the ſacrament, as ordained by ſtat. 7 Jac. I. This act was repealed by 27 Geo. II. c. 1.

JEWEL, any precious ſtone, or ornament beſet with them. (See Diamond, Ruby, &c.) The uſe of jewels prevailed to a great degree, and at an enormous expence, among the Jews, Greeks, and Romans; and has continued in various nations to this day.

Jewel, John, in *Biography*, a learned prelate of the church of England, and zealous champion for the Proteſtant cauſe, deſcended from a very reſpectable family, was born at Buden, in Devonſhire, in the year 1522. He received at different ſchools, in his own county, the elements of a learned education, and before he was fourteen years of age we find him at Merton college, Oxford, where he made great progreſs in the learning of the place, and was at the ſame time initiated in the principles of the reformed religion. In the year 1539, he removed to Corpus Chriſti college, of which he had been elected a ſcholar, and in the following year he took his firſt degree. Soon after this he commenced tutor with high reputation, and contributed much to promote the reformation, by privately inſtructing his pupils in Proteſtant principles. Mr. Jewel, at this period, though looked up to by his contemporaries on account of his great learning, was not more celebrated for his literary acquirements, than he was for eminent piety, and the exemplarineſs of his manners. In 1544, he was admitted to the degree of M.A., and upon the acceſſion of Edward VI. in 1546, he openly avowed himſelf a Proteſtant, and embraced every opportunity which offered itſelf to promote the progreſs of the reformation, both in his college lectures, and in private converſation. He obtained ſome church preferment, and his talents as a preacher procured for him great acceptance, and general applauſe. The zeal which he diſplayed during the whole of king Edward's reign, to diſſeminate Proteſtant principles, occaſioned his being one of the firſt victims to the reſentment of the Papiſts upon the acceſſion of queen Mary: he was immediately expelled from his college, but ſo high did he ſtand for real talent, that he was at the ſame time appointed the orator of the place, and actually employed to draw up a congratulatory addreſs upon the acceſſion of the new queen. It has indeed been thought, that this appointment was intended for the purpoſe of enſnaring him, either by rendering him odious to his own party, if he accepted it, or by provoking the enmity of the Catholics, if he refuſed it. Mr. Jewel, however, diſappointed his enemies, for the addreſs which he drew up on the occaſion was worded by him in ſuch reſpectful and guarded terms, that it gave no offence to either party, and was favourably received by the queen. Mr. Jewel now withdrew from the impending ſtorm, but his enemies followed him, and being urged with the threat of a cruel death, his fortitude forſook him, and he ſigned his belief of doctrines which his underſtanding rejected, and his heart abhorred. This public declaration was of but little ſervice to him, his enemies thirſted for his blood, and the furious Bonner was reſolved, if poſſible, to attain the object of his wiſhes, but after encountering a thouſand hair-breadth eſcapes, he was ſafely landed on the Continent, and thus freed from the perils which threatened him. He immediately proceeded to Frankfort, and made a public confeſſion before the Engliſh exiles in that city of his ſincere contrition on account of his late ſubſcription, begging pardon of God, and of the church, for the weakneſs which he had diſcovered in that tranſaction. After a ſhort ſtay at Frankfort, he went to reſide with his old friend Peter Martyr at Straſburg, whom he accompanied to Zurich, where he aſſiſted him in the publication of ſome of his writings, and in the compoſition of his theological lectures. On the death of queen Mary, Mr. Jewel returned to his native country, and was graciouſly received by queen Elizabeth, who appointed him one of the ſixteen divines ſelected to hold a public diſputation in Weſtminſter abbey, upon the principal points of controverſy between the Proteſtants and Papiſts. He was alſo commiſſioned with others to viſit certain dioceſes in the weſtern parts of England, with the view of eradicating Popery from them, and, in the year 1560, he was promoted by his ſovereign to the biſhopric of Saliſbury. He was inceſſant in the work attached to his office, and was literally worn out in the duties which he conceived to belong to the paſtoral office. He died in September 1571, at Monkton-Farley, in Wiltſhire, when he was in the fiftieth year of his age: he was author of a vaſt number of works, many of which are ſtill held in high eſtimation. They were collected and printed uniformly in 1609, and ſome of his letters are preſerved in Biſhop Burnet's Hiſtory of the Reformation. He was one of the moſt eminent ſcholars among the reformers: was a great proficient in the learned and in ſome of the modern languages: he had a ſtrong memory, which he ſo improved by art, that he was able to repeat moſt exactly what he had written after once reading it. Biog. Brit.

JEWEL-*Blocks*, in a *Ship*, are two ſmall blocks, which are ſuſpended at the extremity of the main and fore-top-ſail-yards, by means of an eye-bolt, driven from without into the middle of the yard-arm, parallel to its axis. The uſe of theſe blocks is to retain the upper part of the top-maſt-ſtudding-ſails beyond the ſheets of the top-ſails, ſo that each of theſe ſails may have its full force of action, which would be diminiſhed by the incroachment of the other over its ſurface.

JEWISH BELIEVERS, in *Eccleſiaſtical Hiſtory*. See EBIONITES and NAZARENES.

JEWISH *Canon*. See CANON.

JEWISH *Œconomy*. See ŒCONOMY.

JEWISH *Hours*. See HOURS.

JEWISH *Muſic*. See HEBREW *Muſic*.

JEWISH *Nation*. See HEBREWS.

JEWIT, RANDAL, or RANDOLPH, in *Biography*, a diſciple of Orlando Gibbons, and bachelor of muſic in the univerſity of Dublin, was organiſt of Chriſt-church in that city, where he was ſucceeded by Bateſon.

In 1639, Jewit reſigned his place at Dublin, where his ſucceſſor was Benjamin, afterwards Dr. Rogers; and returning to England, he was appointed organiſt of Wincheſter, where he died after having acquired great eſteem for ſkill in his profeſſion.

JEW'S EAR. See AURICULA *Judæ*.

JEW'S *Frankincenſe*, in *Botany*. See STYRAX.

JEW'S *Mallow*. See CORCHORUS.

JEW'S *Stone*, in *Natural Hiſtory*. See *Lapis* JUDAICUS.

JEW'S *Stone*, in *Mining*, ſignifies baſalt, win, or trap, in the collieries of Shropſhire. See Plymley's Report on the Agriculture of that County, p. 61, &c.

JEWS, in *Geography* and *Hiſtory*, an appellation which, in its moſt extenſive ſenſe, comprehends all the deſcendants of the celebrated patriarch Abraham, who was the father and founder of the Jewiſh nation; but, in its more reſtricted ſenſe, it includes thoſe who belonged to the tribe of Judah, and who inhabited Judea. Although they have been uſually diſtinguiſhed by this denomination, it is a name that was not given them till after the Babyloniſh captivity, when the tribe of Judah became the moſt conſiderable of what was left of Iſrael. In preceding times they were denominated Iſraelites, or more commonly Hebrews. For the etymology of this latter appellation, ſee HEBER. Under this title they occupied the *Land of* CANAAN, (which ſee,) whither their progenitor Abraham had migrated, and where he ſettled in the year B.C. 1921. (See ABRAHAM.) The ſubſequent poſſeſſors of it were the Iſraelites, ſo denominated from the name of Jacob, among whoſe 12 ſons, forming ſo many diſtinct tribes, it was partitioned in the manner already ſtated under the article *Land of* CANAAN. (See alſo JUDAH, JUDEA, and PALESTINE.) When the patriarchal government, which ſeems to have ſubſiſted in the early ages of the world, became impracticable (ſee PATRIARCHAL); the form of the Hebrew government underwent a material change, and was ſubject to various revolutions from the commencement of the national polity of the people of Iſrael, or Jews, to its final diſſolution. While they ſojourned in Egypt, it is natural to imagine, that as long as Jacob and Joſeph lived, they were their own maſters, and were governed by their own laws; and though they were afterwards enſlaved by the Egyptians, they nevertheleſs had ſome form of civil government among them, exerciſed by perſons under the denomination of Elders; who are ſuppoſed to have been the wiſeſt and graveſt men, in the higheſt eſteem among them, or, as Mr. Selden conjectures, the heads of their tribes. During their migration through the wilderneſs, from Egypt to Canaan, the Theocracy was eſtabliſhed. (See THEOCRACY.) As God was their king, Moſes was his viceroy, in whom the ſupreme power, eccleſiaſtical as well as civil, under God, was lodged. By him Aaron and his ſons were put into the prieſthood; the royal palace, or tabernacle, was built by his direction; by him it was conſecrated; he gave the nation the whole body of their laws; he was commander-in-chief of all their forces. Whatever Moſes did, he did by commiſſion from God; and though he was only God's lieutenant or viceroy, he was, on account of an authority, which he held only in ſubordination to God, called king in Jeſhurun. (Deut. xxxiii. 5.) Upon the entrance of the Iſraelites into the land of Canaan, B.C. 1451, under the conduct of Joſhua, he became, in conſequence of an oracular appointment, and in conſequence of having been inveſted with the office, while Moſes was living, the ſucceſſor of Moſes. (Numb. xxvii. 15—23.) And after his death, the people acknowledged Joſhua for his ſucceſſor, ſtipulating to render him that obedience which they had paid to Moſes. (Joſh. i. 16, 17.) In the year B.C. 1445, Joſhua divided the land of Canaan among the 12 tribes; and died in the year B.C. 1426. Some have ſaid that Joſhua was ſucceeded by the Judges. But it has been doubted, and not without reaſon, whether the Judges were properly ſucceſſors to Joſhua in the ſame office, as he had been to Moſes. The legiſlative office which Moſes had poſſeſſed having expired at his death, ſo, it is ſaid, did the office of Joſhua, as "præfectus ordinarius," and captain-general for his life, at his. Upon this the Hebrew government became ariſtocratical; excepting that, in reſpect to the peculiar ſupremacy of Jehovah, it was monarchical. In the Hebrew commonwealth every city had its elders, who formed a court of judicature, with a power of determining leſſer matters in their reſpective diſtricts. Each tribe had alſo its reſpective prince; theſe are called the heads of the thouſands of Iſrael (Numb. x. 4.), and were, perhaps, the ſame with the 12 captains of the hoſt, mentioned in the 2d chapter of Numbers; and their office, therefore, related chiefly, if not entirely, to military affairs. We alſo read of the princes of the congregation, who preſided in judiciary matters. (Numb. xxxii. 2. Joſh. ix. 15. xvii. 4.) They are called elders, princes, and nobles, on account of the dignity of their office (Exod. xxiv. 9. 11.), and they were 70 in number. (Numb. xi. 16, 17. 24, 25.) See SANHEDRIM. As for the judges, of whom we read after the death of Joſhua, they ſeem to have been appointed only on particular occaſions; but were not "præfecti ordinarii," like Moſes and Joſhua; nor were they continued in their office during life, but only as long as there was occaſion for their ſervice. (See JUDGES.) The firſt of theſe judges was Othniel, who, in the year B.C. 1405, the 40th year after the peace eſtabliſhed in the land by Joſhua, gave reſt to Iſrael. The 2d judge was Ehud the Benjamite, B.C. 1325; he was ſucceeded by Deborah the propheteſs, B.C. 1285, who with Barak the general of the Iſraelites defeated the Canaanites under Siſera: the 4th judge was Gideon, B.C. 1245, who routed the Midianites, but declined the offer of kingly power: the 5th judge was Tola, B.C. 1233: the 6th was Jair, B.C. 1210: the 7th was Jephthah, B.C.

1188; the 8th was Ibzan, B C. 1182; the 9th was Elon, B.C. 1175; the 10th was Abdon, B.C. 1165; the 11th was Eli, the high prieſt, B.C. 1157; the 12th and laſt judge was Samuel, B.C. 1116. (See Captivity.) We have here followed the chronology of Blair's Tables. The Judges were ſucceeded by kings, who were of two ſorts; *viz.* thoſe that reigned over the whole Hebrew nation, and who were only three, Saul, David, and Solomon; and thoſe that reigned over ſome of the tribes only. Saul began his reign in the year B.C. 1095, and having reigned 40 years, was ſucceeded by Iſhboſheth his ſon, who reigned ſeven years over part of Iſrael; and had for his ſucceſſor David, who was anointed to be king after Saul by Samuel, B.C. 1093, and who became ſole king, B.C. 1048. Having reigned wholly and in part 40 years, he was ſucceeded by his ſon Solomon, B.C. 1015, who died B.C. 975. After his death the kingdom was divided. The kings of the houſe of David, beginning with Rehoboam, were 20 in number, if we reckon Athaliah the queen, who uſurped the throne for ſix years, after the death of her ſon Ahaziah. (2 Kings, xi.) Theſe kings reigned over the two tribes of Judah and Benjamin, until Nebuchadnezzar carried Zedekiah, the laſt of them, captive to Babylon, B.C. 587. They took their title from the larger tribe, and were called kings of Judah. The kings of Iſrael, who reigned over the other ten tribes, from the time of their rebellion againſt Rehoboam, the ſon of Solomon, to the Aſſyrian captivity, were of ſeveral different families, and were in all 19 from Jeroboam, the firſt, B.C. 975, to Hoſea or Hoſhea, the laſt, B.C. 721, when the Iſraelites were carried into captivity, and their kingdom terminated after a duration of 253 years.

As the Hebrew nation was divided into two diſtinct kingdoms, ſo each kingdom ſuffered a diſtinct captivity; the one called the Aſſyrian, the other the Babyloniſh. For an account of each, ſee Captivity.

When Cyrus, having conquered Babylon, and almoſt all the weſtern parts of Aſia, iſſued a decree B. C. 536, for the return of the Jews from their captivity and the rebuilding of their temple; many of them, particularly of the tribes of Judah and Benjamin, gladly availed themſelves of the liberty; and ſome, even of the ten tribes, joined themſelves to the reſt, and returned with them to their own land. Many, however, choſe to remain where they were; and indeed had been already ſo widely diſperſed, during the years that had elapſed ſince the Aſſyrian captivity and formed permanent ſettlements, that they had neither opportunity nor inclination for returning with their brethren. Many enquiries have been made concerning the diſperſed Jews of the ten tribes; and it has been till of late a prevalent opinion, that they were either wholly loſt, or that they had at different times found their way in detached bodies to their own country. In conſequence of ſome late diſcoveries, there is reaſon to believe, that they ſtill exiſt in various parts of the Eaſt. Under the articles Afghans and Captivity, we have already ſtated the reſult of ſome enquiries with reſpect to the Jews of theſe tribes; and we have derived farther information from the reſearches of the Rev. Dr. Claudius Buchanan, lately publiſhed, Cambridge, 1811. Whilſt this author was in the Eaſt, he heard that Jews exiſted in diſtinct colonies in certain parts of India; that ſome of them had arrived there long before the Chriſtian era, and had remained in the midſt of the Hindoos to this time a diſtinct and ſeparate people, perſecuted by the native princes from age to age, and yet not deſtroyed. The author alſo noticed the exiſtence of an ancient colony of Jews on the coaſt of Malabar, particularly at Cochin. Being at Cochin in February 1807, he formed an acquaintance with the Jews; and found that they live in a town about a mile diſtant from Cochin, called "Jews' Town." It is almoſt wholly inhabited by the Jews, who have two reſpectable ſynagogues. Jews from remote parts of Aſia reſide here, and as they have conſtant communication by ſhips with the Red ſea, the Perſian gulf, and the mouths of the Indus, this place is the fountain of intelligence concerning that people in the Eaſt. The reſident Jews are divided into two claſſes, called the "Jeruſalem or White Jews," and the "Ancient or Black Jews." The former reſide at this place; the latter have alſo a ſynagogue here, but the great body of that tribe inhabit towns in the interior of the province. With regard to the hiſtory of the White Jews, our author obtained a written narrative, in the Hebrew language, of their arrival in India, which has been handed down to them from their fathers; and they exhibited to him an ancient braſs plate, containing their charter and freedom of reſidence, given by a king of Malabar. Of their firſt arrival this narrative records, that after the deſtruction of the ſecond temple, their fathers, dreading the conqueror's wrath, departed from Jeruſalem, a numerous body of men, women, prieſts, and Levites, and came into this land. They had among them men of reputation for learning and wiſdom; and God gave the people favour in the ſight of the king who then reigned here, and he granted them a place to dwell in, called "Cranganor." He allowed them certain privileges, and the royal grant was engraved on a plate of braſs. This was done in the year from the creation of the world 4250 (A. D. 490); and this plate of braſs is ſtill in their poſſeſſion. "Our forefathers," they ſay, "continued at Cranganor for about 1000 years, and the number of heads who governed were 72. Soon after our ſettlement, other Jews followed us from Judea; and among theſe came that man of great wiſdom, Rabbi Samuel, a Levite of Jeruſalem, with his ſon Rabbi Jehuda Levita. They brought with them the "ſilver trumpets," made uſe of at the time of the "Jubilee," which were ſaved when the ſecond temple was deſtroyed; and we have heard from our fathers, that there were engraven upon thoſe trumpets the letters of the ineffable name. There joined us alſo from Spain and other places, from time to time, certain tribes of Jews who had heard of our proſperity. But at laſt, diſcord ariſing among ourſelves, one of our chiefs called to his aſſiſtance an Indian king, who came upon us with a great army, deſtroyed our houſes, palaces, and ſtrong holds, diſpoſſeſſed us of Cranganor, killed part of us, and carried part into captivity. By theſe maſſacres we were reduced to a ſmall number. Some of the exiles came and dwelt at Cochin, where we have remained ever ſince, ſuffering great changes from time to time," &c. &c. The native annals of Malabar confirm the foregoing account in the principal circumſtances; as do the Mahometan hiſtories of later ages; for the Mahometans have been ſettled here in great numbers ſince the eighth century.

Our author farther informs us, that by looking at the countenance of the "Black Jews," you may be ſatisfied that their anceſtors muſt have arrived in India many ages before the "White Jews." Their Hindoo complexion, and their very imperfect reſemblance to the European Jews, indicate that they have been detached from the parent ſtock in Judea many ages before the Jews in the Weſt; and that there have been intermarriages with families not Iſraelitiſh. The White Jews look upon the Black Jews as an inferior race, and as not of a *pure* caſt; and this circumſtance plainly demonſtrates, that they do not ſpring from a common ſtock in Judea. The Black Jews gave our author much intereſting information; and recounted the names of many other ſmall colonies reſident in Northern India, Tartary, and China, and gave a written liſt of 65 places. Upon inquiring of them concerning the ten tribes, they ſaid that it was commonly believed among them, that the great body of the Iſraelites are to be found in Chaldea; and in the countries contiguous to it; being the very places whither they were firſt carried into captivity; that ſome few families had migrated into regions more remote, as to Cochin and Rajapoor in India, and to other places yet farther to the Eaſt; but that the bulk of the nation, though now much reduced in number, had not to this day removed 2000 miles from Samaria. Our author afterwards made a tour through the towns of the Black Jews, in the interior of the country, Tritoor, Paroor, Chenotta, and Malch; and he found many MSS., chiefly in the Rabbinical character. One of theſe is an old copy of the books of Moſes, written on a roll of leather. The ſkins are ſewed together, and the roll is about 48 feet in length. Some of the Jews ſuppoſe that this roll came from Senna, in Arabia; others have heard that it was brought from Caſhmire. The Cabul Jews, who travel into the interior of China, ſay, that in ſome ſynagogues the law is ſtill written on a roll of leather made of goats' ſkins dyed red; not on vellum, but a ſoft flexible leather.

Whilſt our author was amongſt the Jews of Malabar, he made frequent inquiries concerning the ten tribes. When he mentioned, that it was the opinion of ſome that they had migrated from the Chaldean provinces; he was aſked to what country we ſuppoſed they had gone, and whether we had ever heard of their moving in a great army on ſuch an expedition. It will be eaſy perhaps to ſhew that the great body of the ten tribes remain to this day in the countries to which they were firſt carried captive. We learn from Joſephus, who lived in the time of Veſpaſian, and who recites a ſpeech made by king Agrippa to the Jews, exhorting them to ſubmit to the Romans; that the ten tribes were then captive in Media under the Perſian princes: and Jerome, in the fifth century, treating of the diſperſed Jews in his notes on Hoſea, ſays, unto this day the ten tribes are ſubject to the kings of the Perſians, nor has their captivity ever been looſed. And again, the ten tribes inhabit at this day the cities and mountains of the Medes. No family dares to leave the kingdom of Perſia without permiſſion of the king. In the provinces of Caſhmire and Affghaniſtan, ſome of the Jews ſubmitted to great ſacrifices, and remain Jews to this day; but the greater number yielded, in the courſe of ages, to the power of the reigning religion. Their countenance, their language, their names, their rites and obſervances, and their hiſtory, all conſpire to eſtabliſh the fact. Mr. Forſter (Travels) was ſo much ſtruck with the general appearance, garb, and manners of the Caſhmirians, as to think, without any previous knowledge of the fact, that he had been ſuddenly tranſported among a nation of Jews. The tribes of the Affghan race are very numerous, and of different caſts, extending on both ſides of the Indus, and the mountainous region, which commences in Weſtern Perſia; ſome of theſe tribes are evidently of Jewiſh extraction. Our author, however, concludes upon the whole, that the greater part of the ten tribes, which *now exiſt*, is to be found in the countries of their firſt captivity. But to return from this digreſſion——.

Although ſome of the ten tribes returned on the occaſion above-mentioned, moſt of them remained among the heathens. This appears to have been the caſe in the reign of Artaxerxes Longimanus, ſuppoſed by Prideaux to be the Ahaſuerus mentioned in the book of Eſther, and this muſt have been nearly eighty years after their firſt return in the reign of Cyrus, B. C. 458. It was at this time that Ezra obtained an ample commiſſion from Artaxerxes for his return to Jeruſalem, with all of his own nation who were willing to accompany him. (Ezra, ch. vii.) Upon this many more of the Jews returned to their own land. Nevertheleſs, few of the ten tribes, in compariſon of thoſe of Judah and Benjamin, ever returned from their diſperſion. It appears, that at the time of Haman's conſpiracy, probably four or five years after the ſecond return under Ezra, there was a multitude of the Jews diſperſed through the various provinces of the Perſian empire; beſides thoſe who had mingled with idolaters and embraced their religion. Ezra, who was governor of the Jews in their own land for thirteen years, was ſucceeded by Nehemiah, who had a new commiſſion granted him by Artaxerxes in the 20th year of his reign, B. C. 445, with full authority to repair the wall of Jeruſalem, and to fortify it in the ſame manner as before it was diſmantled by the Babylonians.

The Jews, who, after the return from the captivity, were ſettled again in their own land, were no longer divided into two kingdoms, but formed one people under one government, which varied in its form through ſeveral ſucceeding ages. Upon their return from the captivity, Judea became a province of Syria, tributary to the ſovereign of the Perſian empire. But though tributary, the Jews enjoyed their own religion, and were governed by their own laws; and their governors, though they acted by virtue of a commiſſion from the court of Perſia, were, nevertheleſs, of their own nation; as Zerubbabel, Ezra, and Nehemiah; ſo that the adminiſtration of the Jewiſh ſtate was committed to their high-prieſts. This ſtate of things, and this form of government, continued for upwards of 200 years, until the time of Alexander the Great, who, having deſtroyed the Perſian empire, B.C. 331, and eſtabliſhed the Grecian univerſal monarchy, reduced the Jews into a ſtate of ſubjection to him and his ſucceſſors. But they were not properly conquered by him, as the other nations were; but obtained his protection in the ſingular manner related by Joſephus, Antiq. l. xi. c. 8. 5. 3—5. edit. Havre. (See JERUSALEM.) Jaddua, the Jewiſh high-prieſt, having ingratiated himſelf with Alexander by his prudent conduct, and by ſhewing him the prophecy of Daniel, which predicted the overthrow of the Perſian empire by a Grecian king, and being ordered to requeſt on behalf of the Jews whatever was agreeable to them, petitioned that they might enjoy their own laws and religion, and be excuſed from paying tribute every ſeventh year, becauſe in that year they neither ſowed nor reaped. All this was freely granted by Alexander. After the death of Alexander, the Jews became ſubject and tributary to the kings of Egypt or Syria, as by various events one or the other extended their dominion to Judea, which lay between theſe two countries. After a ſevere conteſt, Judea was ſubdued by Ptolemy, and 100,000 Jews were made captive; but afterwards, reflecting on their accuſtomed fidelity to their conquerors, he reſtored to them all the privileges which they had enjoyed under the Macedonians. Five years after the ſubjugation of Judea by Ptolemy, he was forced to ſurrender it to Antigonus, the Macedonian general, who treated the Jews in a manner ſo tyrannical, that many of them fled into Egypt, and others put themſelves under the protection of Seleucus Nicator, king of Syria, who granted them conſiderable privileges. At this time Judea ſeemed to be in danger of depopulation, till it was recovered by Ptolemy Soter in the year B.C. 292. The proſperity of the Jews, however, was of ſhort duration; for under the reign of Ptolemy Philopator they were grievouſly oppreſſed by the incurſions of the Samaritans, whilſt Antiochus Theos, king of Syria, invaded Galilee. Antiochus, however,

ever, was defeated by Ptolemy, who, being reſiſted by the Jews in his attempt to profane the temple, raiſed againſt them a dreadful perſecution; but this perſecution being ſtopped, the Jews were again received into favour. When Ptolemy Epiphanes ſucceeded his father Philopator, B.C. 204, Antiochus, the great king of Syria, invaded Paleſtine; and the Jews, unmindful of their obligations to the kings of Egypt, joined the invader. In recompence of the ſervices which they rendered him, Antiochus propoſed to reſtore their metropolis to its ancient ſplendour, liberty, and privileges, and to recal all thoſe Jews who had been driven out of it; and from ſingular reſpect to the temple of their God, he granted them 20,000 pieces of ſilver towards the charges of their worſhip, 1400 meaſures of fine wheat, and 375 meaſures of ſalt, for their uſual oblations. He alſo declared his intention to repair the temple at his own coſt, to allow them the free exerciſe of their religion, to reſtore the public ſervice, and the prieſts, Levites, &c. to their uſual functions; and beſides other privileges which he conferred upon them, he granted an exemption from all taxes for three years to all the diſperſed Jews that ſhould come within a limited time to repeople that metropolis. By theſe and other extraordinary favours, Antiochus ſo attached the Jews to his intereſt, that Judea, and the other neighbouring provinces, readily ſubmitted to him. Upon the death of Antiochus, their friend and protector, B.C. 187, they found as kind a patron in his ſon and ſucceſſor, Seleucus Philopator. Judea at this time enjoyed a profound peace, and their laws were obſerved with great ſtrictneſs under their worthy high-prieſt, Onias III., until a miſunderſtanding, which occurred between him and Simon, a Benjamite, who had been made governor of the temple, brought a ſeries of evils on the Jewiſh ſtate. Simon treacherouſly communicated information to Seleucus, that the temple of Jeruſalem contained immenſe treaſures, which might be ſeized for his uſe. Heliodorus was diſpatched to Jeruſalem for this purpoſe; and having acquainted Onias with the king's orders, which he was commiſſioned to execute, the prieſt remonſtrated, and endeavoured to diſſuade him from any attempt of this kind. Heliodorus, however, endeavoured to force the temple, but whilſt the Syrians were endeavouring to enter, they were ſmitten with ſuch a panic, that they fell down half-dead. When the traitor Simon found that he had miſſed his aim, he laid the whole blame on the good high-prieſt, pretending that he was the perſon who had called Heliodorus to Jeruſalem, and thus raiſed a party againſt him. Onias, fearing the conſequences of ſuch a faction, went to Antioch to complain of this outrage to the king. He was well received, and Simon was baniſhed; but Seleucus, dying ſoon after, B.C. 175, was ſucceeded by his ſon Antiochus Epiphanes, generally ſuppoſed to be that "vile perſon," of whom Daniel propheſied under that appellation (chap. xi. 21, &c.), and he actually proved altogether as profane and cruel as the prophet repreſents him; for he laid ſiege to Jeruſalem, and took it by ſtorm, and in the courſe of two days maſſacred 40,000 of its inhabitants, and ſold as many more to the neighbouring nations for ſlaves. He impiouſly found his way into the temple, and into the holy of holies; he ſacrificed a great ſow upon the altar of burnt-offerings, and cauſed broth to be made of ſome part of the fleſh, and to be ſprinkled all over the temple. He afterwards plundered the ſacred edifice of all its golden and ſilver veſſels and utenſils, to the value of 1800 talents of gold; and having made a ſimilar plunder in the city, he left it, after he had, to the further vexation of the Jews, appointed Philip, a Phrygian, to be their governor, who was a man of a cruel and barbarous temper; and the apoſtate Menelaus, the brother of Onias, who had been baſely murdered, in the poſſeſſion of the high prieſthood, B.C. 170. It would be tedious to enumerate the horrid acts of cruelty which were committed under the authority and direction of Antiochus, than whom we cannot conceive a greater monſter of barbarity. Not ſatisfied with the ſavage and brutal meaſures that were executed againſt the Jews, he determined either totally to aboliſh their religion, or to exterminate their whole race. Accordingly he iſſued a decree, that all nations within his dominions ſhould conform to his religion, and worſhip the ſame God, and in the ſame manner that he did, under the ſevereſt penalties. This decree being levelled chiefly againſt the Jews, he ſent commiſſioners to execute it in Judea. One of theſe, named Apelles, came to Modin, where dwelt Mattathias, a very honourable prieſt, and zealous for the law of his God; he was the great-grandſon of Aſmonæus, from which circumſtance the family probably derived the name of Aſmonæans. This Mattathias, with his five ſons, were tempted, by the moſt ample promiſes of protection and favour, on the part of the king, to renounce their religion. But he contemned the offer, and magnanimouſly declared, that if the whole Jewiſh nation, and even the whole world, were to conform to the king's edict, he and his ſons would continue faithful to their God to the laſt moment of their lives. At the ſame time, perceiving one of his countrymen juſt going to offer ſacrifices to an idol, he fell upon him and inſtantly killed him, agreeably to the requiſition of the Moſaic law in caſes of that kind. Upon this, his ſons, actuated by ſimilar zeal, killed the king's officer and his men; overthrew the altar and idol; and running about the city, cried out, that thoſe who were zealous for the law of God ſhould follow them. They then retired into the mountains, whither they were followed by many of the Jews; and having there formed an army, ſtood upon their defence. Afterwards, leaving their faſtneſſes, they went about the country deſtroying the heathen altars and idolaters, and reſtoring the worſhip of God according to the law, wherever they came. Mattathias, who died B.C. 166, was ſucceeded by his ſon Judas, ſurnamed Maccabeus (ſee Maccabees), who was one of the moſt diſtinguiſhed heroes of whom the Jews can boaſt. His army conſiſted only of 6000 men; but the deficiency of number he ſupplied by his zeal and bravery. Of his ſignal exploits and various conqueſts, we cannot here give a minute detail. It muſt ſuffice to obſerve, that having rid the province of Judea of the enemy, he marched to the metropolis, purified the city and temple, reſtored the altars, holy place, and worſhip; commencing the religious ſervice with the dedication of the new altar, and other holy utenſils, which was performed on the 25th day of the month Ciſleu; the ſame day in which it had ceaſed by the profanation of the temple three years before, and in the ſecond year of Judas's government. The news of Judas's ſucceſs exaſperated Antiochus Epiphanes almoſt to madneſs; and he ſtill retained his purpoſe of extirpating the Jewiſh race. But he had ſcarcely uttered his purpoſe, before he was ſeized with a pain in his bowels of the moſt excruciating nature, and this diſeaſe, accompanied with ſtill more agonizing reflections and feelings of mind, terminated in his death, B.C. 164. Judas ſtill purſued his ſucceſsful military operations; till at length the Syrians were under a neceſſity of ſuing for peace, B.C. 163. This year, in Blair's Tables, is the era of the government of Judea by the Aſmoneans or Maccabees, which laſted 126 years. The peace between the Syrians and Judas was of ſhort duration. Upon the renewal of the war, Judas defeated them in five engagements; but in the 6th he was abandoned by all his men except 800 who, together with their chief; were ſlain in a ſevere conteſt, which laſted from morning till evening, B.C. 161. The Jews were much afflicted by the death of Judas. He was ſucceeded, however, by his brother Jonathan, who conducted their concerns with no leſs prudence and ſucceſs than Judas, till, after having governed the Jewiſh ſtate near 17 years, he was decoyed into the power of Tryphon, a Syrian uſurper, and ſoon after murdered, B.C. 144. Simon, the only ſurviving ſon of Mattathias, ſucceeded his brother Jonathan: who fruſtrated all the hoſtile deſigns of the traitor Diodotus, called Tryphon, againſt Judea. Simon was not only appointed commander-in-chief of the forces of the Jews, but promoted to the dignity of high-prieſt, in which office he was ſolemnly inſtalled. This pontiff renewed the alliance with Rome and Sparta; repaired and fortified all his garriſons, eſpecially that of Bethſura, on the confines of Judea; took Joppa and Gaza; and drove out the Syrian garriſon from Acra, the fortreſs of Jeruſalem. The wife of Demetrius, who had been driven from his dominions, and kept priſoner by the Parthians, deſpairing ever to recover her captive huſband, invited his brother Antiochus to make an effort for gaining the Syrian crown. Upon his arrival, he ſent a very obliging letter to the Jewiſh high-prieſt, in which he confirmed to him all his dignities, revenues, and authority; and to his nation all the freedom and immunities which had been formerly granted by his brother to them, or which they now actually poſſeſſed. To this he added, beſides many great promiſes, a power of coining their own money in Judea, of which that pontiff immediately availed himſelf. But when that prince had eſtabliſhed himſelf on the throne by the marriage of Cleopatra, and the death of Tryphon, Simon, either ſuſpecting the ſincerity of his late promiſes, or being deſirous of making his friendſhip to him appear more conſiderable, ſent a freſh embaſſy to Rome, to renew and ſtrengthen his alliance with that nation. Simon was at laſt treacherouſly murdered by his ſon-in-law Ptolemy, about the year B. C. 135. The ſucceſſor of Simon, both as prince and high-prieſt, was his ſon Hyrcan, who immediately adopted meaſures for the ſafety of his own perſon, as well as that of the city and country. Having ſucceeded in throwing off the Syrian yoke, he turned his arms againſt the Samaritans, took their capital Samaria, made himſelf maſter of Paleſtine, and added to it all the provinces of Samaria and Galilee; all which he enjoyed to the end of his life. His reign was no leſs remarkable on account of his great wiſdom and piety at home than his conqueſts abroad. Never did the Jewiſh religion or commonwealth appear with greater luſtre ſince the return from the captivity; but that which raiſed his glory above any of his predeceſſors, or ſucceſſors, was, if we may believe Joſephus (Bell. Jud. l. ii. c. 3.), and the 4th book of Maccabees, his enjoying three dignities, which never all concurred in any one beſides himſelf; *viz.* the royal dignity, the high-prieſthood, and the gift of prophecy. Of the laſt-mentioned, however, the inſtances that are produced are very equivocal and liable to great ſuſpicion. The laſt year of Hyrcan's reign was much imbittered by a quarrel with the Phariſees, to whom he had been always partially attached; and this contention is thought to have ſhortened his days. One of the Phariſees ſuggeſted a doubt of his legitimacy, alleging that his mother had formerly been a ſlave, and conſequently, that he was incapable of enjoying the high-prieſthood. This report was credited, or at leaſt pretended to be ſo, by the whole ſect; and it irritated Hyrcan to ſuch a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Phariſees, who occaſioned all the troubles and ſeditions that diſturbed the cloſing period of his life. Hyrcan died in the year B. C. 107; and was ſucceeded by his ſon Ariſtobulus, who manifeſted himſelf to be a moſt cruel and barbarous tyrant. His power was happily of ſhort duration; for in the year B. C. 106, he was ſucceeded by his brother Alexander Jannæus, who was, next to king David, the greateſt conqueror that ever ſat on the Jewiſh throne. His abode at Jeruſalem was rendered very undeſirable by the tumults excited by the Phariſees; and he therefore left the city to ſuch foreign enemies and conqueſts. During his abſence the Phariſees raiſed a rebellion at home, which was terminated in the year B. C. 86, when the rebels were treated with great inhumanity. Alexander, having made ſeveral conqueſts in Syria, died in the year B. C. 79. Although he left two ſons, Hyrcanus and Ariſtobulus, he bequeathed the government of the kingdom to his wife Alexandra during her life, and then to either of his ſons whom ſhe might think proper to appoint. The Phariſees diſquieted her adminiſtration; and nothing leſs would ſatisfy them than the total extermination of their adverſaries, the Sadducees, who were grievouſly perſecuted for four years, and then, for their future ſecurity, diſperſed among the ſeveral garriſons of the kingdom. When her death ſeemed to be approaching, Ariſtobulus collected a party to ſecure the crown to himſelf; but the queen, having before made Hyrcanus high-prieſt, appointed him to ſucceed her in the royal dignity. At her deceaſe, ſhe left her two ſons competitors for the crown. In a conteſt between the two brothers, Hyrcanus was compelled to abandon all title both to the royal and pontifical dignity. His party, however, was not extinguiſhed. Antipater, father of Herod the Great, took part with Hyrcanus, and having carried him off into Arabia, under a pretence that his life was in danger in Judea, he intereſted Aretas, king of that country, in his behalf; who, with a view of reſtoring him to the throne, invaded Judea, and defeated Ariſtobulus. This prince had recourſe to the Romans, who, under the command of Scaurus, defeated Aretas, with the loſs of 7000 men, and drove him out of the country. The two brothers afterwards appealed to Pompey, who was at that time commander-in-chief of all the Roman forces in the Eaſt, and made him the arbitrator of their differences. He deferred giving an opinion, with a promiſe that, as ſoon as he had ſubdued Aretas, he would come into Judea and divide their controverſy. Ariſtobulus was offended, and on the other hand Ptolemy reſented the want of reſpect on his part, and, entering Judea with his troops, ſummoned Ariſtobulus to appear before him. From the behaviour of Pompey, Ariſtobulus perceived that he was in the intereſt of his brother, and accordingly he fled to Jeruſalem, with a deſign of exerting himſelf to the utmoſt of his power againſt the Romans. Pompey followed him, and ſoon brought him to abject ſubmiſſion. The citizens of Jeruſalem demurred, and the garriſon ſhut the gates againſt Pompey. Exaſperated by this conduct, he beſieged and took the city, B. C. 63, and reſtored Hyrcanus to the prieſthood and alſo the government, with the title of "Prince;" but forbidding him to aſſume that of "King," to wear a diadem, or to extend his territories beyond the limits of Judea. Pompey, having thus ſubdued the Jewiſh nation, ſet out for Rome, and carried with him Ariſtobulus, with his two ſons, Alexander and Antigonus, and his two daughters, to adorn his future triumph. Alexander, however, found means to make his eſcape into Judea, where he raiſed an army, and having fortified ſome ſtrong holds, made incurſions into the neighbouring country. Hyrcanus ſunk into his natural indolence, and left the management of public affairs to Antipater, who, for purpoſes of perſonal and family aggrandizement, ingratiated himſelf with the Romans. Hyrcanus was in no condition to oppoſe Alexander; and therefore again beſought the aſſiſtance of the Romans. Alexander ventured a battle, and was defeated; but, by the intereſt of his mother with the Roman general, obtained a pardon for his paſt aggreſſions. Hyrcanus was again reſtored to the pontifical dignity; and the province was divided into five diſtricts, having each a ſeparate court of judicature. The firſt of theſe was at Jeruſalem; the ſecond at Gadara; the third at Amath; the fourth at Jericho; and the fifth at Sephoris in Galilee. The government of Judea was now changed into an ariſtocracy. The war between Pompey and Cæſar afforded the Jews ſome reſpite; and favoured the ambitious projects of Antipater. Cæſar confirmed Hyrcanus in his prieſthood; added to it the principality of Judea, which was entailed on him and his poſterity for ever; and reſtored the Jewiſh nation to their ancient rights and privileges; and ſoon after, when Cæſar himſelf came into Judea, he granted liberty to fortify the city, and to rebuild the wall which Ptolemy had demoliſhed. During the life of Cæſar the Jews were highly favoured, and might be ſaid ſcarcely to feel the Roman yoke; but after his death, B. C. 44, their condition underwent a material change. Antigonus, ſon of Ariſtobulus, brother of Hyrcanus, by means of ſome friends he had among the Jews, and by the aſſiſtance of the Parthians, made himſelf maſter of Jeruſalem and all Judea, and took Hyrcanus priſoner, who was put into the hands of the Parthians. This circumſtance, and ſeveral others occurred, which embroiled Judea; nor were the tumults and diſorders of this province quelled till Herod viſited Rome, and was created king of Judea by the friendſhip and intereſt of Marc Antony and Octavius, in the year B. C. 40. The view of Herod, in his journey to Rome, was to obtain the kingdom of Judea for Ariſtobulus, brother of his wife Mariamne, by his father, grandſon of Ariſtobulus, and by his mother, of Hyrcanus. But the ſenate of Rome, by the recommendation above-mentioned, and alſo moved by ſome reaſons of ſtate, conferred the kingdom of Judea upon Herod. Having had this unexpected ſucceſs at Rome, he returned with all expedition to Judea, and in about three years' time, B. C. 37, got poſſeſſion of the whole country. When Jeruſalem was taken by Soſius and Herod, and by the death of Antigonus, beheaded by order of Marc Antony, at the requeſt of Herod, the Aſmonean family terminated, 126 years after Judas Maccabæus. Herod was a perſecutor and tyrant; he began his reign with the death of many of the adherents of his rival Antigonus, and with the confiſcation of their effects. He alſo decoyed Hyrcanus, the baniſhed pontiff, from Parthia, that, notwithſtanding his moſt ſolemn promiſes to the contrary, he might put him to death. His own family did not eſcape his cruelty. He had married Mariamne, the daughter of Hyrcanus; whoſe brother, Ariſtobulus, was made high-prieſt at the interceſſion of his mother; but the tyrant, knowing that Ariſtobulus had a better right to the kingdom than himſelf, cauſed him to be drowned in a bath; and then ſacrificed his own wife Mariamne. Her death was ſoon followed by that of her mother Alexandra, and this by the execution of ſeveral other perſons, who had united their endeavours with her's for ſecuring the kingdom to the ſons of the deceaſed queen. His contempt of the Jewiſh ceremonies, and introduction of a number of heatheniſh games, expoſed him to the danger of aſſaſſination; but the conſpirators, failing in their attempt, were afterwards diſcovered by ſome women, who were put to the rack, and ſentenced to ſuffer death, together with their families. Having thus diſpoſed the people to a revolt, he found it neceſſary to fortify Jeruſalem with additional works, to rebuild Samaria, and to garriſon ſeveral fortreſſes in Judea. Although the relief which he afforded to his ſubjects in a time of famine ſerved in ſome meaſure to allay their hatred and animoſity; yet, by relapſing into his former cruelty, their hatred of him was renewed, nor did it ſubſide till his death. About the year B. C. 23, he began to adorn the chief cities with ſumptuous buildings, and to rebuild the temple. (See JERUSALEM and TEMPLE.) But all theſe works were not ſufficient to divert the king's attention from his uſual jealouſy and cruelty. Prompted by his ſiſter Salome, and one of his ſons, Antipater, he murdered his two ſons by Mariamne, Alexander and Ariſtobulus; but his cruelty and jealouſy were pre-eminently diſplayed in his attempt to deſtroy the Saviour of the world. At length he was ſeized with a loathſome and incurable diſeaſe, which terminated in his death, very much to the joy of his ſubjects, Nov 25th, B.C. 4. He had previouſly put Antipater to death, and divided his kingdom among his ſons in the following manner: Archelaus had Judea, but his power did not extend over the whole land of Iſrael, and particularly not to Galilee; Antipas, or Herod, was tetrarch of Galilee and Perea, and ſo continued till he was removed by Caligula, the ſucceſſor of Tiberius (ſee HEROD-ANTIPAS); and Philip had the regions of Trachonitis, Gaulonitis, Batanea, and Panias, which he erected likewiſe into a tetrarchy, and governed 37 years, till his death in the 20th year of Tiberius. For other particulars relating to *Herod* the Great; ſee his article. The death of Herod was followed by inſurrections and tumults. Archelaus was oppoſed by his brethren, and obliged to appear at Rome before Auguſtus, with whom many complaints were lodged againſt him. (See ARCHELAUS.) Upon the baniſhment of Archelaus, A.D. 6 or 7, Judea was reduced to a Roman province, and put under the government of Roman officers ſent from Rome; and appointed to be a branch of the province of Syria. But in order to keep this country of Judea in good order, there was an officer, with the title of procurator, ſent by Auguſtus, to reſide and govern there, inveſted with the ſupreme authority, or, as Lardner ſays, the power of life and death. The firſt of theſe was Coponius, the next Marcus Ambivius, his ſucceſſor Annius Rufus, in whoſe time Auguſtus died, A.D. 14. The next was Valerius Gratus, who was appointed procurator by Tiberius, and continued in the province 11 years; and was then ſucceeded by Pontius Pilate, who governed Judea during a period of ten years, which expired ſome time before the paſſover, A.D. 36. After the removal of Pilate, for about four or five years at the moſt, it may be queſtioned, whether the Jews had now any procurator reſiding among them with the power of life and death, as they had from the year of our Lord 7, to the year 36 or 37. But however this be, it is certain that they were ſubject to the Romans. For when the Samaritans, with whom the Jews are ſuppoſed to have joined, waited upon Vitellius, the preſident of Syria, intreating that Pilate might be removed, they made very ſolemn profeſſions of their willingneſs to continue under the Roman government, and only complained of the tyranny of Pilate. Dr. Lardner is of opinion, however, that they had no procurator reſiding among them from the time of Pilate's removal to Agrippa's acceſſion to the kingdom of Judea, in the reign of Claudius. In conſidering the circumſtances of the Jews in their own country at this time, as it is deſcribed by the writers of the New Teſtament, and other ancient authors, we may regard both their religious and civil ſtate. That they had, according to the ſacred writers, the free exerciſe of their religion, is evident from the whole tenor of the hiſtory contained in the Goſpels and the Acts of the Apoſtles. They had their ſynagogues, in which the law and the prophets were read, and in which our Saviour taught. In the whole hiſtory of our Saviour's miniſtry there is no mention of any reſtraint, or obſtruction which they met with in their worſhip, except that which occurs in Luke, xiii. 1. It appears alſo probable that they were at liberty to perform all their religious ſervices, if we conſider, that the Romans always permitted the people conquered by them to practiſe their own religious rites in their own way; nor do they ſeem to have departed from this principle till after the period of the evangelical hiſtory. Joſephus alſo aſſures us of this fact. The Roman governors did, indeed, ſometimes offer abuſes, or ſuffer abuſes to be committed in the country, contrary to the inſtitutions of the law; and they alſo injured them with reſpect to their civil property. But theſe abuſes do not ſeem to have been very numerous; when any were committed, it was without the emperor's authority; and, uſually, the Jews at length obtained ſatisfaction. In conſidering the civil ſtate of the Jews, Dr. Lardner diſtributes their hiſtory into four periods; *viz.* the firſt, which reaches from the preaching of John the Baptiſt to our Saviour's reſurrection; the ſecond, from thence to the time of Herod, the king, mentioned Acts, xii.; the third, the reign of this Herod; and the fourth, from the end of this reign to the concluſion of the evangelical hiſtory. In the inveſtigation of this ſubject, and the concluſions reſulting from it, learned men have entertained different opinions; particularly with regard to the extent of the power and authority poſſeſſed by the Jews, and with reſpect to the queſtion, whether they had the power of life and death, or only a right to inflict ſome leſſer penalties. This enquiry ſhould be reſtricted to the ſtate of the Jews in Judea, properly ſo called; and therefore it does not comprehend the beheading of John the Baptiſt, which was perpetrated by Herod, tetrarch of Galilee, ſon of Herod the Great; who, without doubt, had the power of life and death, however he abuſed it, in his own territories. With reference to the firſt period, we are aſſured by all the evangeliſts, that our Saviour was brought before Pilate, governor in Judea, during the whole time of our Saviour's miniſtry, and condemned by him; and he was crucified by Pilate's officers; and yet the Jews are more than once ſaid to have crucified Chriſt, becauſe his death was owing to their proſecution and importunity. Nor is it uncommon to aſcribe to men not only thoſe things which they themſelves do, but thoſe alſo which are brought about by their means. For the particular illuſtration of this ſubject, we muſt refer to Lardner's Works, vol. i. ed. 8vo. After adducing and examining, with his uſual accuracy and impartiality, the main paſſages of this period, concerning the power which the Jews poſſeſſed in their own country, he concludes with the following ſummary. They practiſed their own religious rites, worſhipped at the temple and in their ſynagogues, followed their own cuſtoms, and lived very much according to their own laws. They had their high prieſts, council or ſenate; inflicted leſſer puniſhments; they could apprehend men, and bring them before the council; and if a guard of ſoldiers was needful, could be aſſiſted by them, upon aſking the governor for them; they could bind men and keep them in cuſtody; the council could ſummon witneſſes, take examinations, and when they had any capital offenders, carry them before the governor. This governor uſually paid a regard to what they offered; and, if they brought evidence of the fact, pronounced ſentence according to their laws. But he was the proper judge in all capital cauſes; for when the council of the Jews had before them a caſe, which they pretended to be of this kind, having prepared it, they went with it immediately to the governor, who re-examined it, and pronounced the ſentence. Our learned author has examined and maturely conſidered the various occurrences of the three ſubſequent periods, and ſatisfactorily ſhewn, that whatever power the laws exerciſed with regard to the infliction of leſſer penalties, and however tumultuouſly and illegally they might have acted in particular caſes, they had no power of life and death. The arguments deduced from the facts ſtated by the evangelical hiſtorians are farther confirmed by the teſtimony of ancient writers. Ulpian, a famous Roman lawyer, expreſsly ſays, "The magiſtrates of municipal places (ſee MUNICIPAL *Cities*) may not puniſh a ſlave with death; but the inflicting leſſer penalties is not to be denied them." This ſingle authority is ſufficient to decide the queſtion. The Jews lived according to their own laws, as municipal people did; but then, if theſe laſt, who were Roman citizens, had not the right of puniſhing a ſlave with death, certainly the Jews had not, whilſt under the Roman government.

Soon after Pilate's depoſition, Caius Caligula promoted his old friend Agrippa to the regal dignity; but he did not long enjoy this honour. (See AGRIPPA.) On his death, A.D. 44, Judea was made a Roman province by Claudius, who ſent Cuſpius Fadus thither as governor; he was ſucceeded by Tiberius Alexander, an apoſtate Jew of ſacerdotal race, and nephew to the famous Philo. The ſubſequent governors were Ventidius Cumanus, Claudius Felix, mentioned Acts, xxiv., Portius Feſtus, before whom Paul made his famous defence (Acts, xxv. xxvi.), Albinus, nominated by Nero, who ſuppreſſed the Sicarii, or thoſe robbers who were at this time become very numerous in Judea, and Geſſius Florus, the laſt and worſt governor that Judea ever had, whoſe atrocious conduct prepared the way for that war, which terminated with the total ruin of the Jewiſh nation. During his flagitious government, great numbers of Jews forſook the province, and ſought an aſylum among foreign nations; whilſt thoſe that remained applied to Ceſtius Gallus, governor of Syria, who was at Jeruſalem at the paſſover, beſeeching him to pity their wretched ſtate, and free them from the tyranny of a man who had totally ruined their country. The number of people at Jeruſalem was found by computation to amount to 2,556,000. Joſephus thinks they rather amounted to 3,000,000. In May, A.D. 66, began the Jewiſh war with the Romans; it took its immediate riſe from a conteſt between the Jews and Syrians concerning the city of Cæſarea. The Jews maintained that it belonged to them, becauſe it had been built by Herod, and the Syrians pretended that it had been always conſidered as a Greek city. The deciſion of the diſpute was referred to Nero, whoſe determination produced an inſurrection on the part of the Jews, which rapidly ſpread through the whole country. Robberies, murders, and every kind of cruelty prevailed. The Jews, on their part, ſpared neither Syrians nor Romans, but retaliated their cruelties wherever they occurred. The Cæſareans fell ſuddenly on the Jews of their city, and maſſacred 20,000 of them; 2000 were murdered at Ptolemais; and 50,000 are ſaid to have been ſlaughtered at Alexandria. At Jeruſalem, Florus cauſed his troops one day to plunder the high market, and to kill all they met; and accordingly they murdered 3500 perſons, men, women, and children. In the mean time a great number of aſſaſſins, having joined the rebels, drove the Romans out of the fortreſſes of Maſſada, Antonia, and the towers of Phaſael, Mariamne, and others. They ſet fire to the palaces of Agrippa, Berenice, the high prieſt Ananias, and his brother Ezechias; and theſe two laſt perſons they murdered without mercy. The revolted Jews extended their conqueſts beyond Jordan, and took the fortreſſes of Machæron and Cyprus, which laſt they razed to the ground, after having put all the Romans to the ſword. At length Ceſtius Gallus was rouſed ; and having marched into Judea with a powerful army, burned all the towns and villages in his way, maſſacred all the Jews he could find, and purſued thoſe that eſcaped and that were in arms, almoſt as far as Jeruſalem. The Jews were thrown into ſuch conſternation, that they abandoned all the outer quarters of the city, and retired into the inner cincture near the temple. Ceſtius ſet fire to the former, and reſolving to beſiege the latter, took up his head-quarters in the royal palace. Inſtead of puſhing on the ſiege, it was ſhamefully raiſed by the advice of ſome generals of Ceſtius, whom Florus had corrupted ; ſo that the inſurgents, recovering their ſpirits, purſued him to Gideon, and defeated him with great ſlaughter. The Jews now deliberated concerning the beſt means of carrying on the war againſt the Romans, and appointed ſome of their braveſt chiefs to command the ſeveral cantons and fortreſſes of Judea. Joſephus, the writer of theſe wars, was appointed governor of the two Galilees ; Joſeph, the ſon of Gorion, and the high-prieſt Ananus, had the government of Jeruſalem ; and to Eleazar, the chief of the revolters, was aſſigned that of Idumæa. In the mean while there reigned ſuch diſſention among the Jews, that many of the better ſort, foreſeeing the bad effects of the reſentment of the Romans, forſook the city. The Chriſtians retired into Pella, a ſmall city on the other ſide of Jordan, in the tetrarchy of Herod, whither the war did not reach. When Nero received advice of the ſtate of affairs in Judea, he nominated Veſpaſian, who had ſignalized himſelf in Germany and Britain, to march with all ſpeed againſt Judea with a powerful army. He accordingly repaired to Syria, where he collected all his forces and thoſe of his auxiliaries, while his ſon Titus was ſent to fetch the fifth and tenth legions from Alexandria to Judea. Before their arrival, 10,000 of the Jews, who beſieged Aſcalon, were killed by Antony ; and on a ſecond attempt their loſs was doubled. In the beginning of the year 68, Veſpaſian, joined by Titus, entered Galilee, with a force of 60,000 well-diſciplined men ; and having burnt Gadara, advanced to beſiege Jotapa. Joſephus, governor of that province, having previouſly ſupplied the place with ſtores, defended it with great bravery 47 days ; but it was at length taken by aſſault, and the garriſon were put to the ſword. All the Jews were murdered or made priſoners. Forty thouſand are ſaid to have been ſlain, and Joſephus was among the priſoners. As ſoon as the news of the capture of Jotapa reached Jeruſalem, the Jews, who heard that Joſephus was among the ſlain, made great lamentations for the loſs of him for a whole month ; but when they were informed that he had ſurrendered himſelf a priſoner to the Romans, they began to conſider him as a baſe betrayer of their country ; and to perſecute him with the moſt irreconcileable hatred and diſdain. The Romans purſued their conqueſts ; and after the reduction of Tarichea and Tiberias, all the other cities of Galilee ſubmitted to the Romans, except Giſchala and Gamala, and the mountain of Itabyr. Theſe places were at length taken with great loſs to the Jews ; and the reduction of Giſchala having completed the conqueſt of Galilee, Titus rejoined his father at Cæſarea, where their troops had ſome reſpite before they undertook the ſiege of Jeruſalem. At this time the Jewiſh nation was divided into two very oppoſite parties ; one, which wiſhed to ſubmit to the Romans, and another, ſprung from the Gaulonitiſh incendiary, called the Zealots, which breathed nothing but war, confuſion, and cruelty. This latter party committed the moſt horrid acts of plunder and maſſacre ; and took poſſeſſion of Jeruſalem. After having butchered all perſons of any diſtinction or character, they began to wreak their rage on the common people who oppoſed them. This ſavage deſpotiſm obliged many of the Jews to forſake Jeruſalem and take ſhelter under the Romans, though they did it at the hazard of their lives, the gates and avenues of the city being ſo cloſely guarded that it was extremely dangerous to retire, and many who were caught in the attempt were immediately put to death. Veſpaſian remained at Cæſarea an inactive ſpectator of the diſmal condition of the Jewiſh nation. At length the Zealots themſelves divided into two factions ; the moſt profligate of them joined John of Giſchala, and others oppoſed him. During this anarchy, there aroſe in the country a new gang of Sicarii, who, having ſeized the ſtrong fortreſs of Maſſada, arranged themſelves under a bold adventurer, called Simon, and made this their place of retreat. Theſe plundered, burned, and maſſacred every where, and carried their booty into that place. Nero, about this time, A.D. 68, put an end to his life at Rome : and Veſpaſian was buſily employed in making preparations for the ſiege of Jeruſalem. In the mean while Simon, at the head of a great army, committed hoſtilities againſt the Zealots ; and having ſucceſsfully invaded Idumæa, poſted his army at the gates of Jeruſalem. Simon without, and John within, vied with each other in their crimes and cruelties. At length Simon was, by an act of treachery, admitted into the city, where he laboured to make his authority abſolute. Whilſt Judea was thus miſerably diſtracted with foreign and inteſtine wars, the Roman empire was in a ſtate of great confuſion. But as ſoon as Veſpaſian was choſen emperor, A.D. 69, he reſtored a calm to the empire. Joſephus, who had previouſly appriſed him of his advancement to the throne, began to reap the benefits of his anticipation. The emperor, recollecting his predictions, recompenſed his fidelity with many ſignal favours. As ſoon as Veſpaſian received intelligence that his election was confirmed at Rome, he left the beſt of his troops with his ſon Titus, with orders to beſiege Jeruſalem and to deſtroy it utterly ; and then he prepared for returning to the capital of his empire. The Jewiſh diſſentions in the mean while increaſed. Three factions ſubſiſted in Jeruſalem, which were inceſſantly contending with and weakening each other : till at length Titus, with four legions under his command, marched againſt the city in different directions. On his approach, the perſons who compoſed the three factions, ſeeing that they were beſieged by ſo powerful an army, under ſo brave a general, thought it neceſſary to unite in a vigorous defence againſt the common enemy. It was not long, however, before their union was diſſolved ; and one faction being deſtroyed, Simon and John ſometimes made united ſallies againſt the beſiegers, and at other times turned their arms againſt one another, as if they had pledged themſelves to make their ruin more eaſy to the Romans. The proceſs of the ſiege we ſhall not here minutely deſcribe ; ſome notice has already been taken of it under the article JERUSALEM ; and for a fuller account we refer to Joſephus (Bell. Jud. lib. vi. cap. 7.) The ſiege commenced in April, and laſted till the 8th of September, A. D. 70, when the city was taken and entered by Titus. According to Joſephus, the number of priſoners amounted to 97,000, beſides about 11,000, who were either ſtarved through neglect, or ſtarved themſelves through ſullenneſs and deſpair. Suetonius and Cornelius Nepos reckon but 600,000 ſlain and priſoners in the courſe of this war ; but they lived at a diſtance, and were leſs competent to give a juſt eſtimate of the number than Joſephus, who was a party and an eye-witneſs ; though he is thought to have exaggerated in compliment to Titus and the Romans. From the computation of Juſtus Lipſius, on the authority of Joſephus, the whole number of the Jews that periſhed in the ſeveral places through the kingdom, and elſewhere, from the beginning to the concluſion of the war, amounts to 1,354,490 perſons. Beſides theſe, a vaſt multitude died in the caves, woods, wilderneſſes, common ſewers, in baniſhment, and in many other ways, of whom no computation could be made; 10,000 were ſlain at Jotapa, not admited into the author's computation. Allowing for the priſoners and others that have been omitted, the whole amount will be above one million four hundred and ſixty thouſand. Simon and John, the two grand rebels and leaders of the principal factions, were reſerved for the triumph of Titus. Theſe two infamous perſons appeared at the head of 700 of the moſt beautiful Jewiſh captives who adorned this triumph. Simon was dragged through the ſtreets of Rome with a rope about his neck, ſeverely ſcourged, and put to death with ſome of his aſſociates; but John was ſent into perpetual impriſonment. The laſt fortreſs that was attacked and taken was Maſſada, the beſieged, under Eleazar, the grandſon of Judas the Gaulonite, having agreed to deſtroy one another; and thus this dreadful war terminated. Veſpaſian ordered the Jewiſh lands to be ſold for his own uſe; and all the Jews within the Roman empire were commanded to pay into his treaſury the uſual tribute of half a ſhekel, or two drachmas, which they had formerly been obliged to pay for the uſe of the ſanctuary. He likewiſe cauſed all the branches of the houſe of Judah to be cut off, to deprive them at once of all hopes of a deliverance, or future Meſſiah. Thus ended the Jewiſh nation and worſhip; nor have they been able to regain any ſettlement in their native country of Judea; but there is ſcarcely a country on the face of the globe where they are not to be found. They ſtill remain, as a monument of the truth of our religion, a diſtinct people, unincorporated among the inhabitants of the countries in which they reſide. They ſtill profeſs to pay a regard to the worſhip and ceremonies enjoined by the law of Moſes, to which they have added many rites that are merely of traditional authority. They alſo entertain the unfounded expectation of a Meſſiah to deliver them from the low ſtate into which they are ſunk. In many countries, and in different ages, they have been moſt cruelly maſſacred, and it is lamentable to think that they have been generally more mildly treated by Pagans and Mahometans than by Chriſtians. It would be endleſs to recite the numerous edicts that have been framed againſt them, and it would be painful to recount the inſtances of ſevere perſecution which their hiſtory furniſhes. And yet, notwithſtanding all the contempt and inſult, and ſuffering which they have endured, they ſtill ſubſiſt in almoſt every part of the globe. There are few countries from which they have not been repeatedly baniſhed, though they have availed themſelves of the opportunities for returning, which change of circumſtances has afforded them; and many of them have acquired both wealth and reputation, notwithſtanding the oppreſſion which they have endured. There is hardly any country in Europe in which the Jews have enjoyed greater liberty than in Poland. Here they have had their ſtately ſynagogues and academies; and their houſe of judgment, or court of judicature, was endowed with ſingular authority, being allowed to judge of criminal as well as civil caſes. Poland has been looked upon as a nurſery of learned rabbins, and the country to which the Jews have been formerly accuſtomed to ſend all their youths to ſtudy the Talmud, and the rites of their religion. The city of Hamburgh has been called the "Leſſer Jeruſalem," on account of the many Jews that live and traffic in it. The Jews have been endowed with great privileges at Prague. In Hungary they had in the 17th century the privilege of farming the revenue; till an edict of Ferdinand II. deprived them of it in 1630. Here they held their grand council, A.D. 1650, in which was debated the grand point, whether the Meſſiah was come? (See AGEDA.) In Holland they are ſaid by one of their writers to have enjoyed greater liberty and quietneſs, and to have been more flouriſhing and wealthy than in any other part of the world. We find nothing worth mentioning concerning the Jews in England till the time of king John; except that they were invited into this kingdom by William the Conqueror. Even ſo early as the reign of king Stephen, A.D. 1145, they were accuſed of crucifying a young Chriſtian in contempt of Chriſt and his religion, and were accordingly puniſhed for it; they were again proſecuted for the ſame atrocious fact at Glouceſter, in the reign of Henry II., A.D. 1160; and for a third, committed at St. Edmundſbury, A.D. 1181; but theſe tales were probably falſe accuſations alleged againſt them as apologies for oppreſſing and plundering them. The exactions impoſed by king John, A.D. 1210, fell with peculiar weight on the Jews, whom he cauſed to be impriſoned and tortured, becauſe they refuſed to pay the taxes which he impoſed upon them. At length he confiſcated all their effects and baniſhed them by a public edict. They were not treated in a much better manner under the long reign of Henry III., when many of them choſe to become Chriſtians, in order to avoid the ſeverity of his government; but being afterwards detected, they were puniſhed for their diſſimulation. The Jews of Norwich, A.D. 1235, were accuſed of having ſtolen a Chriſtian child, and of having kept him a whole year, in order to circumciſe and crucify him on the enſuing paſſover; but the fact being detected, they underwent a due puniſhment. Some other ſimilar facts have been mentioned, which at this diſtance of time, and conſidering the various means that were uſed for raiſing money, cannot be duly authenticated. The Holy war, to which Henry was preſſingly invited by the pope, A.D. 1252, proved another pretence for ſqueezing money out of his ſubjects, and eſpecially from the Jews, whom he made no ſcruple to ſtrip of all they had left. Another cauſe of demand was the Spaniſh war. After their expulſion by king Edward, A.D. 1291, they never more appeared in a body in this kingdom from that time, till they were recalled to it in the time of Oliver Cromwell. Rabbi Menaſſe, it is ſaid, came over into England A.D. 1656, with a deſign of procuring a ſettlement for the Jews, and was well received by Cromwell and the parliament; as was alſo his apology for the Jews, in which he exploded all the calumnies raiſed againſt his nation, eſpecially thoſe of their crucifying and uſing the blood of Chriſtian children at their paſſover: he is ſaid to have pleaded his cauſe ſo well, as to obtain a better ſettlement and greater privileges for them than they had before enjoyed in England.

Formerly in this country, as it is ſaid, the life of a Jew was at the diſpoſal of the chief lord where he lived, and alſo all his goods. So ſtrong were the popular prejudices againſt them, that in the year 1348 a fatal endemic diſtemper, which raged in a great part of Europe, was aſcribed to their having poiſoned the ſprings and wells; in conſequence of which, a million and a half of them were cruelly maſſacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. But we rejoice to think that we live in a more enlightened period, when a more liberal ſyſtem is eſtabliſhed. The countries of Europe, we truſt, are beginning to perceive the wiſdom and benefits of univerſal toleration. In England the Jews are allowed the free exerciſe of their religion, liberty of trade, and the quiet enjoyment of their property: though ſome acceſſion to their freedom is ſtill wanting. (See JEW's *Bill.*) Here, like thoſe of Holland, they are commonly diſtinguiſhed into German and Portugueſe, and have their reſpective ſynagogues, chiefs, ſchools, &c. but no academy; ſo that they are obliged to ſend their youth to be educated in Germany, or at Amſterdam. The former are the moſt indigent, as well as the moſt zealous for their religion, and moſt careful to inſtruct their children in it, and in the knowledge of the Hebrew tongue; whereas the latter, being opulent, are more remiſs in theſe reſpects; inſomuch that many of them cannot ſo much as underſtand the liturgy of their ſynagogues, but have it tranſlated into Portugueſe. However, both of them have had ſome learned rabbis. The rich among them are very generous and charitable, not only to their own poor, but to thoſe of the Chriſtians. Attempts are now (1811) making for communicating inſtruction to their poor, and for converting them to Chriſtianity. In France they have lately obtained a very conſiderable extenſion and eſtabliſhment of their privileges; an act of political wiſdom which in due time will, without doubt, be imitated by other ſtates; ſo that Jews will not only be merely tolerated in other countries, which is now the caſe in ſeveral countries of Europe, but obtain a permanent ſettlement. Anc. Univ. Hiſt. vols. ii and iii. Mod. Univ. Hiſt. vol. xi.

JEWS, are thoſe who profeſs obedience to the laws and religion of Moſes. See JUDAISM.

By ſtat. 1 Ann. c. 30. if Jewiſh parents refuſe to allow their Proteſtant children a fitting maintenance, ſuitable to the fortune of the parent, the lord chancellor, on complaint, may make ſuch an order as he ſhall ſee proper.

JEZDIKAN, or JEZDKAN, in *Geography*, a town of Perſia, in Adirbeitzan; 90 miles W. of Tabris.

JEZDKAST, or YEDKAS, a town of Perſia, in Farſiſtan; 42 miles S. of Iſpahan.

JEZIDES, or JEZIDEANS, a term uſed among the Mahometans, to ſignify *heretics*.

In which ſenſe *Jezidean* ſtands oppoſed to *Muſſulman*. Leunclavius tells us, that the name is derived from an emir, called *Jezid*, who killed the two ſons of Ali, Haſan and Huſſein, two grandſons of Mahomet on their mother's ſide, and perſecuted the poſterity of the prophet. The Agarenians, whoſe emir or prince he was, looked on him as an impious and heretical perſon, and hence took occaſion to call all whom they accounted heretics, Jezideans.

Beauſobre conjectures, that the denomination of this ſect is derived from the name of Jeſus; but it ſeems rather to be borrowed from the Perſian *Jazid* or *Jezdan*, ſignifying the good God, in oppoſition to Arimanius, the evil principle; ſo that the term points out this ſect as the worſhippers of the good or true god. After all, this name may have been derived from the city *Jezd*.

Some authors mention the Jezides as a particular people, ſpeaking a language different both from the Turkiſh and Perſian, though ſomewhat akin to the laſt. They farther tell us, that there are two kinds of Jezides; the one *black*, the other *white*. The white have no ſlit in the boſom of their ſhirt, but barely an opening for the head to paſs through; a thing that they obſerve with a great deal of ſtrictneſs, in memory of a circle of gold and light, which they ſay fell from heaven upon the neck of their grand ſcheik, or chief of their ſect. The black Jezides are faquirs, or religious, and go arrayed in ſable garments.

The Turks and Jezides bear a ſtrong averſion to each other, and the greateſt affront one can put upon a Turk, is to call him a Jezidean. On the contrary, the Jezides love the Chriſtians; being perſuaded that Jezid, their chief, is Jeſus Chriſt; or rather, becauſe ſome of their traditions mention, that Jezid made an alliance with the Chriſtians againſt the Muſſulmen.

They drink wine, even to exceſs, when they can get it, and eat ſwine's fleſh. They never undergo circumciſion, excepting when they are forced to it by the Turks. Their ignorance is ſurpriſing; they have no books. Indeed they pretend to believe in the Goſpel, and in the ſacred books of the Jews; but they never read either one or other of them. They make vows, and go on pilgrimage; but have no moſques, temples, nor oratories, no feaſts, nor ceremonies; all their religious worſhip conſiſting in ſinging hymns to Jeſus Chriſt, the Virgin, Moſes, and Mahomet. When they pray, they look towards the eaſt, in imitation of the Chriſtians: whereas the Muſſulmen turn towards the ſouth. They believe the devil may poſſibly, one day, come into favour again with God; and that he is the executor of God's juſtice in the other world: for which reaſon, they make it a point of prudence not to ſpeak ill of him, leſt he ſhould revenge himſelf of them.

The black Jezides are reputed ſaints: and it is forbidden to weep at their death; inſtead whereof they make rejoicings: and yet, for the generality, they are no more than ſhepherds. They are not allowed to kill the animals they eat; that office belongs to the white Jezides. The Jezides go in companies like the Arabs; and are an unſettled, wandering tribe, who frequent the Gordian mountains, and the deſerts of Curdiſtan, a province of Perſia. They often change their habitations, and live in black tents made of goats' hair, and encompaſſed with large ruſhes and thorns interwoven. They diſpoſe their tents in a circle, placing their flocks in the middle. The buy their wives; the ſtated price whereof is two hundred crowns, be they better or worſe. They are allowed divorce, provided it be to become faquirs. It is a crime among them to ſhave their beard, though ever ſo little. They have ſome cuſtoms which intimate that they ſprung originally out of ſome ſect of Chriſtians: for inſtance, in their feaſts one of them preſents a cup full of wine to another, bidding him take the cup of the blood of Jeſus Chriſt; which laſt kiſſes the hand of him who preſents it, and drinks.

JEZIERNICA, in *Geography*, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S.W. of Novogrodek.

JEZIOROCZE, a town of Lithuania, in the palatinate of Wilna; 32 miles W.N.W. of Braſlaw.

JEZORA, a town of Lithuania, in the palatinate of Troki; 12 miles N.E. of Grodno.

JEZREEL, in *Scripture Geography*. See ESDRAELON.

IF, in *Geography*, a ſmall, fortified, and garriſoned iſland in the Mediterranean, near the coaſt of France, at the entrance of the port of Marſeilles.

IFFEBAN, a town of Perſian Armenia; 138 miles E.N.E. of Erivan.

IFFROS, a town of Arabia, in the province of Yemen; 12 miles E S.E. of Täas.

IFLAMABAT, a town of Hindooſtan, in the country of Bengal; 124 miles S.S.E. of Dacca.

IFRAN, or UFARAM, a town and diſtrict of Africa, near the Atlantic, belonging to Morocco; 40 miles S.W. of Non.

IFVER KYLEE, a town of Sweden, in the province of Tavaſtland; 26 miles N.N.E. of Jamſio.

IGA, a ſea-port town of Japan, in the iſland of Niphon, and bay of Owari; 85 miles S.E. of Meaco. N. lat. 35° 10'. E. long. 138°.

IGARIPE, a river of Brazil, which runs into the Paraguay.

IGALSHA, one of the ſmaller Shetland iſlands, near the W. coaſt of Mainland. N. lat. 60° 57′. W. long. 1° 48′.

IGAT, a ſmall iſland in the Eaſt Indian ſea. S. lat. 7° 11′. E. long. 130° 35′.

IGEIALIN, a ſmall iſland in the ſtrait between Ruſſia and America. N. lat. 65° 40′. E. long. 189° 36′.

IGGON, a ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 60° 43′. E. long. 17° 7′.

IGILGILI, in *Ancient Geography*, a town of the eaſtern part of Mauritania Cæſarienſis, ſituated near the promontory which forms the bay of Saldæ, to the eaſt. It has been epiſcopal. See JIJEL.

IGILLIUM, now *Giglio*, an iſland of Italy, in the vicinity of that of Dianium, towards Etruria. The thick woods of this iſland ſerved as a place of refuge for a great number of Romans, who fled from the ſack of Rome by Alaric.

IGLAU, in *Geography*, a town of Moravia, capital of a circle of the ſame name, which contains 21 towns, 294 villages, and 6433 houſes. The town is well built, fortified, and populous; and contains 1196 houſes, two convents, and a village. The cloth manufactured in this town is good, and is conveyed to Italy by Trieſte. The town has alſo conſiderable commerce in corn and hemp; 62 miles S.E. of Prague. N. lat. 49° 25′. E. long. 15° 30′.—Alſo, a river of Moravia, which runs into the Teya near Muſchau.

IGLORSOIT, a town of Eaſt Greenland. N. lat. 61° 25′. W. long. 45° 10′.

IGNATEVSKOE, a town of Ruſſia, in the government of Ekaterinoſlav; 40 miles S. of Bachmut.

IGNATIA, in *Botany*, ſo named in the *Supplementum* of Linnæus, becauſe the ſeeds are known in the *Materia Medica* by the name of *Faba Sancti Ignatii*, or St. Ignatius's Beans. Linn. Suppl. 20. Schreb. 135. Willd. Sp. Pl. v. 1. 1053. Mart. Mill. Dict. v. 2. Gærtn. t. 179. Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Apocineæ*, Juſſ. Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſhort, bell-ſhaped, with five upright, ovate, blunt teeth. *Cor.* of one petal, funnel-ſhaped; tube thread-ſhaped, a ſpan long, ſmooth, erect; limb flat, in five deep, oblong, obtuſe, entire ſegments. *Stam.* Filaments five, inſerted into the receptacle, as long as the tube, thread-ſhaped, very ſmooth; anthers cohering in the form of an oblong, acute, hiſpid, five-ſided tube. *Piſt.* Germen minute, ſuperior, ovate, ſmooth; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma in two deep awl-ſhaped diviſions. *Peric.* Berry large, pear-ſhaped, ſmooth, of one cell, with a thick woody coat. *Seeds* numerous, ſmooth, crowded, hard, oblong, ſomewhat angular; the plumula ſtalked.

Eſſ. Ch. Calyx inferior, five-toothed. Corolla with a very long tube. Berry coated, of one cell, with many ſeeds.

1. I. *amara*. Linn. Suppl. 149. (Ignatiana philippina; Lour. Cochinch. 126.)—Native of the Eaſt Indies.—A *tree*, with long, twining, copious, ſmooth branches. *Leaves* oppoſite, ſtalked, ovate, entire, a ſpan long, very ſmooth. *Panicles* axillary, ſmall. *Flowers* very long, drooping, white, ſcented like jaſmine. *Fruit* the ſize and ſhape of a middling pear. *Seeds* ſcarcely an inch long, very bitter, celebrated as a cure for weakneſs in the ſtomach, and for intermitting fevers.

Juſſieu refers this plant to the genus *Strychnos*, but Gærtner points out the ſtalked cotyledons (or plumula), as almoſt peculiar to it, and not found in that genus.

IGNATIUS, in *Biography*, one of the apoſtolical fathers, was biſhop of Antioch, in Syria, towards the latter part of the firſt and the beginning of the ſecond century. According to Euſebius and St. Jerom, he ſucceeded Euodius in the ſee of Euodius, having been ordained, ſays the former, in the year 69, after the death of Peter and Paul at Rome, or, as others ſay, by Peter; and hence we may conclude, that he was acquainted with ſeveral of the apoſtles. Indeed, St. Chryſoſtom ſays, that he converſed familiarly with them, and was perfectly acquainted with their doctrine. This venerable man was condemned, in the perſecution of Trajan, to be devoured by wild beaſts in the public theatre at Rome, whither he was brought from Syria by the emperor's order for this purpoſe. The time of his martyrdom has been placed by Euſebius, and after him by Dupin, Tillemont, Cave, and Lardner, in the 10th year of Trajan, A. D. 107; but by Pearſon, Loyd, Pagi, Le Clerc, and Fabricius, in 116: the former, however, is thought to be the moſt probable opinion concerning the time of his death. Euſebius and Jerom mention ſeven epiſtles written by this father, and beſides theſe, other epiſtles have been aſcribed to him which are univerſally ſuppoſed by learned men to be ſpurious. Of the above-mentioned ſeven, there are two editions; one called the larger, and oftentimes the interpolated; and another, called the ſmaller. It is now, ſays Lardner, the general opinion of learned men, that the larger are interpolated, and that the ſmaller have by far the beſt title to the name of Ignatius. The larger, ſays this judicious writer, who compared the two editions, are an interpolation of the ſmaller, and not the ſmaller an epitome or abridgment of the larger. But whether the ſmaller themſelves are the genuine writings of Ignatius, biſhop of Antioch, is a queſtion that has been much diſputed among the ableſt critics. Upon duly conſidering the teſtimonies alleged from Iræneus, Origen, and Euſebius, and alſo the internal characters of ſimplicity and piety, which occur in theſe epiſtles, (*viz.* the ſmaller), Dr. Lardner concludes it to be probable, that they are for the main the genuine epiſtles of Ignatius. As to the time in which they were written, this is determined by that of his martyrdom. For they were written after he was condemned to the wild beaſts, and whilſt he was conducted as a priſoner from Antioch to Rome. Theſe epiſtles are now extant in Greek, and in an ancient Latin verſion, which latter was publiſhed by archbiſhop Uſher in 1664. In 1646, Iſaac Voſſius publiſhed ſix of the ſeven epiſtles in Greek, from a MS. at Florence: the epiſtle to the Romans, which was wanting, has been ſince publiſhed in Greek by Ruinart, from a MS. at Paris. In Ignatius's epiſtles there are frequent alluſions and references to particular books, or texts, of the New Teſtament; and it has been obſerved by ſome learned men, that this ancient writer has made mention of the ſcriptures of the New Teſtament under ſome general names and diviſions. Lardner's Works, vol. ii.

Ignatius is ſaid by Socrates, the eccleſiaſtical hiſtorian, lib. vi. cap. 8. "to have eſtabliſhed antiphonal ſinging at Antioch, from a viſion, in which he ſaw the bleſſed ſpirits above ſinging hymns to the ſacred Trinity, alternately; which method of ſinging," ſays the ſame author, "Ignatius taught to the church; and this, together with the account of the miracle which gave riſe to it, was communicated to all the churches of the Eaſt."

Nicephorus, St. Chryſoſtom, Anaſtaſius, and many others, acquieſce in this account of the origin of antiphonal ſinging, as do our countrymen Hooker, Hammond, Beveridge, and Dr. Comber.

IGNATIUS LOYOLA. See JESUITS.

IGNATIUS's *Bean*, *Faba Sancti Ignatii*, in the *Materia Medica*, the fruit of a plant growing in the Eaſt Indies and Philippine iſlands, deſcribed by father Camilli, in the Philoſophical Tranſactions, under the name of Catalongay, and Cantara; and by Plukenet, under that of Cucurbitifera malabathri foliis ſcandens, cujus nuclei faba ſancti Ignatii nuncupati. The Spaniards call it *cathalogon*. It is a dry and hard fruit, or kernel of a fruit, of the ſize of a large hazel nut; and is much celebrated for its medicinal virtues, being recommended in vertigoes, lethargies, epilepſies, aſthmas, quartan agues, and worms. It is alſo given againſt diſtemperatures of the ſtomach, and as an alexipharmic. The doſe in ſubſtance, as an emetic, is ten or twelve grains; and in ſmaller doſes it ſometimes promotes a plentiful ſweat: Neumann ſays that he has known intermitting fevers cured, by drinking, on the approach of a paroxyſm, an infuſion of ſome grains of the ſeed in carduus water; and Dr. Lewis has been informed, that two grains were found to have as much effect as a full doſe of bark. But it ſeems too hazardous for general uſe. See NUX *Vomica*, STRYCHNOS, and IGNATIA.

IGNAVUS, in *Natural Hiſtory*, a name given to the animal called in Engliſh the ſloth. See BRADYPUS and SLOTH.

IGNIARIUS LAPIS, a name given by ſome to the pyrites, or fire-ſtone, from its yielding a great quantity of ſparks when ſtruck againſt ſteel.

IGNICOLÆ, *Worſhippers of Fire*. See GABRES.

IGNIS AQUA, *Fire-Water*, a name by which Helmont, in ſome of his writings, calls the alkaheſt, or univerſal diſſolvent, ſo much talked of by him and Paracelſus.

IGNIS *Fatuus*, a common meteor, chiefly ſeen in dark nights frequenting meadows, marſhes, and other moiſt places, and often ſeen in burying-grounds, and near dunghills. It is known among the people by the appellations *Will with a Wiſp*, and *Jack with a Lanthorn*.

Sir Iſaac Newton calls it a vapour ſhining without heat; and it has been ſuppoſed to be of the ſame nature with the light iſſuing from putreſcent ſubſtances. Willughby and Ray were of opinion that it is occaſioned by ſhining inſects: but all the appearances of it obſerved by Dr. Derham, Beccaria, and others, ſufficiently evince, that it muſt be an ignited vapour. The form and ſize of the ignes fatui are very various and often variable. The late experiments on air ſerve to furniſh a rational explication of this phenomenon, to which the ignorant and ſuperſtitious have aſcribed ſo many alarming purpoſes. Inflammable air has been found to be the moſt common of all the factitious airs in nature; and to be the uſual product of the putrefaction and decompoſition of vegetable ſubſtances in water: and ſignior Volta, in a letter to Dr. Prieſtley, informs him that he fires inflammable air by the electric ſpark, even when the electricity is very moderate: and he ſuppoſes, that this experiment explains the inflammation of the ignes fatui, provided they conſiſt of inflammable air iſſuing from marſhy ground by the help of the electricity of fogs, and by falling ſtars, which are very probably thought to have an electrical origin. (Prieſtley's Obſ. on Air, vol. iii. Appendix, p. 382.) The reader will find a particular account of various particulars relating to the ignis fatuus, in the Phil. Tranſ. Abr. vol. vii. p. 147, &c.

Dr. Shaw deſcribes an ignis fatuus, which he ſaw in the Holy Land, that was ſometimes globular, or in the form of the flame of a candle; and immediately afterwards ſpread itſelf ſo much as to involve the whole company in a pale inoffenſive light, and then contract itſelf again, and ſuddenly diſappear. But in leſs than a minute it would become viſible as before; or, running along from one place to another, with a ſwift progreſſive motion, would expand itſelf, at certain intervals, over more than two or three acres of the adjacent mountains. The atmoſphere at this time had been thick and hazy, and the dew on their bridles was unuſually clammy and unctuous.

In the ſame weather, he obſerved thoſe luminous appearances, which, at ſea, ſkip about the maſts and yards of ſhips, and which the ſailors call *corpuſanſe* by a corruption of the Spaniſh *cuerpo ſanto*. Shaw's Travels, p. 393.

IGNIS *Gehennæ*, in *Chemiſtry*, a name given by Paracelſus to a certain menſtruum, capable of diſſolving all bodies, and remaining itſelf unaltered by them.

Van Helmont ſeems to make this the ſame with the alkaheſt, ſo celebrated in his writings, and ſo ardently ſought after by all the chemiſts ſince his time.

IGNIS *Judicii*. See JUDICIUM *Dei*, and ORDEAL.

IGNIS *Sacer*, literally *holy fire*, in *Medicine*, an appellation which has been given, from ancient times, to various diſeaſes, of which external redneſs and heat, followed by ulceration or gangrene, ſeem to have been the principal characteriſtics.

Other appellations have been uſed as nearly ſynonymous with this; ſuch as *ignis Sancti Antonii*, *ſeu St. Antoine*, or *St. Anthony's fire*, *morbus ardentium*, or *mal des ardens*, &c. By different writers, however, theſe terms have been applied to diſeaſes of conſiderable difference of character, by which much confuſion has been produced. We have already ſtated that the word *ſacer*, or ſacred, was employed to denote any thing *great*; and was uſed as an epithet to diſeaſes of uncommon ſeverity and duration, which, as Aretæus obſerves, ſeem to require more than human power to cure them (ſee EPILEPSY), and were often conſidered as inflictions of the divine vengeance. The name of St. Anthony ſeems to have been firſt aſſociated with an epidemic and fatal diſeaſe, which prevailed in many parts of France, and eſpecially in Dauphiné, about the end of the 12th century, when the religious houſes of the order of St. Anthony were uſed as hoſpitals for thoſe who were attacked with the diſeaſe. (Mezeray, Abrégé Chronologique.) It was the popular opinion in France, in the 12th and 13th centuries, that all the patients, who were conveyed to the abbey of St. Anthony, which had been recently founded at Vienne, in the province juſt mentioned, where the bones of this ſaint had been depoſited, were cured in the ſpace of ſeven or nine days. It is ſtated (in the "Hiſtoire des Ordres Monaſtiques," tom. i. p. 337.) that in 1702, there were ſtill ſome black and withered limbs which had been preſerved in that abbey from the period alluded to. Similar maladies were epidemic both at an earlier and later period: and it appears from a memoir by M. Le Comté, phyſician to the abbey at Vienne, that the ſame diſeaſe prevailed in Dauphiné in 1709. This phyſician affirms that the diſeaſe might be cured by judicious medical treatment; but that the moſt certain relief was obtained by addreſſing a vow to St. Anthony. See a full and able hiſtory of the ſubject in the "Memoires de la Societé Royale de Médécine de Paris," tom. i. p. 260. by M. M. de Juſſieu, Paulet, Saillant, and the abbé Teſſier, who were nominated by the ſociety to inveſtigate it.

From this circumſtance, it would appear that the *eryſipelas*, which conſiſts of an inflammation of the ſkin, accompanied by the riſing of large bliſters, analogous to thoſe produced by the action of fire, whether in burning or ſcalding, has obtained in this country the appellation of *St. Anthony's Fire*. It is not, however, the diſeaſe above alluded to as formerly epidemic in France.

The Latins underſtood by the term *ignis ſacer* the eryſipelas of the Greeks, as well as the *zona*, or *Herpes zoſter*, which we call *ſhingles*. See Celſus, De Med. lib. v. cap. 28, who places the diſeaſe among the *mala ulcera*, and mentions two ſpecies, one of which is apparently the *zoſter*.—Alſo, Marcellus, de Medicamentis, cap. xx.—Plin. Nat. Hiſt. lib. xxvi. cap. 2. See HERPES.

It would appear, that the confuſion among modern writers above mentioned, has ariſen from the application of the terms ignis ſacer, feu ſacré, feu St. Antoine, and mal des ardens, to *three* varieties of diſeaſe, eſſentially diſtinct from each other, excluſive of the eryſipelas: theſe are the common plague, the dry gangrene, or *ergot*, and the *raphania*. The two firſt, it appears, were prevalent about the ſame periods, in the tenth, eleventh, and twelfth centuries, affecting chiefly the lower claſſes of the people; whence hiſtorians have confounded the ſymptoms of the two maladies. But from the inveſtigation of M. M. Juſſieu, &c. it is obvious that the diſeaſe, more particularly deſignated by the title of "mal des ardens," was an *acute* peſtilential fever, attended with extreme heat, and with buboes in the groin, *i. e.* the *peſtis inguinaria*, or *inguinalis*, or, in the words of Mezeray, *peſte qui prenoit en l'aine;* which was alſo "the plague" deſcribed by Ambroſe Paré, Boccacio, Guy de Chauliac, Vinarius, &c. in the 14th century. This was likewiſe the opinion of Aſtruc. But the ſecond, *ignis ſacer*, or feu St. Antoine, was, in fact, a *chronic* diſeaſe, of conſiderable duration, accompanied by ſevere pain, and terminating in a ſhrivelling and drying of one or more of the limbs, which became black, and ultimately dropped off, if the life of the patient ſurvived.

In the *mal des ardens*, or plague, no drying or dropping off of the limbs occurred; and in the *feu ſacré* no inguinal buboes, or acute fever. In ſhort, the latter was obviouſly the diſeaſe which was ſubſequently denominated *ergot*, and has been attributed, by the majority of writers on the ſubject, to the uſe of rye as aliment, which was affected with the diſeaſe ſo named, to which that grain is liable. (See ERGOT in *Agriculture* and *Medicine*.) Notwithſtanding what has been maintained by the majority of authors, as ſtated in the article juſt referred to, it ſeems probable that this diſeaſe, which has been alſo called the *dry gangrene*, originated rather from a ſtate of ſtarvation, or imperfect nutriment, than from the *ergoted* rye in particular. "For it occurred only after unfavourable ſeaſons, when dearth prevailed, and was augmented by wars; and it afflicted almoſt excluſively the labouring people, the peaſantry, and mendicants; who," as M. Gaſſoud obſerves, "in order to avoid actual famine, were compelled to live upon a ſort of bread made of the meal of acorns, of grape-ſtones, of the roots of fern, and other ſuch crude and unnutritious ſubſtances." Camerarius poſitively aſſerts, that this gangrene was obſerved in the extremities of perſons who had certainly not eaten any ergoted rye. (See Acad. Natur. Curioſ. Cent. iv. Obſ. 82.) It was probably to theſe dry and contracted limbs that the term *ſceletyrbe* was applied by Pliny and Galen, as well as to thoſe which occur in the laſt ſtages of ſcurvy, rather than to the ſpaſmodic contractions in St. Vitus's dance, or *Chorea Sti. Viti*, to which they have ſince been applied. (See CHOREA.) Theſe contractions occurred among the Roman ſoldiers in Germany, and were attributed to the uſe of water from a particular ſpring (ſee Pliny Nat. Hiſt. lib. xxv. c. 3.); but more probably originated from imperfect nutriment.

A third diſeaſe, which has been ſeveral times epidemic in Germany and Sweden, and ſeems to differ materially both from the common plague and from the dry gangrene, has been attributed by ſome to the *ergot* of rye, and confounded, under the title of *ignis ſacer*, and *ergot*, with the dry gangrene. This is a febrile diſeaſe, which is ſaid to begin with an intenſe heat, accompanied with a ſenſe of *formication*, or of the creeping of inſects over the ſkin, which is followed by acute pains in the limbs, and convulſive contractions of the muſcles. This diſeaſe is ſaid to attack in ſucceſſive paroxyſms, after ſeveral of which it terminates by a violent ſweating, or diarrhœa. If it continued long, it degenerated into epilepſy or palſy. The ſweating ſickneſs of England, and the morbus Hungaricus, ſeem to have partaken of the nature of this fever; and to have originated, like it, in the uſe of corrupted and imperfect aliment, when every unfavourable ſeaſon produced a famine. Many writers, however, were perſuaded that it originated from the *ergot* of rye; while others attributed it to the *honey-dew* and *blight*, *uſtilago*, with which the corn and herbs were affected. The malady was epidemic in Sweden in 1746 and 1754, when it was obſerved that the *raphanus raphaniſtrum* grew in great abundance among barley; and Linnæus, ſuſpecting this to be the cauſe of the diſeaſe, fed ſome fowls with the ſeeds, which were ſaid to become convulſed; whence he gave the name of *Raphania* to the diſeaſe, which was adopted by Dr. Cullen. (Lin. Amœnit. Acad. vol. v. Cullen Noſol. Method. Gen. li.) It was called *Morbus convulſivus epidemicus* by the Marpurg profeſſors, and from the ſenſe of formication, was popularly termed, in Germany, *die kriebel krankheit*. (See Gregor. Horſt. Opera, tom. ii. lib. viii. Obſ. 22. Cullen Noſol. with the numerous references there given; and particularly the paper of M. Saillant, in the Mem. de la Soc. Roy. de Med. tom. i. p. 303; likewiſe the genera of Eclampſia, ſp. 1. *typhodes*, and Convulſio, ſp. 8. *ab uſtilagine*, in the Noſology of Sauvages.) It may, perhaps, be again queſtioned, however, whether, in theſe experiments of Linnæus, and in thoſe of the abbé Teſſier before mentioned (ſee ERGOT), the animals fed with the ſeeds of the raphaniſtrum and ergoted rye were not rather ſtarved, for want of nutritious food, than poiſoned by that which was deleterious. Is it probable that the rye, through extenſive provinces, ſhould be all affected with the ergot, ſo as to produce a general epidemic? Is not the diſappearance of the diſeaſe in our own times rather to be attributed to the general improvements in agriculture, which have rendered dearth leſs frequent and extenſive, and to the increaſe of commerce, which has facilitated the ſupplies of nutritious food, to make up for theſe partial deficiencies, than to the diſappearance of the diſeaſes of corn? See RAPHANIA.

IGNIS, *St. Antonii*. See ERYSIPELAS.

IGNISPICIUM, among the *Romans*, a ſpecies of divination taken from the fire uſed in ſacrifices. See PYROMANCY.

IGNITION, in *Chemiſtry*, the application of fire to metals, till ſuch time as they become red-hot without melting. This happens in gold and ſilver; but eſpecially in iron; but lead and tin are too ſoft and fuſible to bear ignition.

IGNORAMUS, q. d. *We do not know;* in *Law*, a word uſed by the grand jury, impannelled on the inquiſition of cauſes criminal, and formerly written upon the bill, when they diſlike their evidence, as defective, or too weak to make good the preſentment. But now they aſſert in Engliſh, more abſolutely, "not a true bill," or, which is the better way, "not found."

The effect of which is, that all farther inquiry upon that party for that fault is thereby ſtopped, and he is delivered without farther anſwer. See BILLA VERA.

IGNORANCE, the privation, or want of knowledge.

Ignorance, according to Mr. Locke, is chiefly owing to three cauſes: want of ideas; want of a diſcoverable connection between the ideas we have; and want of tracing and examining our ideas. See IDEA.

There are ſome things we are ignorant of for want of ideas: all the ſimple ideas we have are confined to the obſervation of our ſenſes, and the operations of our own minds, which we are conſcious of in ourſelves. What other ideas it is poſſible other creatures may have, by the aſſiſtance of other ſenſes or faculties, more or perfecter than we have, or different from our's, is not for us to determine; but to ſay there are no ſuch, becauſe we conceive nothing of them, is no better an argument, than if a blind man ſhould be poſitive there was no ſuch thing as light and colours, becauſe he had no manner of idea of any ſuch thing.—What faculties, therefore, other ſpecies of creatures have, to penetrate into the nature and inmoſt conſtitutions of things, we know not; this we know, and certainly find, that we want other views of them, beſides thoſe we have, to make diſcoveries of them more perfect. The intellectual and ſenſible worlds are in this perfectly alike; that the parts which we ſee of either of them, hold no proportion with that we ſee not; and whatſoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almoſt nothing, in compariſon of the reſt. Again, the want of ideas, which we yet ſeem capable of, is another great obſtacle in our way, and keeps us in ignorance of things, which we conceive capable of being known. Bulk, figure, and motion, we have ideas of; yet, not knowing what is the particular bulk, motion, and figure, of the greateſt part of the bodies of the univerſe, we are ignorant of the ſeveral powers, efficacies, and ways of operation, whereby the effects we daily ſee are produced. Theſe are hid from us in ſome things, by being too remote; and in others by being too minute.

This, at firſt ſight, ſhews us how diſproportionate our knowledge is to the whole extent even of material beings: to which if we add the conſideration of that infinite number of ſpirits that may be, and probably are, which are yet more remote from our knowledge, and whereof we have no cognizance at all; we ſhall find this cauſe of ignorance conceals from us, in an impenetrable obſcurity, almoſt the whole intellectual world; a greater, certainly a more beautiful world than the material: for, abating ſome very few ideas of ſpirits, which we get from our own mind by reflection, and from thence the beſt we can collect of the Father of all ſpirits, the author of them, and us, and all things, we have no certain information ſo much as of the exiſtence of other ſpirits, but by revelation: much leſs have we diſtinct ideas of their different natures, ſtates, powers, and ſeveral conſtitutions, wherein they agree or differ one from another, and from us: and therefore, in what concerns their different ſpecies and properties, we are under an abſolute ignorance.

Another cauſe of ignorance is, the want of diſcoverable connexion between thoſe ideas we have: where we want that, we are utterly incapable of univerſal and certain knowledge; and are, as in the former caſe, left only to obſervation and experiment. Thus the mechanical affections of bodies having no affinity at all with the ideas they produce in us, we can have no diſtinct knowledge of ſuch operations beyond our experience; and can reaſon no otherwiſe about them, than as the effects or appointments of an infinitely wiſe agent, which perfectly ſurpaſs our comprehenſion. The operation of our minds upon our bodies is as inconceivable: how any thought ſhould produce a motion in body, is as remote from the nature of our ideas, as how any body ſhould produce any thought in the mind. That it is ſo, if experience did not convince us, the conſideration of the things themſelves would never be able, in the leaſt, to diſcover to us. In ſome of our ideas there are certain relations, habitudes, and connections, ſo viſibly included in the nature of the ideas themſelves, that we cannot conceive them ſeparable from them by any power whatſoever: in theſe only we are capable of certain and univerſal knowledge. Thus the idea of a right-lined triangle neceſſarily carries with it an equality of its angles to two right ones; but the coherence and continuity of the parts of matter, the production of ſenſation in us, of colours and ſounds, &c. by impulſe and motion, being ſuch wherein we can diſcover no natural connection with any ideas we have, we cannot but aſcribe them to the arbitrary will and good pleaſure of the wiſe architect. The things that we obſerve conſtantly to proceed regularly, we may conclude, do act by a law ſet them; though by a law we know not, whereby thoſe cauſes work ſteadily, and effects conſtantly flow from them, yet their connections and dependencies being not diſcoverable in our ideas, we can have but an experimental knowledge of them. Several effects come every day within the notice of our ſenſes, of which we have ſo far ſenſitive knowledge; but the cauſes, manner, and certainty of their production, we muſt, for the foregoing reaſons, be content to be ignorant of. In theſe we can go no farther than particular experience informs us of matter of fact; and, by analogy, we gueſs what effects the like bodies are, upon other trials, likely to produce. But as to perfect ſcience and natural bodies (not to mention ſpiritual beings), we are ſo far from being capable of any ſuch thing, that it may be reckoned loſt labour to ſeek after it.

The third cauſe of ignorance is, our want of tracing thoſe ideas we have, or may have; and finding out thoſe intermediate ideas, which may ſhew us what habitude of agreement or diſagreement they may have one with another: and thus many are ignorant of mathematical truths for want of application in inquiring, examining, and by due ways comparing, thoſe ideas.

IGNORANCE, in *Law*, is a want of knowledge of the laws; which will not excuſe a perſon from ſuffering the penalty annexed to the breach of them; becauſe every one is obliged, at his peril, to know the laws of the land. "Ignorantia juris, quod quiſque tenetur ſcire, neminem excuſat," is as well the maxim of our own law, as it was of the Roman. (Plowd. 343. Ff. 22. 6. 9.) The ignorance or miſtake which conſtitutes a defect of will is, when a man, intending to do a lawful act, does that which is unlawful. For here the deed and the will acting ſeparately, there is not that conjunction between them which is neceſſary to form a criminal act. But this muſt be an ignorance or miſtake of fact, and not an error in point of law. Or if a man, intending to kill a thief or houſebreaker in his own houſe, by miſtake kills one of his own family, this is no criminal action (Cro. Car. 538.); but if a man thinks he has a right to kill a perſon excommunicated, or outlawed, wherever he meets him, and does ſo; this is wilful murder according to the principle above ſtated.

IGNOROMOUS, in *Geology*, is a term uſed by Mr. Kirwan (Geolog. Eſſays, p. 161. 274, &c.) to denote the ſubſtances thrown out of volcanos; and in which alſo he includes the materials of pſeudo-volcanic tracts, or thoſe which have been expoſed to accidental fires, like the burning of a ſeam of coals, &c.

IGRANI, in *Geography*, a town of European Turkey, in Dalmatia; 44 miles E.S.E. of Moſtar.

IGRIDI, a town of Aſiatic Turkey, in Caramania, ſituated on a large lake.

IGUALADA, a town of Spain, in Catalonia; 18 miles S.E. of Cervera.

IGUANA, in *Zoology*, the name of a ſpecies of lizard, very frequent in the Weſt Indies. It is an amphibious animal,

mal, of the lizard ſhape, and in colour partly brown and partly grey, in ſome of the animals; and in others of a beautiful green, variegated with black and white ſpots. From its neck to the extremity of its tail, it has a continued ſeries of flat-pointed and ſerrated ſcales, of a fine green colour. Theſe are largeſt at the neck. See Lacerta.

IGUAPE, in *Geography*, a river of Brazil, which runs into the Atlantic, S. lat. 3° 35'. W. long. 38° 56'.

IGUAY, a river of South America, which riſes in Paraguay, and croſſing Brazil, runs into the Atlantic, forming a large eſtuary at its mouth, where it is called "Rio Grande." S. lat. 31° 54'.

IGUEN, a river of Brazil, which runs into the Atlantic, S. lat. 10° 20'.

IGUIDI, a town and diſtrict of Africa, in the country of Sahara; the country is alſo called "Lempta."

IGUINAS, a ſmall iſland in the bay of Panama. N. lat. 7° 40'. W. long. 81° 8'.

IGUIRA, a town of Africa, on the Gold Coaſt, in the country of Soko, near which is dug very fine gold.

IGUITPO, a town of Brazil, in the government of St. Paul.

IGUNSKOI, a town of Ruſſia, near the eaſtern extremity of the continent of Aſia. N. lat. 65° 45'. E. long. 188° 34'.

IGUVIUM, now *Gavio*, in *Ancient Geography*, a town of Italy, in Umbria, ſituated towards the S.W. among the mountains. It was municipal, and at ſome diſtance from it was a temple of the Apennine Jupiter.

JHANSU-JEUNG, in *Geography*, a town, caſtle, and valley of Thibet. The town, if it may be ſo called, conſiſts of a monaſtery, ſituated on the concave ſide of a ſteep rock, and of about 150 houſes, which riſe in rows, one behind the other. They are ſquare, pretty regular in their form, and the whitened walls have a band about their tops, two or three feet broad, of a deep garnet colour, which, with the addition of temples, gilded ornaments, and the decorated dwellings of their ſuperior prieſts, make a very handſome and brilliant ſpectacle. The whole building was ſurrounded by high walls, which were continued along the ridge of the rock, and croſſed by many intermediate gateways or lodgements, ſo as to command the monaſtery, which fronted towards the caſtle, as well as to overlook the other ſide of the rock, which is extremely rugged, and almoſt perpendicular. The vicinity abounds with beggars of all ages and of both ſexes. The caſtle ſtands upon a rock, which, from its perpendicular height, and the irregularity of its cliffs, if not impregnable, muſt at leaſt be extremely difficult to be ſubdued by the aſſaults of any Tartar enemy. The valley of Jhanſu, which is very extenſive, has greatly the appearance of having been once the bed of a lake. It is particularly famous for the manufacture of woollen cloth, for which there is a very great demand. Theſe cloths, which are confined to two colours, garnet and white, ſeldom exceed half a yard in breadth; they are woven very thick and cloſe, like our frieze; they are very ſoft to the touch, for the fleece of their ſheep appears to be remarkably fine, and ſupplies an excellent material. Its ſuperior pliability and warmth induce almoſt all the prieſts, both here and in Bootan, to uſe it for the ſhort veſt which they wear next the ſkin; and thoſe who can afford it have alſo their winter mantle of the ſame. For this manufacture, the valley of Jhanſu, from its central poſition, is very conveniently ſituated, both as to receiving the material and conveying the cloth, when manufactured, to Teſhoo Loomboo, Laſſa, and Bootan. It has, in conſequence, become the principal ſettlement of manufacturers; and it certainly poſſeſſes every natural and eſſential advantage of ſpace, climate, and fertility. It is extremely rich with abundant crops of corn, and exceedingly populous; 130 miles W.S.W of Laſſa. N. lat. 28° 49'. E. long. 89° 32'. Turner's Thibet, p. 227.

IHLE, a river of Brandenburg, which, by the addition of an artificial canal, forms a communication between the Havel, 9 miles W. of Brandenburg, and the Elbe.

IHNE, a river, which riſes from a lake in the New Mark of Brandenburg, paſſes by Stargard, Golnow, &c. and runs into the Dammiſch ſee or Oder, 9 miles below Damme.

JHONSEN, Robert, in *Biography*, an eccleſiaſtic, and a learned muſician, was one of the firſt of our church compoſers who diſpoſed his ſeveral parts with intelligence and deſign. In writing upon a plain-ſong moving in ſlow notes of equal value, which was ſo much practiſed in theſe times, he diſcovers conſiderable art and ingenuity in the manner of treating ſubjects of fugue and imitation; in which kind of writing he ſeems to have been much ſuperior to Taverner.

IHRE, John, public profeſſor of rhetoric and politics in the univerſity of Upſal, was born in March 1707. He was, on account of the early death of his father, chiefly educated under his grandfather, then archbiſhop of Upſal. In 1730, when he had completed his ſtudies, he ſet out on his travels to enlarge his literary acquirements, and improve himſelf by the company and converſation of learned men. In 1733 he returned to Upſal, where he diſputed "De Uſu Accentuum Hebræorum," and was elected a member of the Academy of Sciences. In 1737 he was made public profeſſor of poetry, and in 1748 he was appointed by the king profeſſor of rhetoric and politics; an office, the duties of which he diſcharged for 40 years with great reputation, and with much real benefit to his pupils. In the year 1756 king Adolphus Frederick raiſed him to the rank of a counſellor of the chancery; two years after to that of patrician; and in 1759 conferred on him the order of the Polar Star. He died in 1780 in the 74th year of his age. He was author of many works, which will be laſting monuments of his great learning and indefatigable induſtry. In the year 1756 he undertook a Sueco-Gothic Lexicon, and began to arrange the materials which he had been preparing for the purpoſe. In 1766 he publiſhed a "Lexicon Dialectorum," in which he explained and illuſtrated obſolete words, ſtill uſed in the provinces; and in 1769 his "Gloſſarium Sueco-Gothicum" was publiſhed in two volumes folio. Sweden is indebted to him for many other works, particularly for an explanation of the old catalogue of the Sueco-Gothic kings, to which are added the Old Weſt-Gothic Laws. In his diſſertations "De Runorum Antiquitate, Patria, Origine, et Occaſu" he aſſerts that the Runic writing was formerly uſed in the greater part of Europe, was introduced into Sweden about the ſixth century, and became entirely extinct in the beginning of the 15th. He was poſſeſſed of a ſound judgment and a retentive memory; and ſo clearly were his ideas arranged, that he had never any need to correct what he had compoſed. He was of a mild diſpoſition, loved innocent mirth, had an open friendly heart, and entertained the utmoſt reverence for the Supreme Being.

JHYLUM, in *Geography*, a town of Hindooſtan, in Lahore; 73 miles N.N.W. of Lahore.

Jhylum *River*. See Behut.

JIB, in a *Ship*, is the fore-moſt ſail of it, being a large ſtay-ſail extended from the outer end of the bowſprit, prolonged by the jib-boom, towards the fore-top-maſt head.

Jib-*Boom* is a boom run out from the extremity of the bow-ſprit, parallel to its length, and ſerving to extend the bottom of the jib, and the ſtay of the fore-top-gallant-maſt. It is attached to the bowſprit by means of two large boom-irons, or by one boom-iron, a cap on the outer end of the bow-ſprit; or by the cap without, and a ſtrong laſhing within.

JIBBEL-Auress, in *Geography*. See Auress.

Jibbel-*Decra*, a mountain of Algiers, in the province of Titterie; 50 miles S.S.E. of Algiers.

Jibbel-*Karkar*, a range of rocky mountains in the weſtern province of Algiers; 20 miles N.E. of Tremecen.

Jibbel-*Dwee*, a mountain of Africa, in the weſtern province of Algiers; S. of El Khadarah.

Jibbel-*Iſkell*, a mountain of Africa, in the northern part of Tunis, anciently mount Cerna; about 15 miles S.W. of Bizerta.

Jibbel-*Muſtewah*, a mountain of Algiers, in the province of Conſtantina, the chief abode of a clan of Kabyles, called Welled-Abdenore; 45 miles S. of Conſtantina.

Jibbel-*Seilat*, a mountain of Africa, in the Sahara; 78 miles S S.E. of Algiers.

JIB-BELEAH, a range of mountains of Africa, forming a boundary between Tunis and Tripoli.

JIBING. See Gybing.

JIDDA, in *Geography*, a ſea-port town of Arabia Felix, in the ſherriffate of Mecca, ſituated on the Red ſea, and firſt ſurrounded with walls by Sultan El Guri in 1514, in order to protect it from the Portugueſe, who were then beginning to become formidable on the Red ſea. Although the walls are ſtill ſtanding, and alſo the bridges, they are now in a ruinous ſtate. The palace of the Pacha is but an indifferent building; but there are other fine buildings in the town, conſtructed of coral ſtone. The other houſes are ſlight wooden fabrics. As Jidda is entirely deſtitute of water, the inhabitants are ſupplied with that which is collected by the Arabs in reſervoirs among the hills, and brought by them from thence upon camels. The dreſs of perſons of diſtinction reſembles that of the Turks in Cairo; but the poorer ſort wear only a ſhirt without breeches. The dreſs of the women is that of the Arabian females in general; large drawers, a flowing ſhirt, and a veil. The employment of many of the poorer ſort is fiſhing, from which they earn but a ſcanty ſubſiſtence. The country round Jidda is ſandy and barren; and the ſea ſeems to have receded from the land here as well as in other places, as, at a certain diſtance from the ſhore there are hills compoſed of coral-rock, reſembling the banks of coral lying along the coaſt. The Arabs have a ſingular method of taking wild ducks in the harbour; the perſon who is in ſearch of the game ſtripping himſelf, and covering his head with ſea-weeds, and thus approaching the ducks, which, unalarmed at the ſight of the weeds, he ſeizes by the feet. As Jidda is part of the dominions of the ſherriffe of Mecca, the Turkiſh ſultan ſends a Pacha to this city; but the ſupreme authority is ſhared between the ſherriffe and the Turkiſh governor, who is annually changed. The revenue ariſing from the cuſtoms is divided between the ſultan and the ſherriffe. The dues of cuſtom are fixed at 10 per cent. upon the value of the goods, arbitrarily eſtimated, ſo that they may be really conſidered as equal to 12 or 15 per cent. The Engliſh, however, are particularly favoured, even more than the ſubjects of the ſultan; they pay only eight per cent. and are ſuffered to diſcharge this in goods, whereas all others muſt produce money. Although the trade of Jidda is conſiderable, this city is no more than a mart between Egypt and India. The ſhips from Suez ſeldom proceed farther than this port; and thoſe from India are not ſuffered to advance to Suez. The circumjacent country affords nothing but Taif almonds for objects of traffic; and of theſe the Engliſh carry 500,000 weight annually to India. Balm of Mecca is alſo brought hither from the neighbourhood of Medina, as an article for exportation. The imports are greater, becauſe both Mecca and Medina are to be ſupplied from this market. Large quantities of corn, rice, lentiles, ſugar, oil, &c. are imported from Eggpt, without which this part of Arabia could not poſſibly be inhabited. All goods from Europe come alſo by way of Egypt; and, on the other hand, thoſe which are brought hither from India, paſs generally into Egypt. No money is coined in this province; the ſpecie current here is altogether foreign, and the ſame as at Conſtantinople and Cairo. But the larger coins paſs at a higher rate here than at Cairo, becauſe ſmall money, brought by the pilgrims, is more plentiful here than even where it is coined. The trading janizaries in this place are properly merchants, who are protected by the privileges of that body in which they are enrolled from the impoſitions to which this traffic would otherwiſe be liable; but they perform no military duty, and receive no pay. N. lat. 21° 17′. Niebuhr. Bruce.

JIDGER, a river of Hindooſtan, probably the ſame with the Selima, which runs on the weſt of Sirhind to the ſouth, towards Soonam, about 60 miles S.W. of Sirhind; between which and the Setlege a canal was formed by Feroſe.

JIDMEELAH, a town of Algiers; 28 miles W.S.W. of Conſtantina.

JIDOON, a diſtrict of Aſia, ſituated on the E. ſide of the river Sindé, on the borders of Cachemire and Thibet.

JIG, in *Muſic*, implies both a dance and a tune, generally in rapid triplets of $\frac{6}{8}$, $\frac{9}{8}$, or $\frac{12}{8}$. See Giga.

JIGAT, or Juggat *Point*, in *Geography*, a cape of Hindooſtan, forming the weſtern extremity and fifth diviſion of Guzerat, on which point is a pagoda. N. lat. 22° 23′. E. long. 68° 12′.

JIGGER, in *Sea Language*, is a machine conſiſting of a piece of rope about five feet long, with a block at one end, and a ſheave at the other; and uſed to hold on the cable, when it is heaved into the ſhip by the revolution of the windlaſs. See Holding *on*.

Jigger-*tackle*, is a light ſmall tackle, conſiſting of a double and ſingle block, uſed on various occaſions by ſeamen.

JIGGUROON, in *Geography*, a town of Hindooſtan, in the circar of Sirhind; 23 miles W.S.W. of Sirhind.

JIGNI, a town of Hindooſtan, in the circar of Gohud; 18 miles S.S.E. of Kooch.

JIG-PIN, in *Mining*, is a pin of wood, which the drawers of ore or coals, &c. by ſtowſes or turn-beams, put into a hole, to prevent the handleſs turning round, when it is wiſhed to ſuſpend the barrel or corve in or over the ſhaft.

JIHON, in *Geography*. See Amu and Oxus.

JIJEL, a town of Algiers, in the province of Conſtantina, now reduced to a few houſes and a ſmall fort, in which the Turks have a ſmall garriſon: it is ſituated on a point of land near the ſea; 30 miles E.N.E. of Boujeiah. This was formerly called *Igilgili*, which ſee. N. lat. 36° 56′. E. long. 6°.

JILGOUN, a town of Aſiatic Turkey, in the province of Caramania; 28 miles E. of Akſerai.

JILLIFREE, a town of Africa, in the kingdom of Barra, on the banks of the Gambia. N. lat. 13° 16′. W. long. 16° 7′.

JIMMALI, a town of Abyſſinia; 40 miles S. of Miné.

JIMMEL, a town of Africa, in the kingdom of Tunis, anciently called "Tegæa;" 11 miles S.W. of Lempta.—Alſo, a town of Algiers, 33 miles S.W. of Conſtantina.

JIMMELAH, a town of Africa, anciently "Gemella," near which are magnificent ruins, the remains of an amphitheatre, &c.; 27 miles S.S.W. of Conſtantina.

JINBALA, or GUINBALA, a kingdom of Africa, being an iſland formed by two branches of the Niger, which ſeparate at leaving the lake Dibbie, and again unite about 15 miles from Tombuctoo. It is of an oval form, about 80 miles long, and about 40 in its greateſt breadth. The country is ſaid to be fertile, and abounding ſo much with ſwamps and creeks, that the Moors have not been able to ſubdue it. The inhabitants are negroes. Its capital is Jinbala, ſituated on one branch of the Niger, and ſerving as a reſting place for merchants, who trade between Tombuctoo and the weſtern parts of Africa. N. lat. 16° 4'. E. long. 0° 16'.

JINCUGHI, a town of Aſiatic Turkey, in Natolia; 18 miles N. of Kiutaja.

JINDEYA, a town of Africa, in the country of Woolly; 30 miles W.S.W. of Medina.

JINGLER, a town of Hindooſtan, in Oude; 33 miles S.E. of Gooracpour.

JINNETT, a ſea-port town of Algiers, in the province of Titterie, ſituated on a ſmall creek of the Mediterranean, at the mouth of the Yiſſer. Great quantities of corn are annually exported from this part to Europe; 33 miles E. of Algiers. N. lat. 36° 43'. E. long. 4° 10'.

JINZO, a town of Spain, in Galicia; 12 miles S.E. of Orenſe.

JINZOOWARAH, a town of Hindooſtan, in the country of Guzerat; 40 miles S. of Janagur.

IJO, a town of Sweden, in the government of Ulea; 20 miles N. of Ulea.—Alſo, a town of Japan, in the iſland of Xicoco. N. lat. 34°. E. long. 134° 10'.

JIONPOUR, a circar of Hindooſtan, in Allahabad, about 50 miles long and 30 broad.—Alſo, the capital, which is a ſmall city on the Goomty river; about 40 miles N.W. of Benares, and on the road from that city to Fyzabad. N. lat. 25° 46'. E. long. 82° 55'.

JIOSORRA, a town of Africa, in Bambarra. N. lat. 14° 38'. E. long. 3° 40'.

JIRBAN, a town of Arabia, in Yemen; 8 miles N.W. of Sana.

JIRREE, a town of Hindooſtan, in the circar of Gohud; 25 miles W. of Narwa.

JIRWARY, a town of Hindooſtan, in the circar of Gohud; 7 miles S.W. of Gwalior.

JITTIS, a town of Sweden, in the province of Tavaſtland; 62 miles E. of Tavaſthus.

JIVANI, a name of the Hindoo regent, or god of fire, correſponding in many points with the Vulcan of weſtern mythologiſts. Another of his names is *Pavaka*, which ſee.

JIYA, in *Zoology*, the name of an American animal, of the otter-kind, called alſo *carigucibeiu*. It is an amphibious creature, of the ſize of a middle-ſized dog. Its head is round, and like a cat's; but its noſe is ſomewhat pointed; its eyes are black; its ears roundiſh, and placed very low as in the otter; and it has a ſort of beard or whiſkers, compoſed of a few ſtiff hairs; the feet have all five toes, the inner one being ſmaller than any of the others: the hair is ſoft, not long, and all black, except thoſe on the head, which are brown, and ſome which compoſe a yellowiſh ſpot under the throat. Its note is much like that of a young puppy. It feeds on fiſh, and other animals. Ray.

IK, in *Geography*, a river of Ruſſia, which runs into the Kama.—Alſo, a river of Ruſſia, which runs into the Sakkara.

IKALIS, a town of Sweden, in the government of Abo; 40 miles E.N.E. of Biorneborg.

IKARUNGA, a town of Japan, in the iſland of Niphon; 75 miles N. of Meaco. N. lat. 36° 16'. E. long. 136°.

IKDER, a town of Aſiatic Turkey, in Natolia; 30 miles S. of Satalia.

IKEIKANI, a town of Aſiatic Turkey, in Natolia; 65 miles E. of Conſtantinople.

IKENDA, a town of Japan, in the iſland of Niphon; 140 miles W.N.W. of Jedo.

IKENILD STREET, one of the four famous ways that the Romans made in England. See WATLING-STREET.

IKLERA, in *Geography*, a town of Hindooſtan, in Katchwara; 34 miles E.N.E. of Saurungpour.

IKOLLA, a province of Africa, in the kingdom of Angola, E. of Loanda.

IKON, a town of Africa, on the Gold coaſt, where the Dutch have a factory.

IKTIMAN, a town of European Turkey, in Bulgaria; 25 miles E.S.E. of Sofia.

IKUA, a town of Japan, in the iſland of Ximo; 50 miles N.N.E. of Nangaſaki.

ILA, ILAY, *Iſla*, or *Iſlay*, is one of the Hebrides, lying to the ſouth-weſt of Jura, and in the county of Argyll, Scotland. It extends twenty-eight miles from north to ſouth, and eighteen from eaſt to weſt. On the eaſt ſide the ſurface is hilly, and covered with heath, but the greater part of the iſland is flat. The coaſt is rugged and rocky, but indented by numerous bays and harbours, which are ſafe landing-places for ſmall veſſels; and at Lochindale is a harbour for ſhips of conſiderable burthen, with a quay, oppoſite to the large village of Bowmore. There are ſeveral lakes; and the iſland is well watered by numerous ſtreams and rivers, abounding with trout and ſalmon. In the centre of the iſland is a lake called Loch Finlagan, three miles in circumference, with the iſlet of the ſame name in the middle, the ancient reſidence of the Macdonalds, the great lords of the iſles; but the palaces and offices are now in ruins. Inſtead of a throne, the chief ſtood on a ſtone ſeven feet ſquare, in which there was a hollow cut to receive his feet: here he was crowned and anointed, in preſence of his chieftains, by the biſhop of Argyll and ſeven inferior prieſts. The ſtone is ſtill preſerved. The ceremony, after the new lord had collected his kindred and vaſſals, was truly patriarchal. Having put on his armour, helmet, and ſword, he took an oath to rule as his anceſtors had done; to govern as a parent would his children: his people, in return, ſwore that they would render him the obedience due to a parent. Anciently, the dominions of this potentate included Iſla, Jura, Colonſay, Mull, Arran, &c.: and the peninſula of Kintyre uſually ſhared the fate of the iſles; for we find that, in 1093, after one of the grants of the kings of Scotland, the lord of the iſles, in order to bring Kintyre within the compaſs of the grant, had his barge drawn under ſail over the iſthmus of Tarbert; after which, conſidering his power, not even the Scottiſh monarch was ſo hardy as to deny that Kintyre was an iſland. About the year 1586, the dominion of the iſles conſiſted only of Iſla, Jura, Kintyre, and Knapdale; ſo reduced was it from its former extent during the reign of James III. Near Finlagan is another little iſle, called Ilan-na-corlle, *i. e.* the iſland of Council, where thirteen judges conſtantly ſat to decide differences between the ſubjects of the Macdonalds, for which they received the eleventh part of the value of the conteſted property.

In the firſt iſle were buried the wives and children of the lords of the iſles: but their own bodies were depoſited in the more ſacred ground of Iona. Beſides the caſtle on the iſland, theſe powerful lords had a houſe and chapel at Lagannon, on the ſide of Loch-in-dal; a ſtrong caſtle on a rock in the ſea, at Dunowaick, at the ſouth-eaſt end of the iſland; for, after their expulſion from the Iſle of Mann, in 1304, they made this iſland their place of reſidence; ſometimes making their abode at Dalreudhain in Kintyre, where the modern burgh of Campbeltown is ſituated. The iſland was formerly divided into four pariſhes, Kilchonan, Kildalton, Killarrow, and Kilmeny; but the two laſt are now united. The total population of the iſland, as ſtated in the ſtatiſtical reports of the three pariſhes in 1793, was 9500. The quadrupeds, enumerated by Mr. Pennant, beſides the domeſtic animals, are weaſels, otters, and hares; the latter dark-coloured, ſmall, and bad runners. The birds are eagles, peregrine falcons, muir-fowl, ptarmigans, and red-breaſted gooſeanders. Vipers ſwarm in the heath; and the natives are ſaid to cure the wound by a poultice of hemlock and henbane. In this iſland ſeveral ancient diverſions and ſuperſtitions are ſtill preſerved: the latter, however, are almoſt extinct, or only lurk among the very meaneſt of the people. Yet the power of faſcination ſtill retains a ſtrong hold on their minds. The late-wakes, or funerals, were attended with ſports and dramatic entertainments, compoſed of many parts; and the actors often changed their dreſſes ſuitable to their characters. The ſubject of the drama was hiſtorical, and preſerved by memory. The general language of the common people is the Gaelic; yet Engliſh is well underſtood, and taught in all the ſchools. The chief amuſements are ſinging and dancing; in the latter are exhibited an eaſe and gracefulneſs of motion peculiar to this iſland. Ila abounds with mines of lead and copper, which are very rich, and have been long wrought. There are alſo vaſt quantities of that ore of iron called bog-ore, of the concrete kind, and below it large ſtrata of vitriolic mundic. Near the veins of lead are found ſpecimens of barytes and excellent emery. A ſmall quantity of quickſilver has been found in the muirs, and it is probable that a more attentive ſearch would diſcover more of that valuable mineral. Limeſtone and marle are abundant; but of theſe the inhabitants are ſcarcely acquainted with the value. Pennant's Tour to the Hebrides.

Ila, in *Hindoo Mythology*, a female who appears in ſeveral undefined or equivocal characters. Sir William Jones notices her as the daughter of the ſeventh Menu, or Noah (ſee Menu), and wife of a ſon of Chandra, or the Moon. She is thus one of the maternal anceſtors of both the great claſſes of people diſtinguiſhed among the Hindoos by the titles of children of the ſun, Surya-vanſa (ſee Suryavansa), and children of the moon, Chandra-vanſa; Ila's father, Menu, being of the former race, and hence ſurnamed Vaivaſwata, or offspring of the ſun. (See Vaivaswata.) In another of her characters ſhe appears to be a perſonification of the earth, and the wife of Menu or Noah; in another as his ſon: in all of which may be traced ſome appearance of allegory referring to the important part borne by the great reſtorer of our ſpecies, as parent and protector of terreſtrial productions. On one occaſion ſhe incurred the diſpleaſure of Parvati, the Juno of the Hindoo Olympus, who curſing her, cauſed her to become alternately one month a man and a month a woman; but by the efficacy of devotions paid to a linga (ſee Linga), the ſymbol of Siva, ſhe was reſtored to her permanency of ſex through the favour, thus propitiated, of that divinity. This fable we ſhall not attempt to explain. See Moor's Hindoo Pantheon.

ILAK, or Jalak, in *Geography*, a town of Nubia, on the Nile, which ſome ſuppoſe to have been the ſcite of the ancient Meroe. N. lat. 17° 48′. E. long. 34° 10′.

ILAMBA, or Eluané, the name of two provinces of Africa, in the kingdom of Angola; the Upper is the more inland, and the Lower nearer the Atlantic. Both are fertile, and yield a conſiderable revenue to the crown of Portugal.

ILANTZ, the capital of the Grey league, a ſmall town of Switzerland, containing about 60 houſes, and partly ſurrounded by walls. It is the place where the general diet of the three leagues aſſembles every third year. The adjacent country is fertile in every ſpecies of grain and paſture. The points of view are extremely fine, exhibiting a ſmall plain ſkirted by cultivated mountains, and backed by a ridge of barren rocks which bound the valley of Lugnetz. N. lat. 46° 40′. E. long. 9° 18′.

ILANTZINSKOI, a town of Ruſſia, in the government of Irkutſk; 10 miles N.N.W. of Verchnei or Udinſk.

ILAT, a ſmall iſland on the eaſt coaſt of the iſland of Bouro. S. lat. 3° 35′. E. long. 127° 33′.

ILATHERA Bark. See Clutia.

ILBERG, in *Geography*, a town of Sweden, in the province of Warmeland; ſix miles N.W. of Carlſtadt.

ILCHESTER, properly Ivelchester, is an ancient borough, market-town, and pariſh in the hundred of Tintinhull, Somerſetſhire, England, and is ſituated on the river Ivel. Its Roman name was *Iſchalis*, and it was one of the moſt eminent ſtations the Romans poſſeſſed in theſe parts. It was by them environed with a ſtrong wall and deep ditch, which originally was filled with water from the river. Its form was an oblong ſquare, the Foſſe-road paſſing through it from north-eaſt to ſouth-weſt. The veſtiges both of the wall and ditch are ſtill diſcernible, the former being regularly compoſed of ſtone and brick-work intermingled: the ditch on the north-weſt ſide is now filled up, and become a road called Yard-lane. The Foſſe-road was here paved with large flag-ſtones; ſome of which are viſible in the old ford through the river near the bridge. At the time of the Norman conqueſt, Ivelcheſter was a city of conſiderable note, and contained ſeveral pariſh churches. Vaſt arches and immenſe foundations of ancient buildings lie beneath the ſurface of the ground; and the entire ſcite of the old city is filled with ſubterraneous ruins. The preſent town exhibits but ſmall indications of its former greatneſs. It conſiſts of four ſtreets but indifferently built; and has one pariſh church, and a meeting-houſe for Diſſenters. The church has a tower, fifty feet high, conſtructed of Roman ſtone. The aſſizes for the county were fixed to be held here by a patent granted by Edward III., but they have long ſince been held only alternately with Wells, Taunton, and Bridgewater. The county gaol is ſtill here. The civil government of this borough is veſted in a bailiff and twelve capital burgeſſes, who, together with the inhabitants not receiving alms, return two members to parliament. The firſt return was 26 Edward I. An hoſpital for the entertainment of pilgrims and poor travellers was founded, about the year 1226, by William Dacus: it was afterwards converted into a nunnery; the ruins are ſtill extant. A weekly market on Wedneſday has exiſted here ever ſince the conqueſt, but has greatly declined. Here are two annual fairs. Ilcheſter is 122 miles diſtant from London: the return under the population act of 1801 was 138 houſes, and 942 inhabitants. The celebrated philoſopher Roger Bacon, juſtly accounted the wonder of his age, was born in this town, A. D. 1214. Collinſon's Hiſtory of Somerſetſhire, vol. iii.

ILDINSKOI, a cape of Ruſſia, in the Pacific ocean, near the northern part of Kamtſchatka. N. lat. 59° 15′. E. long. 164° 14′.

ILDUM, in *Ancient Geography*, a town of Spain, belonging to the Ilercaones, at ſome diſtance from the ſea, N.E. of Segobriga. In Antonine's Itinerary it is marked on the route from Dertoſa to Saguntum.

ILERAY, in *Geography*, one of the ſmaller weſtern iſlands of Scotland, near the N. coaſt of Benbecula. N. lat. 57° 30′. W. long. 7° 25′.

ILERCAONES, in *Ancient Geography*, a people of Spain, in the Tarragonenſis, towards the mouth of the Ebrus.

ILERDA, or Lerida, a town of Spain, upon the Sicoris: its ſituation at the foot of the Pyrenees expoſed it inceſſantly to the horrors of war from the time when the Romans began to penetrate into Spain. Under Gallienus it was almoſt entirely deſtroyed by the Barbarians, who, migrating from Germany, ravaged the weſtern parts of the empire.

ILERGETES, a people of Hither Spain, E. of the Vaſcones. Their principal towns were Ilerda, Berguſia, and Oſca.

ILES, in *Agriculture*, a term provincially applied in ſome places to denote the beards or awns of different deſcriptions of grain, ſuch as barley, wheat, &c. See Awns.

ILETERTON, in *Geography*, a town of Thibet, 30 miles S.W. of Cha-tcheou.

ILEUM, in *Anatomy*, the third diviſion of the ſmall inteſtine. See Intestine.

ILEX, in *Botany*. Linn. Gen. n. 172. Reich. 184. Schreb. 232. Juſſ. 379. Mart. Mill. Dict. v. 2. Smith Fl. Brit. 192. Aquifolium, Tournef. 371. Claſs and order, *Tetrandria Tetragynia*. *Polygamia Dioecia*, Hudſ. Nat. Ord. *Dumoſæ. Rhamni*, Juſſ.

Gen. Ch. *Cal.* Perianth four-toothed, very ſmall, permanent. *Cor.* one-petalled, four-parted, wheel-ſhaped; *diviſions* roundiſh, ſpreading, rather large, with cohering claws. *Stam.* Filaments four, awl-ſhaped, ſhorter than the corolla, anthers ſmall. *Piſt.* Germen roundiſh; ſtyle none; ſtigmas four, obtuſe. *Peric.* Berry roundiſh, four-celled. *Seed* ſolitary, bony, oblong, obtuſe, gibboſe on one ſide, cornered on the other.

Eſſ. Ch. Calyx four-toothed. Corolla wheel-ſhaped. Style none. Berry four-ſeeded.

1. I. *aquifolium.* Common Holly. Linn. Spec. 181. Syſt. 168. Reich. 1. 354. Hort. Cliff. 40. Upſ. 22. Hudſ. Engl. 446. Wither. Ar. 168. Mill. fig. t. 46. Hunt. Evel. 262. Thunb. Jap. 79. Lour. Cochinch. 91. (Aquifolium, Hall.) Helv. n. 667. Ilex, Scop. Carn. n. 177. Varieties α. I. aculeata baccifera, Bauh. Pin. 425. Aquifolium vulgo, Bauh. Hiſt. 1. 114. Tourn. Inſt. 600. Aquifolium, Ger. 1155. Raii Hiſt. 1622. Syn. 466. β. I. heterophylla. Various leaved Holly. Ait. Hort. Kew. 1. 169. "Leaves toothed, ſpiny, and entire." γ. I. craſſifolia. Thick-leaved Holly. Ait. Hort. Kew. 1. 169. "Leaves thicker, equally ſerrate." δ. I. recurva. Slender Holly. Ait. Hort. Kew. 1. 169. "Leaves narrower, recurved." ε. I. ferox. Hedgehog Holly. Ait. Hort. Kew. 1. 169. Linn. Syſt. 168. β. Reich. 1. 354. β. "Leaves with the upper ſurface ſpiny."

2. I. *opaca.* Corolina Holly. Ait. Hort. Kew. 1. 169. "Leaves ovate, acute, ſpiny, ſmooth, flat, flowers ſcattered at the baſe of the laſt year's ſhoots." Native of Carolina: flowers in May and June.

3. I. *Perado.* Thick leaved ſmooth Holly. Ait. Hort. Kew. 1. 169. "Leaves ovate with a point, unarmed, almoſt entire." Native of Madeira: flowers in April and May.

4. I. *Prinoides.* Deciduous Holly. Ait. Hort. Kew. 1. 169. "Leaves elliptic-lanceolate, acute, deciduous, ſerrate, ſerratures without prickles. Native of Carolina and Virginia: flowers in July.

5. I. *Caſſine.* Dahoon Holly. Linn. Spec. 181. Reich. 1. 354. Hort. Cliff. 40. I. caroliniana; Mill. Dict. n. 3. Aquifolium carolinenſe, fol. dentatis baccis rubris. Cateſb. Carol. 1. t. 31. α. I. Caſſine latifolia. Broad-leaved Dahoon Holly. "Leaves lanceolate-oblong, ſerrate." β. I. C. anguſtifolia. Narrow-leaved Dahoon Holly. "Leaves lanceolate, almoſt quite entire." Ait. Hort. Kew. 1. 170. "Leaves alternate, diſtant, evergreen, lanceolate, ſerrate, ſerratures acuminate." Native of Florida and Carolina.

6. I. *vomitoria.* South-ſea Tea or evergreen Caſſine. Ait. Hort. Kew. 1. 170. (Caſſine Paragua; Mill. Dict. n. 2. fig. t. 83. f. 2. Pluk. Mant. t. 376. f. 2. Cateſb. Carol. 2. t. 57.) "Leaves alternate, diſtant, oblong, bluntiſh, crenate-ſerrate, ſerratures without prickles." Native of Weſt Florida. The leaves are uſed for making an infuſion in the manner of tea; which is accounted by the Indians very wholeſome, and is almoſt the only phyſic they uſe in ſome parts. The plant is ſuppoſed to be the ſame with that which grows in Paraguay, where the Jeſuits make a great revenue from the leaves.

7. I. *aſiatica.* Linn. Spec. 181. Reich. 1. 354. "Leaves broad-lanceolate, blunt, quite entire." Native of the Eaſt Indies.

8. I. *runcifolia.* Linn. Spec. 181. Reich. 1. 354. Plum. Ic. 118. 2. "Leaves wedge-form, three-cuſped." Native of South America.

9. I. *integra.* Linn. Syſt. 168. Thunb. Jap. 77. "Leaves oblong, obtuſe, entire; peduncles one-flowered."

10. I. *rotunda.* Linn. Syſt. 168. Thunb. Jap. 77. "Leaves rounded, acute, entire; peduncles umbelliferous."

11. I. *crenata.* Linn. Syſt. 168. Thunb. Jap. 78. "Leaves ovate crenate, peduncles on the branches ſcattered, bearing two or three flowers.

12. I. *emarginata.* Linn. Syſt. 168. Thunb. Jap. 78. "Leaves obovate, emarginate, flowers axillary, uſually in pairs."

13. I. *ſerrata.* Linn. Syſt. 168. Thunb. Jap. 78. "Leaves ovate, acute, ciliate, ſerrate, flowers axillary, ſolitary. Flowers in June."

14. I. *japonica.* Linn. Syſt. 168. Thunb. Jap. 79. "Leaves oppoſite ſeſſile, flowers in terminating racemes, and flowers in April."

15. I. *latifolia.* Linn. Syſt. 168. Thunb. Jap. 79. "Leaves ovate ſerrate, flowers axillary, aggregate."

16. I. *crocea.* Thunb. Prodr. 32. "Leaves oblong ſerrate, ſerratures ciliate ſpiny." Native of the Cape of Good Hope.

This genus conſiſts of ſmall trees or ſhrubs, with alternate leaves, evergreen, toothed and thorny; and axillary many-flowered peduncles. The common holly riſes from 20 to 30 feet, and ſometimes more. It grows wild in many parts of Europe, in North America, Japan, Cochinchina, &c.; and is found in woods and foreſts in many parts of England. In Engliſh it is called "Hulver" and "Holme." For its uſes, ſee Holly.

Ilex, in *Gardening*, contains plants of the hardy evergreen tree or ſhrubby kinds; of which the ſpecies moſtly cultivated are the common holly (I. aquifolium); the Dahoon holly (I. caſſine); and the South ſea tea, or evergreen caſſine (I. vomitoria).

There are a great many varieties of both the green-leaved and variegated ſorts. Of the firſt the common green-leaved prickly, the ſmooth green-leaved, the narrow ſerrated green-leaved, the green-leaved yellow-berried, the box-leaved green, and the hedge-hog green; and of the latter the common prickly, with ſilver ſtriped leaves, with gold ſtriped leaves, with blotched leaves; the ſmooth with white ſtriped leaves, with yellow ſtriped leaves, with blotched leaves, with narrow ſtriped leaves, the blotched yellow berried; the cream-coloured, the copper-coloured, the white-leaved, the mottled-edged, the hedge-hog ſilver-edged, the gold-edged hedge-hog, the white-blotched hedge-hog, the yellow-blotched hedge-hog, and the painted lady variegated.

And of the ſecond ſort there are varieties with broad leaves, and with narrow leaves, with ſcarcely any ſerratures.

Method of Culture.—Theſe plants are all capable of being increaſed from ſeeds, and by the operations of budding and grafting upon proper ſtocks.

The ſeeds or berries ſhould be ſown, as ſoon as they are perfectly ripened, in ſmall beds prepared for the purpoſe. But as they are long in germinating, it is the practice with ſome to depoſit them, for a year before they are ſown in the beds, in pots filled with earth or ſand, or in a hole in the earth, in a dry ſituation; the firſt is probably the beſt method. The plants moſtly riſe in the ſecond ſpring, when they ſhould be kept well weeded and watered. After they have had two years' growth in theſe beds they ſhould be removed, and planted out in nurſery rows at the diſtance of two feet, and one apart in the rows. They ſhould remain in theſe till of a proper ſize to be planted where they are to remain, keeping them perfectly clean, and the ground occaſionally ſtirred about them.

The proper ſeaſons for removing them are either the early autumn or ſpring; the former in dry grounds, and the latter in thoſe that are of a retentive nature.

In the ſecond ſort the ſeeds, after being prepared as above, ſhould be ſown in pots, and plunged the ſecond ſpring in a gentle hot-bed, in order to bring up the plants. They ſhould then be kept in the pots, and have protection in the winter ſeaſon till they have become of hardy growth, when they may be turned out and planted in warm ſituations. They afterwards require protection in very ſevere winters by mats or other means.

And the third ſort may be managed in the ſame way as the ſecond, the young plants being gradually inured to the open air, having only the morning ſun at firſt. They ſhould be kept in the pots four or five years, as they grow ſlowly, being well protected in the winter. They all ſucceed beſt in a dry ſoil.

All the varieties of the different ſoils are to be continued either by budding or grafting upon ſtocks of the firſt ſort. The firſt ſhould be performed in the latter part of ſummer, and the latter in the early ſpring, upon ſtocks of two years' growth. See BUDDING, GRAFTING, and INOCULATING.

All the ſorts and varieties are highly ornamental in the clumps, borders, and other parts of pleaſure-grounds, affording much variety when judiciouſly intermixed. The firſt ſort frequently riſes to a large tree, having a fine white hard wood uſeful for various purpoſes. The bark alſo affords the ſubſtance called bird-lime, which is prepared by boiling it till the green part is capable of being ſeparated from the white, then laying it in a cool cellar for a few days, afterwards pounding it till it becomes a tough paſte, waſhing it repeatedly, till it gets quite clear, then placing it in an earthen veſſel to ferment or become fine, when it will be fit for uſe.

ILEX. See HIPPOMANE and QUERCUS.

ILEX *Aquifolium*, in *Natural Hiſtory*. The leaves of this plant were found, among others, preſerved in the ſilt and peaty matters, below the ordinary level of the tides, at Sutton, in Lincolnſhire, by Dr. De Serra and ſir Joſeph Banks, in 1796. Phil. Tranſ. 1799.

ILFRACOMB, in *Geography*, is a ſea-port, market-town, and pariſh in the hundred of Braunton and county of Devon, England. It derives conſiderable trade from the herring-fiſhery in the Briſtol channel. The peculiar ſituation and ſafety of the harbour occaſion many veſſels to put in here, when it is dangerous for them to enter the mouth of the river Taw for Barnſtaple. In conſequence of this circumſtance, much of the port buſineſs of that place is tranſacted at Ilfracomb. Nature and art ſeem to have combined in forming the harbour, which, appearing like a natural baſin, is almoſt ſurrounded by craggy heights, overſpread with foliage. On three ſides the rocks riſe in a ſemicircular ſweep; and on the fourth a bold maſs of rock ſtretches nearly half-way acroſs the mouth of the bay. This rock riſes almoſt to a point; and on the top is erected a light-houſe, which has the appearance of a place of worſhip. Along the ſide of this rock, to the opening of the harbour, runs an artificial pier, judiciouſly conſtructed to prevent the accumulation of ſand; ſo that by the joint aſſiſtance of the natural barrier and this piece of maſonry, ſhips of 230 tons burthen may ride completely land-locked, and ſafe from the violence of the weather. An inſcription, over the gate of the pier, informs us that the town was indebted for this valuable addition to its convenience and advantage, to ſir Bourchier Wray, bart., who, in the year 1760, partly rebuilt, lengthened, and enlarged this extenſive barrier. Previous to the year 1731, the pier was 850 feet long, but the violence of the ſea having nearly deſtroyed it, the parliament then paſſed an act for repairing and enlarging it, with the harbour, &c. The town conſiſts principally of one well-built ſtreet, extending a mile in length, from the church to the ſea-ſide. A number of good houſes, chiefly for the ſummer accommodation of ſtrangers, is ranged along ſide of the harbour. The church is a large plain ſtructure, but not demanding any particular notice. Camden, though prebendary of this place, ſcarcely mentions it in his Britannia. The civil government of the town is veſted in a mayor, bailiffs, and other officers. Ilfracomb is 202 miles diſtant from London; has a well-ſupplied market on Saturdays; and contained, at the time of the late return to parliament, 455 houſes, and 1838 inhabitants.

Three miles eaſt of the town is Watermouth, the ſeat of Joſeph Davie, eſq. The houſe is ſituated on an eminence, having in front an inlet of the ſea, which forms a moſt beautiful baſin, environed by rocks on the right and left. The varied character of rock, lake, and dale, conſtitutes very ſingular and romantic ſcenery. Warner's Walk through the Weſtern Counties. Maſon's Obſervations on the Weſtern Counties. Beauties of England and Wales, vol. iv.

ILGINSKAIA, a town of Ruſſia, in the government of Irkutſk, at the conflux of the Ilga and Lena; 52 miles S. of Orlenga.

ILGINSKOI, a town of Ruſſia, in the government of Irkutſk, on the Ilga; 140 miles N. of Irkutſk. N. lat. 54° 30′. E. long. 105° 14′.

ILHA GRANDE, an iſland in the Atlantic, near the coaſt of Braſil, about 15 miles long and three broad. S. lat. 23° 15′.

ILHEO, a ſmall iſland in the Atlantic, near the coaſt of Africa. S. lat. 23° 30′.

ILHEOS, a ſea-port town of Braſil, and capital of a diſtrict, called "Rios dos Ilheos," ſituated at the mouth of a river of the ſame name. S. lat. 15° 25'. W. long. 36° 36'.

ILI, a river of Tartary, which runs into lake Palcati; 20 miles N.W. of Harcas.

ILIA, in *Anatomy*, the technical term for thoſe parts of the body, which are bounded by the upper broad portions of the oſſa innominata. It is one of the ſubdiviſions of the abdominal cavity. See Abdomen.

ILIABAD, in *Geography*, a town of Hindooſtan, in the Carnatic; four miles S.W. of Arnee.

ILIAC, in *Anatomy*, an epithet applied to certain organs of the body, ſituated in or near the ilia. Thus we have the common or primary ilia arteries (iliacæ communes); the external and internal iliac arteries (iliaca externa et interna); veins of the ſame names, correſponding to theſe; the poſterior iliac artery (iliaca poſterior or glutæa).

Iliac *Paſſion*, or *Ileus*, in *Medicine*, a term uſed by many modern writers to deſignate thoſe forms of inteſtinal diſeaſe, in which, after ſevere attacks of pain in the belly, the inverſion of the periſtaltic motions of the inteſtines is ſuch, as to occaſion a vomiting of feculent matter. This may happen from any great obſtruction of the bowels; but chiefly occurs when either inflammation is induced, or a ſevere ſpaſmodic conſtriction takes place in ſome part of the canal. The ileus, therefore, is only another term for inflammation of the bowels, or *enteritis* in the one caſe, and for *colic* in the other. (See theſe articles.) The name was probably appropriated with a view of diſcriminating an affection of the ſmall inteſtines, or *ilium* (εἰλεον), from a ſimilar diſorder of the large inteſtines, or *colon*, which had been termed *colica*: but ſuch diſtinction is not eaſily aſcertained; and the *ileus* can only be conſidered as an extreme degree of *colic*, where inflammation has not actually ſupervened. The terms *miſerere mei*, *volvulus*, and *chordapſus*, have alſo been uſed as appellations of the diſeaſe. All the cauſes of obſtruction to the free paſſage of the fæces along the canal of the inteſtines, inaſmuch as they commonly induce inflammation, or ſpaſmodic contraction, and invert the periſtaltic motion, may produce ileus: ſuch as *herniæ*, or ruptures, intusſuſception, *calculi*, indurated fæces, &c.; and the remedies applicable to colic and enteritis reſpectively will cure the diſeaſe. It is to be obſerved, however, that as this complete inverſion of the periſtaltic motion of the canal implies the moſt ſevere degree of theſe diſeaſes, ſo it is neceſſarily an alarming and dangerous ſymptom whenever it appears.

ILIACOUR, in *Geography*, a town of Hindooſtan, in the country of the Nayrs; 20 miles N.E. of Tellicherry.

ILIACUS Internus, in *Anatomy*; iliaque, ilio-trochantinien; a muſcle of the lower extremity, placed in the iliac foſſa, and at the upper and anterior part of the thigh, and extending from the two anterior thirds of the criſta of the ilium to the trochanter minor of the thigh-bone. It is thin and broad above, narrower and thicker below, ſo as to be in ſome degree fan-ſhaped. Its anterior ſurface is concave above and convex below: that portion of it which is above the crural arch is covered by the peritoneum, looſely attached by cellular ſubſtance, by the cæcum on the right, and by the ſigmoid flexure of the colon on the left ſide of the body. The anterior crural nerve is alſo in contact with it here. Below the crural arch, the iliacus internus is covered on the outſide by the ſartorius, on the inſide by the crural veſſels and nerve, and in the middle by the faſcia lata. The poſterior ſurface covers the iliac foſſa, and is attached to the two ſuperior thirds of this excavation; it covers alſo the anterior inferior ſpine of the ilium, and is attached to its inner edge; it then covers the upper end of the rectus, and the hip-joint, to the orbicular ligament of which it is attached.

The internal edge is covered above by the pſoas magnus: below, theſe two muſcles are united into one maſs. The outer edge is extended obliquely from the anterior ſuperior ſpine of the ilium to the baſe of the little trochanter; it is covered by the ſartorius, and covers a little of the triceps. The upper edge is attached to the two anterior thirds of the inner margin of the criſta of the ilium, and to the ilio-lumbar ligament. From theſe parts the muſcle deſcends, growing thicker and narrower. Confounded with the pſoas, it paſſes behind the crural arch, deſcends obliquely from without inwards, and is attached to the trochanter minor, and to the neighbouring part of the body of the thigh-bone.

The fleſhy fibres of this muſcle ariſe from the iliac foſſa, the criſta and ſpines of the bone, and terminate on the external and poſterior ſurface of the tendon common to it with the pſoas magnus. The internal ones are the ſhorteſt, and are nearly vertical; thoſe in the middle are longer and paſs obliquely from without inwards; the external are the longeſt and ſtill more oblique. The latter accompany the tendon even to the trochanter, and ſome are attached to the former below that proceſs.

The iliacus internus carries the thigh-bone forwards upon the pelvis, and rotates it ſo as to twiſt the limb outwards. It bends the pelvis forwards upon the thigh. It produces the firſt of theſe effects in progreſſion, when the limb, which had been left behind, is elevated and carried in front of the other: the ſecond action is exhibited when the trunk of the body is carried forwards on the limb ſo advanced.

ILIAD, Ιλιας, the name of an ancient epic poem, the firſt, and fineſt, of thoſe compoſed by Homer. See Epic *Poem*.

The critics maintain the Iliad to be the firſt, and yet the beſt, poem that ever appeared in the world: Ariſtotle's Poetics are almoſt wholly taken from it; the philoſopher had nothing to do but to form precepts from the poet's practice. Some authors tell us, that Homer invented not only poetry, but all other arts and ſciences; and that there are the viſible marks of a perfect knowledge in every one of them to be ſeen in the Iliad.

The word is derived from the Greek Ιλιας, of Ιλιον, *Ilium*, Troy, a famous city of Aſia, which the Greeks beſieged for the ſpace of ten years, and at laſt deſtroyed, on account of the rape of Helena, which makes the ſubject of the work.

The poet's deſign in the Iliad was, to ſhew the Greeks, who were divided into ſeveral little ſtates, how much it was their intereſt to preſerve a harmony and good underſtanding among them. In order to which, he ſets before their eyes the calamities that befel their anceſtors from the wrath of Achilles, and his miſunderſtanding with Agamemnon; and the advantages that afterwards accrued to them from their union. See Fable.

In order to form a proper judgment of the diſtinguiſhing excellence of this poem, it is neceſſary, ſays Dr. Blair, (Lectures, vol. iii.) that the reader ſhould tranſport his imagination almoſt three thouſand years back in the hiſtory of mankind, and conſider that he is about to peruſe the moſt ancient book in the world, next to the Bible. He will thus diveſt himſelf of all our modern ideas of dignity and refinement; nor will he be led to look for the correctneſs and elegance of the Auguſtan age. What he ought to expect is a picture of the ancient world, exhibiting characters and manners that poſſeſs a conſiderable tincture of the ſavage ſtate. The opening of the Iliad is deſtitute of that kind of dignity, which a modern expects to find in a great epic poem. The ſubject is merely the quarrel of two chieftains about a female ſlave. The prieſt of Apollo beſeeches Agamemnon to reſtore his daughter, who, in the plunder of a city, had fallen to Agamemnon's ſhare of booty. Upon his refuſal, Apollo, at the prayer of his prieſt, ſends a plague into the Grecian camp. The augur, when conſulted, declares, that Apollo cannot be appeaſed without reſtoring the daughter of his prieſt. Agamemnon is enraged at the augur; profeſſes that he likes this ſlave better than his wife Clytemneſtra; but as it was neceſſary to reſtore her in order to ſave the army, he inſiſts upon having Briſeis, the ſlave of Achilles, in her room. Achilles is enraged at this demand, reproaches him for his rapacity and inſolence, and ſolemnly ſwears, that, in revenge for this treatment, he will withdraw his troops, and afford the Grecians no farther aſſiſtance againſt the Trojans. He accordingly withdraws. His mother, the goddeſs Thetis, intereſts Jupiter in his cauſe; who, for avenging the wrong which Achilles had ſuffered, takes part againſt the Greeks, and thus plunges them into deep diſtreſs; until at length Achilles is pacified, and he and Agamemnon are reconciled. Such is the baſis of the whole action of the Iliad. (See ACTION.) In the days of Homer no ſubject could have been more happily choſen than that of the Iliad; which laid the foundation of the Trojan war. So great a confederacy as the Grecian ſtates, under one leader, and the ten years' ſiege which they carried on againſt Troy, muſt have ſpread far abroad the renown of many military exploits, and intereſted all Greece in the traditions concerning the heroes who had moſt eminently ſignalized themſelves. Upon theſe traditions Homer, who is ſuppoſed to have lived two or three centuries after the Trojan war, grounded his poem; and the interval of time that elapſed between the war and the period of his deſcribing it, left him at full liberty to blend fable with the records of true hiſtory. The ſubject of his choice was only that part of the Trojan war which comprehends the quarrel betwixt Achilles and Agamemnon, and the events reſulting from that quarrel. Theſe, though they included merely an interval of 47 days, yet occupy the moſt intereſting and moſt critical period of the war. By this management he has given greater unity to what otherwiſe would have been an unconnected hiſtory of battles. He has alſo gained one hero, or principal character, *viz.* Achilles, who reigns throughout the work; and he has ſhewn the pernicious effects of diſcord among confederated princes. The praiſe of high invention has in every age been juſtly allowed to Homer; and this invention is ſignally diſplayed in the prodigious number of incidents, of characters, divine and human, with which his poem abounds; the ſurpriſing variety with which he has diverſified his battles, in the wounds and death, and little hiſtory pieces, of almoſt all the perſons ſlain. His judgment is alſo no leſs conſpicuous than his invention. His ſtory is uniformly conducted with great art. He riſes upon us gradually; his heroes appear, in ſucceſſion, as objects of our attention: the diſtreſs thickens as the poem advances; and every thing is ſo contrived as to aggrandize Achilles, and to render him, agreeably to the intention of the poet, the capital figure. Homer, however, is principally diſtinguiſhed, above all other writers, in the characteriſtical part. His exhibition of characters is rendered lively and ſpirited by his dramatic mode of writing, or by his continually recurring to dialogue and converſation. As this is the moſt ſimple and artleſs, it is evidently the moſt ancient. See a ſpecimen of it in Gen. xlii. 7—15. To the ſpeeches of Homer, which are upon the whole characteriſtic and lively, we owe, in a great meaſure, the admirable diſplay which he has given of human nature. Every one who reads him, becomes familiarly and intimately acquainted with his heroes. We ſeem to have lived among them and converſed with them. His art in painting characters is eminently diſplayed in thoſe of Helen and Paris. As for his character of Achilles; ſee ACHILLES. The gods alſo made a great figure in the Iliad; inſomuch that Homer has become the ſtandard of poetic theology. By the intervention of his gods, he has greatly diverſified his battles; and by frequently ſhifting the ſcene from earth to heaven, the mind is agreeably relieved in the midſt of ſo much blood and ſlaughter. It has, however, been objected to Homer, that his gods want dignity; but in apology for him, it ſhould be remembered, that, according to the fables of thoſe days, the gods are but one remove above the condition of men, and poſſeſs all the human paſſions. Nevertheleſs, though Homer frequently degrades his divinities, he knows how to make them appear, in ſome conjunctures, with the moſt awful majeſty. Jupiter, the father of gods and men, is, for the moſt part, introduced with great dignity, and ſeveral of the moſt ſublime conceptions in the Iliad are founded on the appearances of Neptune, Minerva, and Apollo, on great occaſions. As to Homer's ſtyle and manner of writing, it is eaſy, natural, and in the higheſt degree animated. In his ſtyle he is the moſt ſimple of all the great poets, and in this reſpect it reſembles moſt that of the poetical parts of the Old Teſtament. Of the ſimplicity of his ſtyle, we can form no adequate idea in the midſt of the elegance and luxuriancy of the language of Mr. Pope's tranſlation, however excellent that tranſlation may be deemed as a poetical performance. In the midſt, however, of that plainneſs of diction for which Homer is diſtinguiſhed, there are every where breaking forth upon us flaſhes of native fire, of ſublimity and beauty, which hardly any language but his own could preſerve. His verſification has been univerſally acknowledged to be uncommonly melodious; and to carry, beyond that of any poet, a reſemblance in the ſound to the ſenſe and meaning. In narration, continues Dr. Blair, Homer is, at all times, remarkably conciſe, which renders him lively and agreeable; though in ſome of his ſpeeches he is tedious. He is every where deſcriptive, and deſcriptive by means of thoſe well choſen particulars, which form the excellency of deſcription. Virgil gives us the nod of Jupiter with great magnificence:

"Annuit; et totum nutu tremefecit Olympum."

But Homer, in deſcribing the ſame thing, gives us the fable eye-brows of Jupiter bent, and his ambroſial curls ſhaken, at the moment when he gives the nod; and thereby renders the figure more natural and lively. In drawing our attention to any intereſting object, he paints it in a manner to our ſight. The ſhot of Pandarus' arrow, which broke the truce between the two armies, as related in the 4th book, may be given for an inſtance, and, above all, the admirable interview of Hector with Andromache in the 6th book, where all the circumſtances of conjugal and parental tenderneſs; the child affrighted with his father's helmet and creſt, and clinging to the nurſe; Hector pulling off his helmet, taking the child into his arms, and offering up a prayer for him to the gods; Andromache receiving back the child with a ſmile of pleaſure, and at the ſame inſtant burſting into tears, δακρυοεν γελασασα, as it is finely expreſſed in the original, form the moſt natural and pleaſing picture that can poſſibly be imagined. Homer, it is obſerved, particularly excels in battles. In deſcribing theſe, his genius is moſt highly diſplayed, inſomuch that Virgil's battles, and indeed thoſe of moſt other poets, are cold and unanimated in compariſon of thoſe of Homer. No poet abounds ſo much with ſimilies. Several of theſe are extremely beautiful: ſuch as thoſe, of the ſires in the Trojan camp compared to the moon and ſtars by night; Paris going forth to battle, to the war-horſe prancing to the river; and Euphorbus ſlain, to the flowering ſhrub cut down by a ſudden blaſt; all which are among the fineſt poetical paſſages that are any where to be found. His compariſons, however, are not reckoned among his greateſt beauties, for ſeveral reaſons ſuggeſted by Dr. Blair. See Lectures, vol. iii. p. 247. For the conduct of the Iliad, ſee father Boſſu, Madam Dacier, and M. De la Motte.

The Iliad is divided into twenty-four books, which are marked with the letters of the alphabet. Pliny gives us an account of an Iliad written on ſo very ſlender a paper, that the whole might be contained in a nut-ſhell.

The ingenious Mr. Barnes, of Cambridge, has very ſtrenuouſly attempted to prove Solomon to have been the author of the Iliad.

The Engliſh tranſlation of the Iliad by Mr. Pope is well known. This tranſlation, though faithful in the main to the original, and though thought by ſome to have occaſionally improved even Homer, is nevertheleſs no other than Homer modernized. There is, as Dr. Blair obſerves, no author to whom it is more difficult to do juſtice in a tranſlation than Homer.

ILIGATANGAN, in *Geography*, one of the ſmall Philippine iſlands, N. W. of Leyta. N. lat. 11° 24'. E. long. 124°.

ILIGNO BAY, a bay on the S.W. coaſt of the iſland of Mindanao. N. lat. 7° 30'. E. long. 20°.

ILII OS, in *Anatomy*, a name given to one of the diviſions of the os innominatum. See EXTREMITIES.

ILIJA, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir, ſituated on the Euphrates; 60 miles W. of Diarbekir.

ILIM, a river of Ruſſia, which riſes in N. lat. 54° 20', and runs into the Angara, near Samakina, N. lat. 57° 25', E. long. 102° 2'.

ILIMSK, a town of Ruſſia, on the Ilim, in the government of Irkutſk, in the environs of which are found the moſt beautiful black ſables; 152 miles N. of Irkutſk. N. lat. 56° 30'. E. long. 103° 56'.

ILINSKA, a town of Ruſſia, in the government of Irkutſk, on the Lena; 56 miles N.E. of Kirenſk.

ILINSKOI, a town of Ruſſia, in the government of Tobolſk; 8 miles N. of Atchinſk. – Alſo, a town of Ruſſia, in the government of Tver; 32 miles E.N.E. of Tver.— Alſo, a town of Ruſſia, in the government of Olonetz; 8 miles N. of Olgſkoi. Alſo, a town of Ruſſia, in the government of Novgorod, on the river Sula, oppoſite to Tcherepovetz.

ILION, a town of Thibet; 25 miles W.N.W. of Haratoube.

ILION, or ILIUM, in *Ancient Geography*. See TROY.

ILIPA, ALCOLEA, a town of Spain in Bœtica, N. of Hiſpalis, upon the right bank of the Bœtis. Strabo relates, that the environs of this town had mines of ſilver. Its medals bear the head of a female, ſuppoſed to be Ceres, with emblems of abundance.

ILIPPE, in *Botany*. See BASSIA.

ILIPULA, NIEBLA, in *Ancient Geography*, a town of Spain, in Bœtica, W. of Tucci. Livy calls it *Ilipa*, but Ptolemy and M. D'Anville name it *Ilipula*.

ILIS, in *Geography*, a town of South America, in the province of Popayan; 20 miles S. of Paſto.

ILISSIDES, in *Mythology*, a ſurname of the Muſes, from the river Iliſſus in Attica, the waters of which were reckoned ſacred.

ILISSUS, in *Ancient Geography*, a town of Attica, called by Pliny "locus Iliſſos."—Alſo, a ſmall river of Attica, on the route from Athens to Cyno-Sarges, which had to the weſt a ſmall river called Eridanus. This river was conſecrated to the Muſes and other divinities.

ILITA, in *Hindoo Mythology*, a name of Parvati, conſort of Siva; ſimilar, perhaps, to *Idita*, which ſee.

ILITHYA, derived from ελευθειν, *to ſpring from*, in *Mythology*, the daughter of Juno, and ſiſter of Hebe, who preſided over deliveries. This goddeſs had a temple at Rome, in which were regiſtered the birth and death of every citizen; a cuſtom eſtabliſhed by Servius Tullius.

ILIVILIHU, in *Natural Hiſtory*, a name given by the inhabitants of the Philippine iſlands to a very remarkable ſpecies of birds, common in that country. It is called by ſome writers *coturnix parvula montana*, the ſmall mountain quail, and it is indeed a quail in all the characters; but it is very beautifully variegated in its colours, and is ſmaller than a ſparrow. It lives in hilly places, and is a very well taſted bird. See QUAIL.

ILIUM Os, *Fractures of*, in *Surgery*. See FRACTURE.

ILL, L', in *Geography*, a river of France, which riſes in the department of the Upper Rhine, near Fernette, and runs into the Rhine near Straſburg; navigable for boats from Schlettſtat.

ILLA, in *Botany*. See CALLICARPA.

ILLAHABAD, in *Geography*, a town of Hindooſtan, in the circar of Mahur; 35 miles N. of Neermul.

ILLAHON, a town of Egypt; 12 miles S.E. of Fayoum.

ILLAMBAZAR, a town of Hindooſtan, in Bengal; 25 miles S.S.E. of Nagore.

ILLE, a town of France, in the department of the Eaſtern Pyrenees, on the Teck, containing about 2000 inhabitants; 12 miles W. of Perpignan.

ILLE, a river of France, which riſes near Dingé, in the department of the Ille and Vilaine, and joins the Vilaine near Rennes.

ILLE *and* VILAINE, a department of the north-weſt region of France, bounded on the N. by the Engliſh channel, and the department of the Channel, on the E. by the department of the Mayenne, on the S. by the Lower Loire, and on the W. by the departments of the Morbihan and the North coaſt, about 60 miles in length from N. to S. and from 20 to 48 in breadth, from E. to W. It takes its name from the two rivers Ille and Vilaine, which unite together at Rennes, the capital of the department. This department contains 347 ſquare leagues, and 488,605 inhabitants. It is divided into ſix diſtricts, *viz.* St. Malo, including 101,089 inhabitants, Fougeres, 76,577, Vitré, 74,885, Redon, 66,707, Montfort, 55,971, and Rennes, 113,376. The number of cantons is 43, and of communes 352. The contributions amount to 3,014,223 fr. and the expences charged upon it to 421,093 fr. 66 cent. This department, of a clayey ſoil and interſected by gentle eminences, is indifferently fertile, and badly cultivated; producing ſcanty crops of grain, flax, fruits, and good paſtures on the borders of the rivers. The fertile marſh of Dol is reckoned the Delta of the territory. There are conſiderable foreſts, mines of iron and lead, quarries of ſtone, &c.

ILLECEBRA, in *Botany*. See SEDUM.

ILLECEBRUM, Illecebra of Pliny, pretty or enticing plants. Linn. Gen. n. 290. Reich. 313. Schreb. 407. Juſſ. 89.

89. Sm. Fl. Brit. 267. (Corrigiola, Dill. Gen. 169. Moehr 106. Paronychia, Tournef. 281.) Claſs and order, *Pentandria Monogynia.* Nat. Ord. *Holoraceæ*, Linn. *Amaranthi*, Juſſ.

Gen. Ch. *Cal.* Perianth five-leaved, cartilaginous, five-cornered; with coloured leaflets, which are ſharp with diſtant points, permanent. *Cor.* none. *Stam.* Filaments five, capillary, within the calyx. Anthers ſimple. *Piſt.* Germen ovate, ſharp, ending in a ſhort bifid ſtyle; ſtigma ſimple, obtuſe. *Peric.* Capſule roundiſh, acuminate, both ways five-valved, one-celled, covered by the calyx. *Seed* ſingle, roundiſh, ſharp on both ſides, very large.

Obſ. The fruit in ſeveral ſpecies is different.

Eſſ. Ch. Calyx five-leaved, cartilaginous. Corolla none. Stigma ſimple. Capſule five-valved, one-ſeeded.

1. I. *brachiatum.* Linn. Syſt. 247. Reich. 1. 580 (Achyranthes brachiata; Linn. Mant. 50.) "Stem upright, herbaceous, brachiate, leaves oppoſite, even, annual." Native of the Eaſt Indies.

2. I. *ſanguinolentum.* (Achyranthes ſanguinolenta; Linn. Spec. 294. Verbena rubra; Rumph. Amb. 7. 60. t. 27. f. 2.) "Fruteſcent, leaves oppoſite, ſpikes compound, heaped." Perennial. Native of the Eaſt Indies.

3. I. *canarienſe.* Linn. Syſt. 248. Suppl. 161. "Shrubby, leaves elliptic, acute, ſtipules and bractes ovate, ſhorter, panicles terminating, dichotomous." Found on the iſland of Teneriffe by Maſſon.

4. I. *lanatum.* Linn. Syſt. Reich. Ait. Hort. Kew. Lour. Cochinch. Vahl. Symb. (α. Achyranthes lanata; Linn. Spec. 296. Mill. fig. t. 11. f. 1. A. villoſa; Forſk. Deſcr. 48. n. 64. Chenopodium, Burm. Zeyl. t. 26. f. 1. Amaranthus, Pluk. Phyt. t. 75. f. 8. "Spikes ſub-aggregate, ſhorter than the leaf, branches long, rod-like." β. Great woolly illecebrum. "Spikes ſolitary, on ſpreading branchlets." γ. with round leaves. Retz. Obſ. 2. 13. n. 28. β. "Leaves ovate, ſomewhat hairy, ſpikes lateral, calyxes woolly." Native of the Eaſt Indies and Cochinchina.

5. I. *javanicum.* Linn. Syſt. Reich. Ait. Hort. Kew. (Caloſia lanata; Linn. Spec. 298. Syſt. 247. Reich. 1. 579. Mill. Dict. n. 6. Ireſine javanica; Burm. Ind. 212 t. 65. f. 2. Amaranthus albus α; Pluk. Phyt. t. 10. f. 1.) "Leaves lanceolate, tomentoſe, ſpikes cylindrical, numerous, terminating." Native of the Eaſt Indies.

6. I. *verticillatum.* Whorled knot-graſs. Linn. Spec. Reich. Hort. Cliff. Hudſ. Angl. Wither. Arr. Fl. Dan. Krock. Siles. (Corrigiola; Dill. Giſſ. 169. Raii Syn. 160. Paronychia ſerpyllifolia paluſtris; Vaill. Par. t. 15. f. 7. Tournef. par. ed. Angl. 2. 160. Polygonum ſerp. verticill. Raii Syn. ed. 2. 160. Pet. Brit. t. 10. f. 7. Polygala repens; Ger. 449. 1. Emac. 163. Park. Theat. 1333.—Nivea; Bauh. Pin. 215. "Flowers in whorls, naked; ſtems procumbent." Native of many parts of Europe in wet paſtures: flowers in July and Auguſt. This is the only Britiſh ſpecies.

7. I. *ſuffruticoſum.* Shrubby I. or knot-graſs. Linn. Sp. 298. Reich. 1. 581. (Paronychia hiſpanica fruticoſa, myrtifolia; Tourn. Inſt. 508. Mill. Dict. v. 2. n. 4.) "Flowers lateral, ſolitary, ſtems ſuffruticoſe." Native of the ſouth of Europe. Flowers from May to Auguſt.

8. I. *cymoſum.* Linn. Sp. and Syſt. Reich. Ger. Prov. 337. 3. (Polygonum capitulis ad genicula echinatis; Bocc. Sic. 41. t. 20. f. 3. Raii Hiſt. 214.) "Spikes cymed, directed one way, ſtem diffuſed." Native of the ſouth of France, the iſle of Elbe, and Portugal.

9. I. *ariſtatum.* Ait. Hort. Kew. 1. 290. "Flowers ſubfaſcicled, leaves lanceolate, ſilky, awned." Native of the Canary iſlands. Flowers in June and July.

10. I. *Paronychia.* Mountain I. or knot-graſs. Linn. Sp. Reich. Ger. Prov. (I. ſerpillifolium; Villars. Dauph. 2. 558? an polygonifolium, ejuſd. 557? Herniaria; Linn. Hor^{t}. Cliff. 41. Upſ. 54. Polygonum minus candicans; Bauh. Pin. 281. P. montanum niveum; Park. Theat. 445. 1.) "Flowers fenced with ſhining bractes, ſtems procumbent, leaves even." Native of the ſouth of Europe. Flowers in July and Auguſt.

11. I. *divaricatum.* Forked I. Ait. Hort. Kew. 1. 291. "Flowers bracted, ſubfaſcicled, peduncles dichotomous, panicled, leaves ovate-oblong, petioled." Native of the Canary iſlands. Flowers in July and Auguſt.

12. I. *capitatum.* Linn. Reich. Villars. Ger. Prov. (Herniaria erecta; Sauv. Monſp. 129. Paronychia narbonenſis erecta; Tournef. Inſt. 508. Polygonum minus candicans, &c. Magn. Monſp. P. montan. niv. minimum; Lob. Ic. 420.) "Flowers with ſhining bractes, hiding terminating heads, ſtems ſomewhat erect, leaves ciliate, villoſe underneath." Native of Provence, Spain, and the Levant.

13. I. *benghalenſe.* Linn. Reich. "Stem upright, herbaceous, leaves alternate and oppoſite, lanceolate, pubeſcent." Native of Bengal, Java, &c. in the Eaſt Indies.

14. I. *arabicum.* Linn. Reich. (Corrigiola albella; Forſk. Deſcr. 207. n. 31.) "Flowers ſcattered, heaped, bractes ſhining, equalling them, ſtems procumbent." Found in Arabia by Forſkhal.

15. I. *achyrantha.* Linn. Reich. (Achyranthes repens; Linn. Sp. ed. 1. Achyracantha repens, fol. Bliti pallidi; Dill. Elth. 8. t. 7. f. 7.) "Stems creeping, hairy, leaves ovate, mucronate; one oppoſite, ſmaller, heads ſubglobular, ſomewhat ſpiny. Native of Buenos Ayres.

16. I. *polygonoides.* Linn. Reich. (Gomphrena polygonoides; Linn. Sp. ed. 1. Herniaria; Brown. Jam. Amaranthoides; Herm. Parad. Sloan. Jam. Raii Suppl. Amaranthoides; Plum. Ic. 94. t. 21. f. 2. "Stems creeping, rough-haired, leaves broad-lanceolate, petioled, heads orbiculate, naked." Native of America on ſea-ſhores.

17. I. *ficoideum.* Linn. Reich. Jacq. Amer. Pect. 43. t. 90. (Gomphrena ficoidea; Linn. Syſt. Jacq. Amer. Amaranthoides marina, &c. Plum. Sp.) "Stems creeping, ſmooth, leaves broad, lanceolate, petioled, heads orbiculate, pubeſcent." Native of America, on the coaſt; now wild in Spain. A noxious weed in Martinico.

18. I. *ſeſſile.* Linn. Reich. Vahl. Symb. Lour. Cochinch. (Gomphrena ſeſſilis; Linn. Sp. ed. 1. Alternanthera; Forſk. Deſcr. 28. Amaranthus humilis; Burm. Zeyl. Amaranthoides humile; Pluk. Phyt. Olus Squillarum; Rumph. Amb. 6. 37. t. 15. f. 1. Coluppa; Rheed. Mal. 10. 21. t. 9.) "Stems creeping, bifariouſly tomentoſe, leaves lanceolate, ſubſeſſile, heads oblong, ſmooth." Native of the Eaſt Indies, and in wet places about Canton in China. Flowers from July to October.

19. I. *vermiculatum.* Linn. Reich. (Gomphrena vermicularis; Linn. Sp. Brown Jam. Caraxeron humile; Vaill. Act. Par. 1722. Amaranthoides humile, &c. Herm. Parad. t. 15. Amarantho affinis, &c. Breyn. Prodr. 2. Trifolii ſpica crithmum marinum non ſpinoſum braſilienſe; Raii Hiſt. 1331.) "Stems creeping, ſmooth, leaves ſubcylindric, fleſhy, heads oblong, ſmooth, terminating." Native of Brazil and Curaçoa; Jamaica, and the ſandy ſhores of South America.

20. I. *alſinefolium.* Linn. Reich. Paronychia hiſpanica ſupina alſinifolia, capitulis minoribus; Tournef. Inſt. 508. "Stems diffuſed, leaves ovate, flowers heaped, bractes ſhining." Native of Spain.

21. I. *fruteſcens.* L'Herit Stirp. Nov. 4. 75. t. 37. "Stem ſhrubby, diffuſed, dichotomous, leaves oppoſite, mealy." Flowers and ripens its ſeeds in ſummer. The Eaſt

Indian I. *Monſoniæ* has elegant ſpikes of reddiſh flowers. The whole genus requires reviſion, and a compariſon with *Herniaria*, *Celoſia*, &c.

The 7th, 8th, 10th, and 12th ſpecies, which are natives of the ſouth of Europe, may be propagated by ſeeds on a bed of light earth in the beginning of April. When the plants are come up, they ſhould be tranſplanted either into pots, or a warm dry border, watering and ſhading them, till they have taken new root. In an ordinary winter they will live in England in the open air. Thoſe that are in pots ſhould, in ſevere winters, be placed in a common frame, ſo as to enjoy the open air in mild weather, and be ſcreened from froſt. They may be alſo increaſed by cuttings, which, taken off in May or June, and planted in a ſhady border, will in two months put out roots; in moiſt weather they may be tranſplanted, and treated as the old plants. The reſt, 4, &c, being natives of the Eaſt and Weſt Indies, and other hot climates, are tender and will not thrive in the open air in England; their ſeeds muſt therefore be ſown on a hot-bed in ſpring; and afterwards, if they are plunged into the tan-bed in the ſtove, their branches will put out roots, by which they may be propagated in plenty.

ILLEGITIMATE Birth, or *Delivery*, in *Law*. See Delivery, and Abortion.

ILLENAS, Los, in *Geography*, a town of the iſland of Hiſpaniola; ſeven miles N. of St. Domingo.

ILLESEAS, a town of Spain, in New Caſtile, ſituated about midway in the road from Toledo to Madrid; containing two pariſhes and three convents; 15 miles S.S.W. of Madrid.

ILLEVIABLE, in *Law*, a debt or duty which cannot, or ought not, to be levied.

The word *nihil* is uſually ſet on a debt, or due, that is illeviable.

ILLIBERIS, in *Ancient Geography*, ſince called *Helena*, a town of Gaul, at the foot of the Pyrenées, upon the ſea-coaſt towards the eaſt; now *Elne*.

ILLICI, or Illice, a town of Spain, in the Tarragonenſis, upon the gulf called "Illicitanus Sinus."

ILLICIUM, *ab illiciendo*, in *Botany*, denoting an *inticing* plant, from its being very fragrant and aromatic. Linn. Gen. n. 611. Reich. 746. Schreb. 940. Mant. 167. Ellis in Phil. Tranſ. for 1770. Gærtn. t. 69. Juſſ. 280. Claſs and order, *Polyandria Polygynia.* Nat. Ord. *Coadunatæ*, *Magnoliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſix-leaved, deciduous, the three inferior leaflets oval; the three ſuperior alternate ones narrower and reſembling petals. *Cor.* Petals many (27), diſpoſed in a triple ſeries; the nine inferior obtuſe, concave, the nine middle ſhorter and narrower; the interior nine ſtill ſhorter and narrower. *Stam.* Filaments very many (30), ſhort, depreſſed; anthers upright, oblong, obtuſe, emarginate. *Piſt.* Germens very many (20), diſpoſed in a circle, ending in very ſhort ſpreading ſtyles; ſtigmas at the upper ſide of the ſtyle, oblong. *Peric.* Capſules ſeveral (commonly eight, Loureir.), ovate, compreſſed, hard, ſpreading into a circle, bivalve, (one-valved, L. opening at the upper edge, G.) *Seed* ſolitary, ovate, rather compreſſed, gloſſy.

Eſſ. Ch. Calyx ſix-leaved. Petals 27. Capſules ſeveral, diſpoſed in a circle, bivalve, one-ſeeded.

1. I. *aniſatum*, yellow-flowered aniſeed-tree. Linn. Sp. 664. Syſt. 507. Reich. 2. 624. Gærtn. Fruct. 1. 338. Lour. Cochinch. 353. Thunb. Jap. 235. Berg. Mat. Med. 514. (Zingi fructus ſtellatus ſ. Aniſum Indicum; Bauh. Hiſt. 1. 485. Somo vulgo ſkimmi; Kæmpf. Amœn. 880. t. 881.) "Flowers yellow." This plant is ſtomachic and carminative, and is uſed in the Eaſtern countries in the colic, rheumatiſm, &c. In China it is uſed for ſeaſoning ſweet diſhes. In Japan they place bundles and garlands of the aniſeed-tree in their temples before their idols, and on the tombs of their friends. They alſo uſe the powdered bark as incenſe to their idols.

2. I. *floridanum*, red-flowered aniſeed-tree. Linn. Reich. Ellis in Phil. Tranſ. 1770, vol. 60. p. 524. Gærtn. Fruct. 1. 339. Hortus Kewenſ. 2. p. 250. "Flowers red." Native of Florida.

The aniſeed-tree may be propagated by ſeeds, if they can be procured; or by laying down the young branches; or by cuttings which ſtrike freely. It requires the ſame treatment as *Gardenia*; which ſee.

ILLIERS, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Chartres; 12 miles S.W. of Chartres. The place contains 2617 inhabitants, in 9383 cantons, on $232\frac{1}{2}$ kiliometres and 20 communes.

ILLIMANI, a mountain of Peru, near La Paz, ſuppoſed to contain immenſe quantities of gold.

ILLINITIONS, in *Geology*, is uſed by Mr. Kirwan (Geolog. Eſſays, p. 152.) to denote the divided maſſes of argillaceous iron ore, thought by Buffon and others, without ſufficient reaſon, to owe their origin to decayed vegetables.

ILLINOIS, in *Geography*, a lake of North America, about 20 miles long and five broad in the middle. The inhabitants of the adjacent country are called Illinois Indians. The number of warriors is about 260. N. lat. 40° 35′. W. long. 89° 18′.

Illinois, or *Illini*, a river which riſes from the lake Illinois, and runs into the Miſſiſſippi, N. lat. 38° 40′. W. long. 92° 12′. The lands on the banks of the Illinois, particularly on the S.E. ſide, are perhaps as fertile as any part of N. America. They produce, in the moſt luxuriant plenty, wheat, rye, Indian corn, peas, beans, flax, hemp, tobacco, hops, grapes, apples, pears, peaches, dyeing roots, medicinal plants, &c. Here alſo are found large foreſts of hiccory, oak, cedar, mulberry trees, &c. Savannas, or natural meadows, are both numerous and extenſive. On the N.W. ſide of this river are a coal mine, half a mile in extent, and two ſalt ponds, 100 yards in circumference, and ſeveral feet in depth. The Illinois furniſhes a communication with lake Michigan, by Chiago river, between which and the Illinois are two portages not exceeding in length four miles. The whole length of the river from the ſource of Theakiki, which is at a ſhort diſtance from the river St. Joſeph, oppoſite to fort Joſeph on the N., is 480 miles. The Indians have ceded to the United States, by the treaty of Greenville, in 1795, a tract of land 12 miles ſquare, at or near the mouth of the Illinois, and alſo a tract 6 miles ſquare, near the ſouth end of Illinois lake. This lake is merely a dilatation of the river, and is ſituated about 240 miles below the ſource of Theakiki, and 43 below the ſalt-ponds.

ILLISIO, in *Surgery*, a bruiſe or contuſion.

ILLITERATURE, in *Law*; if an illiterate man be to ſeal a deed, he is not bound to do it, if none be preſent to read it, if required: and reading a deed falſe will make it void. (2 Rep. 3. 11.) A man may plead *non eſt factum* to a deed read falſe; as when a releaſe of an annuity was read to an illiterate perſon, as a releaſe for the arrears only, &c. agreed to be releaſed. (Moore, 148.) If there is a time limited for a perſon to ſeal a writing; in ſuch caſe illiterature ſhall be no excuſe; becauſe he might provide a ſkilful man to inſtruct him: but when he is obliged to ſeal it upon requeſt, &c. there he ſhall have convenient time to be inſtructed. 2 Nelſon's Abr. 946.

ILLITURGI, in *Geography*, a town of Spain, in Bœtica, ſituated towards the N.E. upon the Bœtis.—Alſo, a town of Hiſpania Tarragonenſis, on this ſide of the Ebrus.

ILLOK, a town of Sclavonia, ſituated on the Danube; 16 miles W. of Peterwaradin. N. lat. 45° 23′. E. long. 18° 8′.

ILLORA, a town of Spain, in the province of Grenada; 16 miles N. of Loja.

ILLOSIS, from ειλειν, *to turn round*, in *Surgery*, a diſtortion of the eyes.

ILLUMINATION, in a *general ſenſe*, denotes the act of a luminous body, or a body that emits light; ſometimes, alſo, the ſtate of an opaque body that receives it.

Illumination, *Circle of.* See Circle.

ILLUMINATIVE *lunar month.* See Month.

ILLUMINATORS, artiſts whoſe province it was, by a kind of miniature painting, to embelliſh books with ornamented letters and ſmall paintings. The practice is of great antiquity.

ILLUMINED, Illuminati, a *Church term*, anciently applied to ſuch perſons as had received baptiſm.

This name was occaſioned by a ceremony in the baptiſm of adults: which conſiſted in putting a lighted taper in the hand of the perſon baptized, as a ſymbol of the faith and grace he had received in the ſacrament.

Illumined, Illuminati, is alſo the name of a ſect of heretics, who ſprang up in Spain about the year 1575, and were called by the Spaniards, *Alumbrados*.

Their principal doctrines were, that, by means of a ſublime manner of prayer, which they had attained to, they entered into ſo perfect a ſtate, that they had no occaſion for ordinances, ſacraments, or good works: and that they could give way, even to the vileſt actions, without ſin.

The ſect of the illumined was revived in France in the year 1634, and were ſoon after joined by the Guerinets, or diſciples of Peter Guerin, who together made but one body, called alſo illumined: but they were ſo hotly purſued by Louis XIII. that they were ſoon deſtroyed.

The brothers of the Roſy Croſs are ſometimes alſo called Illumined. See Rosycrucian.

ILLUSTRIOUS, Illustris, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was firſt given to the moſt diſtinguiſhed among the knights who had a right to bear the latus clavus: afterwards, thoſe were entitled illuſtrious who held the firſt rank among thoſe called *honorati;* that is, the præfecti prætorii, præfecti urbis, treaſurers, comites, &c.

There were, however, different degrees among the illuſtres: as in Spain, they have grandees of the firſt and ſecond claſs, ſo in Rome they had their illuſtres, whom they called great, *majores;* and others leſs, called *illuſtres minores*. For inſtance, the præfectus prætorii was a degree below the maſter of the offices, though they were both illuſtres.

The novels of Valentinian diſtinguiſh as far as five kinds of illuſtres; among whom, the *Illuſtres adminiſtratores* bear the firſt rank.

ILLYRIA, Illyricum, or Illyris, in *Ancient Geography*, a country of Europe, the boundaries of which have not been preciſely aſcertained. It was wholly contained between the rivers Naro or Narenta and Drilo. Some authors, among whom we may reckon Pliny and Ptolemy, extend the limits of this country ſo as to include Liburnia and Dalmatia, which ſee reſpectively. M. D'Anville has aſſigned to Illyricum the whole country which lies between Iſtria and the ſmall river Arſia, as far as the mouth of the Drilo; but he obſerves, that the Illyric nations extend much farther. The rivers of Illyricum are the Arſia, forming the boundary of Italy, Oeneus, Tedanius, Titius, Naro, and Drinus or Drilo. The mountains form an elevated and extenſive chain, ſeparating Illyricum from Pannonia. Part of this chain bears the name of Albius or Albanus Mons, and conſidered as a kind of continuation of the Carnic Alps, traverſes Illyricum through its whole length from W. to E., as far as mount Scardus in Dardania. The ſea coaſt is covered with a number of iſlands. It appears from an inſcription of Gruter, that Illyricum was divided by Auguſtus into two provinces, the Superior and Inferior; but the ſituation of each is left doubtful by ancient hiſtorians and geographers. According to Ptolemy, the whole of Illyricum was divided into Liburnia and Dalmatia; and it was bounded on the N. by Pannonia, part of it having Iſtria on the weſt; on the E. by Mœſia Superior, and on the S. by Macedonia, and alſo on the coaſt by the Adriatic gulf. In the ſeas that waſhed the coaſts of Liburnia and Dalmatia there were ſeveral iſlands, called the Illyric iſlands.

ILM, or Stadt-Ilm, in *Geography*, a town of Germany, in the county of Schwartzburg Rudolſtadt, on the Ilm; 14 miles S. of Erfurt. N. lat. 50° 46′. E. long. 11° 9′.

ILMAWAY, a town on the W. coaſt of the iſland of Samar. N. lat. 11° 39′. E. long. 124° 50′.

ILMEN, a lake of Ruſſia, in the government of Novogorod, on which ſtands the ancient city of this name, about 48 miles long, and from 12 to 18 wide.

ILMENAU, a town of Germany, in the county of Henneberg, on the ſide of the Elbe, near which are ſome mines of ſilver and copper; 10 miles E. of Schmalkalden.

ILMINSTER, a market town and pariſh in the hundred of Abdick, and county of Somerſet, England. It contained, in the year 1800, 366 houſes, and 2045 inhabitants. This place appears to have been of ſome note in the time of the Saxons: for Ina, king of the Weſt Saxons, gave the church and manor to the abbey of Michelney, in this county. To this monaſtery it continued annexed till the diſſolution of religious houſes in the time of king Henry VIII. This monarch granted it to Edward, earl of Hereford; but on this nobleman's attainder, in 1551, Ilminſter reverted to the crown. It was afterwards granted to the Seymour family, and in 1793 belonged to John Hanning, eſq. of Barrington court. The church is a large handſome edifice, and was made prebendal in the time of king Richard I. Among other monuments it contains, is one to the memory of Nicholas and Dorothy Wadham, the founders of a college in Oxford, bearing their name. In this church were four chantries, reſpectively dedicated to St. Mary, St. Catharine, the Holy Croſs, and St. John the Baptiſt. The town conſiſts of two principal ſtreets, one of which extends nearly a mile in length; and the other about half a mile. In the year 1491 a fire conſumed ſeveral houſes here. Previous to the Norman conqueſt this town was privileged with a market. Near the centre of the town is a commodious market-houſe, or town-hall; alſo a long range of ſhambles. The cloth manufacture formerly flouriſhed here to a very great degree; and at preſent a conſiderable buſineſs prevails in the manufactory of narrow cloths. A free German ſchool was founded here in the year 1550 by Humphrey Walrond and Henry Greenfield. Since the firſt endowment the revenues have been greatly increaſed by ſubſequent benefactions. This pariſh is divided into five tithings, and comprehends eight hamlets. The market is held on Saturdays, and an annual fair is held the laſt Wedneſday in Auguſt. Collinſon's Hiſtory, &c. of Somerſetſhire, vol. i.

ILMOLA, a town of Sweden, in the government of Waſa; 44 miles N.E. of Chriſtianſtadt.

ILOCCOS, a province of the iſland of Luçon.

ILOMANTZ, a town of Sweden, in the government of Kuopio; 90 miles E. of Kuopio.

ILORCIS, in *Ancient Geography*, *Lorca*, a town of

Hither Spain, towards the weſt of Carthago Nova, called by Pliny "Monumentum Scipionis."

ILORI, in *Geography*, a town of Mingrelia, on the coaſt of the Black ſea; 14 miles S.E. of Iſgaur. N. lat. 43° 8′. E. long. 40° 42′.

ILSBO, a town of Sweden, in the province of Helſingland; 9 miles N. of Hudwickſwall.

ILSLEY, EAST, or *Market Ilſley*, anciently *Huldeſley*, or *Hildeſley*, is a ſmall market town in the hundred of Compton, Berkſhire, England. It is 53 miles diſtant from London; and was returned to parliament in the year 1801, as containing 114 houſes and 512 inhabitants. A weekly market is held on Wedneſdays, and it has two fairs annually. But the town is principally noticed for its ſheep market, which, next to that of the metropolis, is ſuppoſed to be the largeſt in England. It commences on Wedneſday, in Eaſter week, and continues to be held every alternate Wedneſday till Midſummer. This market of late years has become of the firſt importance; the annual average of ſheep ſold being upwards of 250,000, compriſing lambs, tegs, wethers, and ewes. The principal purchaſers are the farmers of Hertfordſhire and Buckinghamſhire, in which counties they are afterwards fatted for the London market. At Kates-Gore, in the pariſh of Eaſt Ilſley, were large ſtables, built by William, duke of Cumberland. Lyſons's Magna Britannia, vol. i.

ILST, or YLST, a town of Holland, in the department of Frieſland, defended by a ditch filled with waters by the river Weymer; 12 miles N.E. of Staveren.

ILSTORP, a town of Sweden, in Weſt Gothland; 27 miles S.S.E. of Gotheborg.

ILTEN, a town of the principality of Luneberg; 16 miles S.S.W. of Zelle.

ILTERIB, a town of Syria, in the pachalic of Aleppo; 15 miles N.W. of Aleppo.

ILUA, in *Ancient Geography*, called alſo *Ætolia*, an iſland in the Mediterranean, on the coaſt of Etruria. See ELBA.

ILUCHANO, in *Geography*, a town of Ruſſia, in the government of Upha; 32 miles S.S.E. of Menzelinſk.

ILUCIA, in *Ancient Geography*, a town of Hither Spain, belonging to the Oretani.

ILU-MULU, in *Botany*. See SPINIFEX.

ILUNUM, in *Ancient Geography*, a town of Spain, in the Tarragonenſis, belonging to the Baſtitani. Ptol.

ILURBIDA, a town of Spain, in the Tarragonenſis, in the country of the Carpetani. Ptol.

ILWILTZKOLSTE, in *Geography*, a town of Sweden, in the province of Skonen; 10 miles S. of Chriſtianſtadt.

ILY, in *Botany*. See ARUNDO *bambos*.

ILYE, in *Geography*, a town of Tranſilvania, on the river Maros; 32 miles S.S.W. of Weiſenburg.

ILZA, a town of Auſtrian Poland, in the palatinate of Sandomirz; 14 miles S. of Radom.

IMABARI, a town of Japan, on the N. coaſt of the iſland of Xicoco. N. lat. 34°. 10′. E. long. 134° 20′.

IMAGE, IMAGO, in *Optics*, a natural, lively repreſentation of an object, oppoſed to a ſmooth, well-poliſhed ſurface, or mirror.

The Latin word, *imago*, comes originally from the Greek μιμεισθαι, *imitari*, to *imitate*, or *mimic*.

IMAGE, taken more largely, denotes the ſpectre, or appearance, of an object; whether by reflection or refraction.

In all plane mirrors, the image is of the ſame magnitude as the object; and appears as far behind the mirror, as the object is before it.

In convex mirrors, the image appears leſs than the object; and farther diſtant from the centre of the convexity than from the point of reflection.

Mr. Molyneux gives the following rule for finding the diameter of an image, projected in the diſtinct baſe of a convex mirror; as the diſtance of the object from the mirror is to the diſtance from the image to the glaſs; ſo is the diameter of the object to the diameter of the image. See LENS, MIRROR, REFLECTION, and REFRACTION.

IMAGE is alſo uſed for the trace, or mark, which outward objects impreſs on the mind, by means of the organs of ſenſe. See IDEA.

IMAGE alſo ſignifies an artificial repreſentation performed by man; as in painting, ſculpture, and the like. In which ſenſe the word is now generally uſed in ſpeaking of things holy, or imagined to be ſo.

The noble Romans preſerved the images of their anceſtors with a great deal of care and concern, and had them carried in proceſſion at their funerals and triumphs: theſe were commonly made of wax, or wood; though ſometimes of marble, or braſs. They placed them in the veſtibules of their houſes; and they were to ſtay there, even if the houſe happened to be ſold, it being accounted impious to diſplace them. Appius Claudius was the firſt who brought them into the temples, in the year of Rome 259, and he added inſcriptions to them, ſhewing the origin of the perſons repreſented, and their brave and virtuous achievements.

It was not, however, allowed for all who had the images of their anceſtors in their houſes, to have them carried at their funerals; this was a thing only granted to ſuch as had honourably diſcharged themſelves of their offices: for thoſe who failed in this reſpect forfeited that privilege; and in caſe they had been guilty of any great crime, their images were broken to pieces.

The Jews abſolutely condemn all images, and do not ſo much as ſuffer any ſtatues or figures in their houſes, much leſs in their ſynagogues, or places of worſhip.

The uſe and adoration of images are things that have been a long time controverted in the world.

It is plain from the practice of the primitive church, recorded by the earlier fathers, that Chriſtians, for the firſt three centuries after Chriſt, and the greater part of the fourth, neither worſhipped images nor uſed them in their worſhip. However, the greater part of the Popiſh divines maintain, that the uſe and worſhip of images were as ancient as the Chriſtian religion itſelf: to prove this, they allege a decree, ſaid to have been made in a council held by the apoſtles at Antioch, commanding the faithful, that they may not err about the object of their worſhip, to make images of Chriſt and worſhip them. (Baron. ad an. 102.) But no notice is taken of this decree till 700 years after the apoſtolic times after the diſpute about images had commenced. The firſt inſtance that occurs in any credible author of images among Chriſtians, is that recorded by Tertullian de Pudicit. c 10. of certain cups, or chalices, as Bellarmine pretends, on which was repreſented the parable of the good ſhepherd carrying the loſt ſheep on his ſhoulders: but this inſtance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or chalices. Another inſtance is taken from Euſebius, Hiſt. Eccl. lib. vii. cap. 18. who ſays, that in his time, there were to be ſeen two braſs ſtatues in the city of Paneas, or Cæſarea Philippi; the one of a woman on her knees, with her arms ſtretched out, the other of a man over-againſt her, with his hands extended to receive her; theſe ſtatues were ſaid to be the images of our Saviour, and the woman whom he cured of an iſſue of blood. From the foot of the ſtatue repreſenting our Saviour, ſays the hiſtorian, ſprung up an exotic plant, which, as ſoon as it grew to touch the border of his garment, was ſaid to cure all ſorts of diſtempers. Euſebius, however, vouches none of theſe things: nay, he ſuppoſes that the woman who erected this ſtatue of our Saviour was a Pagan, and aſcribes it to a Pagan cuſtom. Farther, Philoſtorgius, Eccl. Hiſt. lib. vii. c. 3. expreſsly ſays, that this ſtatue was carefully preſerved by the Chriſtians, but that they paid no kind of worſhip to it, becauſe it is not lawful for Chriſtians to worſhip braſs or any other matter. The primitive Chriſtians abſtained from the worſhip of images, not, as the Papiſts pretend, from tenderneſs to heathen idolaters, but becauſe they thought it unlawful in itſelf to make any images of the Deity. (Juſtin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Dei. lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symp. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 202.) Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the ſecond commandment, the arts of painting and engraving were rendered unlawful to a Chriſtian, ſtyling them evil and wicked arts. (Tert. de Idol. cap. 3. Clem. Alex. Admon. ad Gent. p. 41. Orig. contra Celſum, lib. vi. p. 182.) The uſe of images in churches, as ornaments, was firſt introduced by ſome Chriſtians in Spain, in the beginning of the fourth century; but the practice was condemned, as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preſerved by Jerome (tom. ii. ep. 6.), bears ſtrong teſtimony againſt images, and may be conſidered as one of the firſt Iconoclaſts. The cuſtom of admitting pictures of ſaints and martyrs into the churches, for this was the firſt ſource of image worſhip, was rare in the latter end of the fourth century; but became common in the fifth: however, they were ſtill conſidered only as ornaments; and, even in this view, they met with very conſiderable oppoſition. In the following century the cuſtom of thus adorning churches became almoſt univerſal, both in the Eaſt and Weſt. Petavius expreſsly ſays (De Incar. lib. xv. cap. 14.), that no ſtatues were yet allowed in the churches; becauſe they bore too near a reſemblance to the idols of the Gentiles. Towards the cloſe of the fourth or beginning of the fifth century, images, which were introduced by way of ornament, and then uſed as an aid to devotion, began to be actually worſhipped. However, it continued to be the doctrine of the church in the ſixth and in the beginning of the ſeventh century, that images were to be uſed only as helps to devotion, and not as objects of worſhip. The worſhip of them was condemned in the ſtrongeſt terms by pope Gregory the Great; as appears by two letters of his written in 601. From this time, to the beginning of the eighth century, there occurs no ſingle inſtance of any worſhip given, or allowed to be given, to images, by any council or aſſembly of biſhops whatever. But they were commonly worſhipped by the monks and populace in the beginning of the eighth century; inſomuch, that in the year 726, when Leo publiſhed his famous edict, it had already ſpread into all the provinces ſubject to the empire. See the hiſtory of the oppoſition to them under ICONOCLASTS. See Bower's Hiſt. of the Popes, vol. iii. p. 202, &c.

The Lutherans condemn the Calviniſts for breaking the images in the churches of the Catholics, looking on it as a kind of ſacrilege; and yet they condemn the Romaniſts (who are profeſſed image-worſhippers) as idolaters: nor can theſe laſt keep pace with the Greeks, who go far beyond them in this point; which has occaſioned abundance of diſputes among them. See ICONOCLASTS.

The Mahometans have a perfect averſion to images; which was what led them to deſtroy moſt of the beautiful monuments of antiquity, both ſacred and profane, at Conſtantinople.

The method of caſting images, &c. among the Hindoos, is in the uſual ſtile of ſimplicity, that, with the little variety of tools obſerved to be in uſe, has been ſo frequently remarked of eaſtern people. The following paragraph from the Hindoo Pantheon is deſcriptive of this proceſs of Indian metallurgy. "The reaſon why an exact duplicate of an image is a proof of its not being of Hindoo workmanſhip, will appear in the deſcription of their mode of caſting in metals. Firſt, the artiſt makes in wax the exact model, in every particular, of his intended ſubject, be it what it may, whether an image of a deity, or the hinge of a box: over this he plaſters a covering of fine clay, well moiſtened and mixed, leaving an aperture at ſome part; when dry it is put on a fire, with the hole downwards, and the wax, of courſe, melts out. The plaſter is now a mould, and receives at the aperture the molten metal, giving it externally, when cool, the exact form of its own concavity; in other words, of its original waxen model. The plaſter or cruſt, or mould, is now broken off, and the image (ſay) is produced ſometimes ſufficiently correct to require no after-poliſhing. The beautiful ſpecimens of Hindoo mythology caſt at Benares, under the ſuperintendance of Mr. Wilkins and ſome Pandits, have never ſince received the leaſt poliſh or filing; but are now ſeen at the India-houſe muſeum, exactly as they made their firſt appearance from the mould: from theſe claſſical ſubjects ſeveral of my plates have been engraved.

"That Hindoo caſts have but little muſcular expreſſion, is not, perhaps, to be conſidered altogether as defective, or attributed to want of ſkill in the artiſts. The human ſubject with them is rounder and plumper, leſs marked by angles and muſcles, than the harder and ruder perſons of higher latitudes, who, of courſe, exhibit more "nerve and pith." The models from which Hindoo founders have borrowed their forms, partake more of the roundneſs of Apollo, than of the muſcle of Hercules." Hin. Pan. p. 420.

IMAGE, in *Rhetoric*, alſo ſignifies a lively deſcription of any thing in a diſcourſe.

Images, in diſcourſe, are defined, by Longinus, to be, in general, any thoughts proper to produce expreſſions, and which preſent a kind of picture to the mind.

But, in the more limited ſenſe, he ſays, images are ſuch diſcourſes as come from us, when, by a kind of enthuſiaſm, or an extraordinary emotion of the ſoul, we ſeem to ſee the things whereof we ſpeak, and preſent them before the eyes of thoſe who hear us.

Images, in rhetoric, have a very different uſe from what they have among the poets: the end principally propoſed in poetry is aſtoniſhment and ſurprize; whereas the thing chiefly aimed at in proſe is to paint things naturally, and to ſhew them clearly. They have this, however, in common, that they both tend to move, each in its kind.

Theſe images, or pictures, are of vaſt uſe, to give weight, magnificence, and ſtrength to a diſcourſe. They warm and animate it; and, when managed with art, according to Longinus, ſeem as it were to tame and ſubdue the hearer, and put him in the power of the ſpeaker. See HYPOTYPOSIS.

IMAGINARY QUANTITIES, or *Impoſſible Quantities*, in *Algebra*, are certain expreſſions that ariſe in various algebraical and trigonometrical operations, to which no value, either rational or irrational, can be aſſigned, yet being ſubſtituted in the equations whence they were deduced, are found to anſwer the condition of the queſtion. Theſe expreſſions ariſe in the extraction of the even roots of a negative quantity, and may be all reduced to one of the forms $a \sqrt{-1}$, or $b + a\sqrt{-1}$; a part only of this latter form being imaginary, but this, when taken collectively with the other part, renders the whole expreſſion, like itſelf, imaginary. Whenever a quantity of this kind ariſes in the ſolution of a problem, it indicates that there are ſome conditions ſuppoſed that are impoſſible, and hence it may be ſaid, that an imaginary expreſſion is a ſign of impoſſibility. Thus, for example, let there be propoſed the two equations $x + y = 10$, and $xy = 26$, to find x and y. Firſt, $x = \frac{26}{y}$, therefore $\frac{26}{y} + y = 10$, or $y^2 - 10y = -26$; whence is obtained $y = 5 \pm \sqrt{-1}$, which is an imaginary expreſſion; and hence we conclude, that the two conditions in the problem propoſed were inconſiſtent with each other; that is, the product of no two quantities, whoſe ſum is equal 10, can be equal to 26; or 10 cannot be divided in two parts, ſuch that their product ſhall be equal to 26. But if we ſubſtitute this value of y in the equation $y^2 - 10y = -26$, it will be found to anſwer the conditions required.

The firſt notice that is taken of imaginary expreſſions, or of the ſquare root of negative quantities, is found in Cardan's algebra, who was moſt probably firſt led to the conſideration of them, from the ſolutions of thoſe cubic equations, which are now termed irreducible, and in which ſuch expreſſions always ariſe, the roots of them being of the form $x = \sqrt[3]{b + a\sqrt{-1}} + \sqrt[3]{b - a\sqrt{-1}}$, each of which parts are imaginary; and thus it is, that ſome compenſation takes place, and the root, though expreſſed in ſuch terms, that no value can be given to either, is notwithſtanding equal to a real quantity; this very ſingular circumſtance, as ſoon as it was obſerved by Cardan, would no doubt lead him to an inveſtigation of this ſpecies of quantity, but neither he, nor any other author, has yet been able to unravel the myſteries that theſe ſymbols involve, nor has any ſubject of mathematical enquiry led to more angry diſputes: ſome aſſerting that ſuch expreſſions as the mind can form no conception of, or at leaſt of what they are intended to repreſent, ought not to be introduced into a ſcience, the excellence of which conſiſts in the rigour and evidence of its demonſtrations, and that reſults thus obtained are unworthy of notice. On the other hand, it has been contended, that in all caſes where the reſults thus deduced have been compared with thoſe ariſing from the ſtricteſt geometrical inveſtigations, they have always been found perfectly to agree; and that the ſymbol $\sqrt{-1}$, although we can form no idea of what it repreſents, yet that being ſubjected to the ſame rules as other analytical ſymbols, the reſults derived from its introduction, are equally certain and concluſive: while others, taking a mean between theſe extremes, admit, that though, from analogy, there is no reaſon to doubt the truths obtained by means of theſe imaginary ſymbols, yet that it always adds a degree of conviction, when the reſults are verified by a more rigid analyſis, and conſequently that they ought not to be employed when other means are equally ſucceſsful. Baron Maſeres is decidedly of the firſt of theſe opinions, on which ſubject he has a work, entitled "A Diſſertation on the Uſe of the negative Sign in Algebra;" in which is demonſtrated the nature of thoſe ſigns, and the rules that are commonly given for working with them, and where he has alſo ſhewn, that equations of the ſecond and third degree may be effected without this introduction, or at leaſt without the conſideration of negative roots. Mr. Woodhouſe's opinion on this ſubject may be ſeen in his "Analytical Calculations;" and a very ingenious paper on the ſame head is inſerted in the "Philoſophical Tranſactions" for 1778, by profeſſor Playfair of Edinburgh, who has there given us ſeveral examples in which theſe imaginary expreſſions may be introduced to advantage into trigonometrical and other ſpecies of calculation.

Of the Algorithm of Imaginary Quantities.—After what has been ſaid of the various opinons entertained by different able mathematicians on this ſubject, it will not be ſurpriſing to find that the algorithm of theſe quantities has alſo been unſettled, ſuch as the rules for multiplication, diviſion, and involution; ſome authors making the reſults in theſe operations different from others, and each aſſigning reaſons for the rules he has given; it will, however, be uſeleſs to follow them through their particular arguments, as there are ſome of them ſpecious, and many of them fallacious; we ſhall therefore barely ſtate thoſe reaſons on which the rules now commonly adopted are founded. It is an eſtabliſhed principle in algebra, that $+a \times +a = a^2$, and $-a \times -a = a^2$; and hence, converſely, it follows, that $\sqrt{a^2} = +a$, or $-a$; but this ambiguity has no place, if we know how a^2 was generated, and have occaſion to retrace the ſteps of our operation; that is, we cannot ſay that $\sqrt{-a \times -a} = \pm a$; nor that $\sqrt{+a \times +a} = \pm a$; but the ſquare root of a^2, in both theſe caſes, is determined; that is, when conſidered with regard to its generation it has only one root; whereas, had its origin not been known, we muſt have given the ambiguous ſign to the root a, and for this obvious reaſon, that we know not when a^2 is unconditionally aſſumed, whether it be the repreſentative of $(+a)^2$, or $(-a)^2$; theſe being both expreſſed by the ſame ſymbol a^2. The reſtriction of which we have been ſpeaking, ſometimes takes place in equations; thus, for example, ſuppoſe it were required to find the value of x in the equation $\sqrt{12 + x} = 6 + \sqrt{x}$; we ſoon find $x = 4$; but there is this limitation, that the ſquare root of x, or of 4, muſt neceſſarily be -2, and not $+2$; as the latter ſuppoſition will not anſwer the conditions of the equation; and the reaſon is obvious, namely, that we firſt found $\sqrt{x} = -2$; and then $x = 4$; but now, in re-tracing our ſteps, we muſt remember how this 4 was generated, and that it has not two roots, or has not the ambiguous ſign belonging to it, as the ſquare root of 4 would have if unconditionally aſſumed; in fact, the ambiguity in the extraction of the ſquare root ariſes only in thoſe caſes in which we are unacquainted with the generation of the quantity whoſe root is to be extracted; and here it muſt neceſſarily occur, becauſe we have before agreed to repreſent both $(+a)^2$ and $(-a)^2$ by the ſame character a^2.

If therefore it be required to find the product of $\sqrt{-1} \times \sqrt{-1}$, we ſee immediately that it is equal to $\sqrt{(-1)^2} = \sqrt{1}$; but under this limitation, that the root can only be expreſſed by -1, and therefore this product may always be repreſented by -1; or by $-\sqrt{1}$; and it can never have any other form. If the product $\sqrt{-1} \times \sqrt{-1} \times \sqrt{-1}$ were required, this would on the ſame principles be repreſented by $-\sqrt{-1}$; and the fourth power of $\sqrt{-1}$ is equal to $+1$; but with this limitation, that the root of this quantity can only be -1, and not ± 1: hence then we have $(\sqrt{-1})^2 = -1$, $(\sqrt{-1})^3 = -\sqrt{-1}$ and $(\sqrt{-1})^4 = 1$, $(\sqrt{-1})^5 = \sqrt{-1}$; and conſequently, the 6th power will be the ſame as the 2d; the 7th the ſame as the 3d; the 8th the ſame as the 4th, and ſo on.

And exactly the converſe of theſe rules muſt be obſerved in diviſion. Theſe examples involve all the caſes that can ariſe; for if the quantities to be multiplied or involved be $\sqrt{-a} \times \sqrt{-b}$, we have only to write theſe, $\sqrt{a} \, . \, \sqrt{-1} \times \sqrt{b} \, . \, \sqrt{-1} = -\sqrt{ab}$; and $(\sqrt{-a})^2 \times (\sqrt{-b})^2 = ab\,(\sqrt{-1})^2 = -ab$; this product may be put under a ſimpler form, $\sqrt{-a^2} \times \sqrt{-b^2} = a\sqrt{-1} \times b\sqrt{-1} = ab\,(\sqrt{-1})^2 = -ab$: this ſhews the neceſſity of always ſeparating the quantities into ſuch factors, that only -1 is found under the radical, for according to the common rules for the multiplication of ſurds, we ſhould have $\sqrt{-a^2} \times \sqrt{-b^2} = \sqrt{-a^2 \times -b^2}\ \sqrt{a^2 b^2} = ab$, which is a falſe reſult; but the error is explained from what is obſerved in the preceding paragraph; for we have no right in this caſe to aſſume $\sqrt{a^2 b^2} = ab$, becauſe we know its generation, and that it aroſe from the product of two negative ſigns, and therefore its root muſt neceſſarily be $-ab$, and not $\pm ab$.

Having thus eſtabliſhed rules for the multiplication, diviſion, and involution of imaginary quantities, we ſhall give an example, on which a well known trigonometrical formula is deduced from an imaginary expreſſion for the ſine and coſine of an angle.

Let a be an arc of a circle, of which the radius is unity, and let c be the number that has unity for its hyperbolic logarithm; then the ſine of the arc a, or ſin. $a = \frac{c^{a\sqrt{-1}} - c^{-a\sqrt{-1}}}{2\sqrt{-1}}$; and coſin. $a = \frac{c^{a\sqrt{-1}} + c^{-a\sqrt{-1}}}{2}$, which exponential and imaginary values of the ſine and coſine are well known to geometers; and the inveſtigation of them, according to the received arithmetic of impoſſible quantities, may be as follows. Let ſin. $a = z$, then $\dot{a} = \frac{\dot{z}}{\sqrt{(1 - z^2)}}$. To bring this fluxion to ſuch a form that its fluent may be found by logarithms, both numerator and denominator are to be multiplied by $\sqrt{-1}$, then $\dot{a} = \sqrt{-1} \times \frac{\dot{z}}{\sqrt{(1 - z^2)}}$; and (by form 6 Harm. Men.) $a = \sqrt{-1} \times \log. \frac{z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$. Hence $\frac{a}{\sqrt{-1}}$, or $1 \times \frac{a}{\sqrt{-1}} = \log. \frac{z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$, and becauſe 1 is the log. c; $c^{\frac{a}{\sqrt{-1}}} = \frac{z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$; therefore, if both parts of the fractional index of c be multiplied by $\sqrt{-1}$, $c^{-a\sqrt{-1}} = \frac{z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$. Again, if the arc a be conſidered as negative, its ſine becomes alſo negative, and therefore $-a = \sqrt{-1} \times \log. \frac{-z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$; or $-a\sqrt{-1} = -\log. \frac{-z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$; and $a\sqrt{-1} = \log. \frac{-z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$; whence alſo, $c^{a\sqrt{-1}} = \frac{-z + \sqrt{(z^2 - 1)}}{\sqrt{-1}}$. If from this equation the former be taken away, there remains $-\frac{2z}{\sqrt{-1}} = c^{a\sqrt{-1}} - c^{-a\sqrt{-1}}$; whence dividing by $2\sqrt{-1}$, we have $z =$ ſin. $a = \frac{c^{a\sqrt{-1}} - c^{-a\sqrt{-1}}}{2\sqrt{-1}}$; and by adding together the equations, a value of the coſines may be found in the ſame imaginary terms which were aſſigned above. Now by means of theſe expreſſions, many theorems may be demonſtrated; it may for example be ſhewn, that if a and b are any two arcs of a circle of which the radius is unity, then

$$\text{ſin. } a + \text{coſin. } b = \frac{\text{ſin. } a + b}{2} + \frac{\text{ſin. } a - b}{2}.$$

For ſin. $a = \frac{c^{a\sqrt{-1}} - c^{-a\sqrt{-1}}}{2\sqrt{-1}}$; and coſin. $b = \frac{c^{b\sqrt{-1}} + c^{-b\sqrt{-1}}}{2}$, therefore ſin. a + coſin. $b =$

$$\frac{c^{a+b \, . \, \sqrt{-1}} - c^{-a-b \, . \, \sqrt{-1}} + c^{a-b \, . \, \sqrt{-1}} - c^{b-a \, . \, \sqrt{-1}}}{4\sqrt{-1}}$$

$= \frac{\text{ſin. } a + b}{2} + \frac{\text{ſin. } a - b}{2}$; which is a well known formula, and it has been deduced by means of the imaginary expreſſions that we firſt found, and various other examples of a ſimilar nature might here be given.

This example, with ſeveral others, all tending to ſhew the utility of theſe imaginary expreſſions, may be ſeen in the paper of Mr. Playfair before referred to, after which, and many ingenious remarks on this ſubject, the profeſſor concludes his paper with the following obſervation: "Supported on ſo ſure a foundation, the arithmetic of impoſſible quantities will always be found a uſeful inſtrument in the diſcovery of truth, and may be of ſervice when a more rigid analyſis can hardly be applied; for this reaſon many reſearches concerning it, which in themſelves might be deemed abſurd, are yet not deſtitute of utility: M. Bernouilli has found, for example, that if r be the radius of a circle, the circumference equal $\frac{4 \log. \sqrt{-1}}{\sqrt{-1}} . r$; conſidered as a quadrature of the circle, this imaginary theorem is wholly inſignificant, and would deſervedly paſs for an abuſe of calculation; at the ſame time we learn from it, that if in any equation the quantity $\frac{\log. \sqrt{-1}}{\sqrt{-1}}$ enters, it may be made to diſappear by the ſubſtitution of a circular arc."

We have ſaid nothing in the foregoing paragraphs of a paper on the ſubject of imaginary quantities by M. Buëe, publiſhed in the Philoſophical Tranſactions for 1806, in which the author endeavours to ſhew, that imaginary quantities are ſigns of *perpendicularity*, a notion peculiar to himſelf; but there are other parts of the eſſay that diſplay very conſiderable ability and ingenuity, but of which our limits will not allow a particular deſcription.

IMAGINARY *Roots of an Equation*, are thoſe roots, or values of the unknown quantity in an equation, which contain ſome imaginary expreſſion. Thus the roots of the equation $y^2 - 10y + 26$, are $5 \pm \sqrt{-1}$; and the three roots of the cubic equation $x^3 - 1 = 0$, are $x = \frac{-1 + \sqrt{-3}}{2}$; $\frac{-1 - \sqrt{-3}}{2}$; and 1: of which the latter is the only poſſible value of x, the two former being imaginary or impoſſible. Sometimes the root of an equation may be repreſented by imaginary expreſſions, when it is in fact equal to a real quantity, as is the caſe in the ſolution of cubic equations of the irreducible form, according to the method of Cardan. Albert Girard was the firſt author who treated expreſsly on the imaginary roots of equations, and ſhewed that every equation has as many roots, either real or imaginary, as is denoted by the higheſt power of the index; ſee his "Inventions Nouvelles en l'Algebra." D'Alembert, in the Memoires of Berlin for 1746, firſt demonſtrated, that every imaginary expreſſion may be reduced to the form $a \sqrt{-1}$, or $b + a \sqrt{-1}$; and that the number of imaginary roots always enter in pairs, and conſequently every equation of an odd dimenſion muſt have at leaſt one real root, but an equation of an even degree may have all its roots impoſſible. Waring alſo, in his "Meditationes Algebraicæ," has treated largely on this head, ſee chapters 2 and 3 of that work; in which will be found many excellent obſervations on this ſubject, with rules for determining the number of imaginary or impoſſible roots in a given equation of any dimenſions.

The rule given by ſir I. Newton, in his Univerſal Arithmetic, for finding the number of impoſſible roots in an equation is as follows. Conſtitute a ſeries of fractions, whoſe denominators are the ſeries of natural numbers 1, 2, 3, 4, 5, &c. continued to the number repreſenting the index or exponent of the higheſt power of the equation, and their numerators the ſame ſeries of numbers, in the contrary order; and divide each of thoſe fractions by that next before it, and place the reſulting quotients over the intermediate terms of the equation; then under each of the intermediate terms; if its ſquare, when multiplied by the fraction over it, be greater than the terms on each ſide of it, place the ſign +; but if not, the ſign −; and under the firſt and laſt term place the ſign +; then will the equation have as many imaginary roots, as there are changes of the under written ſigns from + to −, and from − to +. Thus, for the equation $x^3 - 4x^2 + 4x - 6 = 0$, the ſeries of fractions is $\frac{3}{1}$, $\frac{2}{2}$, $\frac{1}{3}$; and the ſecond of theſe, divided by the firſt, gives $\frac{2}{6}$, or $\frac{1}{3}$; and the third, divided by the ſecond, is alſo $\frac{1}{3}$; hence theſe fractions placed over the intermediate terms will ſtand thus,

$$\left\{ \begin{array}{cccc} & \frac{1}{3} & \frac{1}{3} & \\ x^3 & -4x^2 & +4x & -6 \\ + & + & - & + \end{array} \right.$$

Now, becauſe the ſquare of the ſecond term multiplied by its ſuperſcribed fraction is $\frac{16}{3}x^2$, which is greater than $4x^2$, the product of the two adjacent terms, therefore the ſign + is ſet below the ſecond term; and becauſe the ſquare of the third term multiplied by its correſponding fraction is $\frac{16}{3}x^2$, which is leſs than $24x^2$, the product of the terms on each ſide of it, therefore the ſign − is placed under that term; alſo the ſign + is ſet under the firſt and laſt terms. Hence the two changes of the ſign, firſt from + to − 1, and then again from − to +, indicate that the given equation has two impoſſible roots.

When two or more of the terms are wanted together, under the place of the firſt of the different terms write the ſign −, under the ſecond the ſign +, under the third the ſign − 1, and ſo on, always varying the ſigns, except that under the laſt of the deficient terms, which muſt always be +, when the adjacent terms on both ſides of the deficient terms have contrary ſigns; as in the equation

$$\begin{array}{cccccc} x^5 & + ax^4 & + 0x^3 & + 0x^2 & + 0.x & + b = 0 \\ + & + & - & + & - & + \end{array}$$

which has four imaginary roots.

This rule, however, may ſometimes fail of giving the true number of impoſſible roots, on account of the roots being more than there can be changes of the ſign, but this ſeldom happens.

This rule is demonſtrated by Maclaurin, who has alſo given another of his own, which never fails; and the ſame has alſo been done by Mr. Campbell. See Philoſophical Tranſactions, vols. 34 and 35.

IMAGINARY *Root*. See ROOT.

IMAGINATION, as it has been often defined, is a power or faculty of the ſoul, whereby it conceives and forms ideas of things, by means of impreſſions made on the fibres of the brain, by ſenſation. This power depends on the memory. Ideas enter into the mind by the ſenſes; the memory retains them; and the imagination compounds them. Some writers have diſtinguiſhed two ſorts of imagination; the one, which conſiſts in retaining the ſimple impreſſion of objects, is called the *paſſive* imagination; the other arranges the images that are received, and combines them in a thouſand ways, and is called the *active* imagination. The organs of our ſenſes are compoſed of fibrillæ, or little fibres, which, at one end, terminate in the outward parts of the body and ſkin, and at the other in the middle of the brain. Theſe fibres may be moved two ways; either beginning at that end which terminates in the brain, or at that which terminates without. Now the agitation of theſe fibres cannot be communicated to the brain, but the ſoul will be affected, and perceive ſomething. If then the agitation begins where objects make their firſt impreſſion, *viz.* on the external ſurface of the fibres of our nerves, and is communicated thence to the brain; the ſoul, in that caſe, judges that what ſhe perceives is without, that is, ſhe percieves an external object as preſent; but if only the anterior fibres be moved by the courſe of the animal ſpirits, or in ſome other manner, the ſoul then imagines, and judges, that what ſhe perceives is not without, but within the brain; that is, ſhe perceives an object as abſent; and herein lies the difference between ſenſation and imagination.

The faculty of imagining, or imagination, only conſiſts, according to the doctrine of Malebranche, in the power which the ſoul has of forming images of objects, by producing a change in the fibres of that part of the brain, which may be called the principal part, becauſe it correſponds to all the parts of our body, and is the place where the ſoul (if it may be ſo ſaid) immediately reſides. It matters not which that part is, nor whether the opinion of Willis be true, who places the common ſenſe in the two bodies, called *corpora ſtriata*, and the imagination in the *corpus calloſum*; or that of Fernelius, who places ſenſation in the pia mater that encompaſſes the ſubſtance of the brain; or that of Deſcartes, who places it in the pineal gland: it ſuffices that there is ſome ſuch part.

Since then the imagination only conſiſts in a power which the ſoul has of forming images of objects, by impreſſing them on the fibres of the brain, it follows that the larger and more diſtinct the veſtigia or tracks of the animal ſpirits, which are the lines or ſtrokes, as it were, of thoſe images, are; the more ſtrongly and diſtinctly the ſoul imagines thoſe objects. Now as the breadth, depth, and cleanneſs of the ſtrokes of a ſculpture depend on the force wherewith the graver acts, and the obedience which the copper yields, ſo the depth and cleanneſs of the tracks of the imagination depend on the force of the animal ſpirits, and the conſtitution of the fibres of the brain; and it is that variety which is found in thoſe two things, to which we owe almoſt all the vaſt difference which we obſerve in people's minds. On the one ſide are abundance and ſcarcity, briſkneſs and ſlowneſs, largeneſs and ſmallneſs, of the animal ſpirits; and on the other hand, delicacy or groſſneſs, humidity or dryneſs, ſtiffneſs or flexibility of the fibres of the brain; and laſtly, a particular relation which the animal ſpirits may have with thoſe fibres: from the various combinations of which things, will reſult a ſufficiently great variety, to account for all the different characters which appear in the minds of men: and from the ſame principle flows that difference which is obſerved in the ſame perſon's mind, at different times, and under different circumſtances, as in childhood, manhood, and old age, in ſickneſs, health, &c.

It may here be obſerved, that the fibres of the brain are more agitated by the impreſſion of objects than by the courſe of the animal ſpirits; and for this reaſon the ſoul is more affected with objects, which it perceives by ſenſation, and which it looks on as preſent, and capable of giving it pleaſure or pain, than by thoſe perceived by imagination, which it judges to be diſtant. And yet it ſometimes happens, that in perſons whoſe animal ſpirits are extremely agitated by faſting, waking, drinking, a fever, or ſome violent paſſion, theſe ſpirits move the inward fibres of the brain as forcibly as inward objects do; ſo that theſe perſons perceive things by ſenſation, which they ſhould only perceive by imagination; for imagination and ſenſation only differ from each other, as the greater from the leſs. (See Malebranche, Recher. de la Verité, lib. ii. See MADNESS, DELIRIUM, PHRENSY, MELANCHOLY, &c.)

Imagination or fancy, ſays the ingenious Mr. Harris, though as to its origin it may be ſubſequent to ſenſe, yet is truly prior to it in dignity and uſe. It is this which retains the fleeting forms of things, when things themſelves are gone, and all ſenſation is at an end. The difference between ſenſe and imagination appears from hence; that we have an imagination of things that are gone and extinct, which cannot be made the objects of ſenſation. We have an eaſy command over the objects of our imagination; whereas our ſenſations are neceſſary, when their objects are preſent. Imagination is alſo diſtinguiſhed from memory, as the former views ſome relict of ſenſation repoſed within us, without thinking of its riſe, or referring it to any ſenſible object, whereas memory views ſuch relict, referring it at the ſame time to that ſenſible object, which in time paſt was its cauſe and original, and recollection is the road which leads to memory, through a ſeries of ideas, however connected, whether rationally or caſually. Beſides, imagination may exhibit, after a manner, things that are to come: but memory is confined in the ſtricteſt manner to the paſt. Hermes, p. 354, &c. ed. 2d.

Conception is frequently uſed as ſynonymous with imagination. Thus Dr. Reid ſays (Eſſays on the Intellectual Powers of Man, p. 397.) that "imagination, in its moſt proper ſenſe, ſignifies a lively conception of objects of ſight. This is a talent of importance to poets and orators, and deſerves a proper name, on account of its connection with their arts." He adds, that "imagination is diſtinguiſhed from conception, as a part from a whole." Profeſſor Stewart (in his Elements of the Philoſophy of the Human Mind, p. 135, 8vo.) diſtinguiſhes between conception and imagination. The buſineſs of conception, according to this ingenious writer, is to preſent us with an exact tranſcript of what we have felt or perceived. But we have, moreover, a power of modifying our conceptions, by combining the parts of different ones together, ſo as to form new wholes of our own creation. Accordingly he employs the word imagination to expreſs this power, which, in his opinion, is the proper ſenſe of the word; if imagination be the power which gives birth to the productions of the poet and the painter. This is not a ſimple faculty of the mind. It preſuppoſes abſtraction, to ſeparate from each other, qualities and circumſtances which have been perceived in conjunction; and alſo judgment and taſte to direct us in forming the combinations. The two powers of conception and imagination, though diſtinct, are very nearly allied; and are frequently ſo blended, that it is difficult to ſay, to which of the two ſome particular operations of the mind are to be referred. There are alſo many general facts which hold equally with reſpect to both. Logicians in general have maintained, that conception, or imagination, often uſed as ſynonymous with it, is attended with no belief of the exiſtence of its object. But this is a principle which profeſſor Stewart has controverted. (See CONCEPTION.) Imagination, according to Dr. Hartley, is the faculty to which we aſcribe the recurrence of ideas in a vivid manner, without regard to the order of paſt impreſſions. All ideas, he ſays, are the reſult either of new impreſſions, or of aſſociation with preceding ideas, though the connection cannot in every inſtance be immediately traced out. In that ſtate of mind denominated a reverie, a perſon is more attentive to his own thoughts than to external impreſſions, and therefore more of his ideas are deducible from aſſociation, and fewer from external impreſſions. And as dreams are the imaginations or reveries of a ſleeping man, theſe are deducible from impreſſions lately received, from the ſtate of the body, and particularly of the ſtomach and brain, and alſo from aſſociation. See DREAM.

Every man, ſays Dr. Reid, is conſcious of a ſucceſſion of thoughts, which paſs in his mind while he is awake, even when they are not excited by external objects; and this continued ſucceſſion of thought has, by modern philoſophers, been called the "imagination." It is often denominated the "train of ideas," and is made up of many other operations of mind, as well as conceptions or ideas. Memory, judgment, reaſoning, paſſions, affections, and purpoſes; in a word, every operation of the mind, excepting thoſe of ſenſe, is exerted occaſionally in this train of thought, and has its ſhare as an ingredient; ſo that we muſt take the word idea in a very extenſive ſenſe, if we make the train of our thoughts to be only a train of ideas. Theſe trains of thought in the mind are of two kinds: they are either ſuch as flow ſpontaneouſly, like water from a fountain, without any exertion of a governing principle to arrange them, or they are regulated and directed by an active effort of the mind with ſome view and intention. Theſe two kinds, however diſtinct in their nature, are for the moſt part mixed in perſons awake and arrived at years of underſtanding; and they take their denomination from that which is moſt prevalent. It is to be obſerved, however, that a train of thought, which at firſt was ſtudied and compoſed, may by habit preſent itſelf ſpontaneouſly. Thoſe trains of thought that are ſpontaneous muſt be the firſt in the order of nature. When the work of the day is over, and a man lies down to relax his body and mind, he cannot ceaſe from thinking, though he deſires it. Something occurs to his fancy; that is followed by another thing; and ſo his thoughts are carried from one object to another, till ſleep cloſes the ſcene. In this operation of the mind, it is not one faculty only that is employed. Though memory acts the moſt conſiderable part, other powers are exerciſed and directed to their proper objects. In reveries of this kind we judge and reaſon, form an opinion of perſons and things, and paſs ſentence accordingly. Such trains of thought may be called hiſtorical. Others may be denominated romantic, in which the plot is formed by the creative power of fancy, without any regard to what did or will happen. In theſe alſo, the powers of judgment, taſte, moral ſentiment, as well as the paſſions and affections, come in and take a ſhare in the execution. Mr. Addiſon, in the "Spectator," calls this play of the fancy "caſtle-building." The romantic ſcenes of fancy are moſt commonly the occupation of young minds, not yet ſo deeply engaged in life as to have their thoughts taken up by its real cares and buſineſs. In perſons come to maturity, there is even in theſe ſpontaneous ſallies of fancy ſome arrangement of thought. But how is this arrangement effected? It has all the marks of judgment and reaſon, yet it ſeems to go before judgment, and to ſpring forth ſpontaneouſly. It is highly probable, that whatever is regular and rational in a train of thought, which preſents itſelf ſpontaneouſly to a man's fancy, without any ſtudy, is a copy of what had been before compoſed, by his own rational powers, or thoſe of ſome other perſon. They are the reſult of habits previouſly acquired. In order to account for the regular arrangement of theſe operations of fancy that are in a great degree ſpontaneous, we need only recur to the natural powers of judgment and invention; the pleaſure that always attends the exerciſe of thoſe powers, the means we have of improving them by imitation of others, and the effect of practice and habits, without ſuppoſing any unaccountable attractions of ideas by which they arrange themſelves. Beſides the original powers which fancy poſſeſſes, which are very different in different perſons, it has likewiſe more regular motions, to which it has been trained by a long courſe of diſcipline and exerciſe; and by which it may *extempore*, and without much effort, produce things that have a conſiderable degree of beauty, regularity, and deſign. Upon the whole we may obſerve, that every thing that is regular in that train of thought, which we call fancy or imagination, from the little deſigns and reveries of children, to the grandeſt productions of human genius, was originally the offspring of judgment or taſte, applied with ſome effort greater or leſs. In order to account for this ſucceſſive train of thought in the mind, a theory, which was ſuggeſted by Mr. Hobbs, has been more diſtinctly explained by Mr. Hume. That author thinks, that the train of thought in the mind is owing to a kind of attraction which ideas have for other ideas that bear certain relations to them. The relations which produce this attraction of ideas, he thinks, are theſe three only, *viz.* cauſation, contiguity in time or place, and ſimilitude. Theſe, according to this writer, are the only general principles that unite ideas. Dr. Reid very juſtly obſerves, that this enumeration of the relations of things is very inaccurate. Lord Kames, in his "Elements of Criticiſm," and Dr. Gerard in his "Eſſay on Genius," have given a much fuller and juſter enumeration of the cauſes that influence our train of thinking. To theſe works we refer. After all, this attraction of ideas may be reſolved into the power of habit. As far as it is in our power to give a direction to our thoughts, which it undoubtedly is in a great degree, they will be directed by the principles common to men, by our appetites, our paſſions, our affections, our reaſon, our conſcience; and that the trains of thinking in our minds are chiefly governed by theſe, according as one or another prevails at the time, every man will find in his experience. We ſhall here ſubjoin two or three reflections of a more practical nature, and of higher importance. It muſt be allowed that our happineſs or miſery in life, that our improvement in any art or ſcience we profeſs, and that our improvement in real virtue and goodneſs, depend in a very great degree on the train of thinking that occupies the mind both in our vacant and in our more ſerious hours. "As far, therefore, as the direction of our thoughts is in our power (and that it is ſo in a great meaſure cannot be doubted), it is of the utmoſt importance to give them that direction which is moſt ſubſervient to thoſe valuable purpoſes. The human imagination is an ample theatre, upon which every thing in human life, good or bad, great or mean, laudable or baſe, is acted. How happy is that mind in which the light of real knowledge diſpels the phantoms of ſuperſtition; in which the belief and reverence of a perfect all-governing mind caſts out all fear, but the fear of acting wrong; in which ſerenity and cheerfulneſs, innocence, humanity, and candour, guard the imagination againſt the entrance of every unhallowed intruder, and invite more amiable and worthier gueſts to dwell! There ſhall the Muſes, the Graces, and the Virtues, fix their abode; for every thing that is great and worthy in human conduct muſt have been conceived in the imagination before it was brought in to act. And many great and good deſigns have been formed there, which, for want of power and opportunity, have proved abortive. The man, whoſe mind is occupied by theſe gueſts, muſt be wiſe; he muſt be good; and he muſt be happy." Reid's Eſſays on the Intellectual Powers of Man, Eſſ. iv.

Imagination, *Pleaſures of the*, are referred by Mr. Addiſon, in the ſixth volume of the "Spectator," to three ſources, *viz. beauty*, grandeur or *ſublimity*, and *novelty;* which ſee reſpectively. Theſe pleaſures, as the author deſcribes them, are ſuch as ariſe from viſible objects, either when we have them actually in view, or when we call up their ideas into our minds by paintings, ſtatues, deſcriptions, or any the like occaſion. Theſe pleaſures are not ſo groſs as thoſe of ſenſe, nor ſo refined as thoſe of the underſtanding. They are more conducive to health than thoſe of the underſtanding, which are wrought out by dint of thinking, and attended with too violent a labour of the brain. Delightful ſcenes, whether in nature, painting, or poetry, have a kindly influence on the body as well as the mind, and not only ſerve to clear and brighten the imagination, but are able to diſperſe grief and melancholy, and to ſet the animal ſpirits in pleaſing and agreeable motions. The Creator hath wonderfully diſplayed his benignity by endowing us with the powers of taſte and imagination for participating ſuch pleaſures; and the additional embelliſhment and glory, which, for promoting our entertainment, the Author of nature hath poured forth upon his works, is one ſtriking teſtimony, among many others, of benevolence and goodneſs. This thought, firſt ſuggeſted by Mr. Addiſon, Dr. Akenſide, in his "Poem on the Pleaſures of the Imagination," has happily purſued:

> "———— Not content
> With every food of life to nouriſh man,
> By kind illuſions of the wandering ſenſe,
> Thou mak'ſt all nature, Beauty to his eye,
> Or Muſic to his ear.——"

Imagination, *Influence of, on the corporeal Frame.* The influence of this faculty of the mind upon the conſtitution and operations of the body has been the ſubject of ſome diſcuſſion from very early times. But it is remarkable, that while philoſophers and phyſicians attributed to it a ſeries of phenomena, which a more accurate inveſtigation has ſhewn to ariſe from other cauſes; they at the ſame time overlooked, or rather aſcribed to different ſources, many other facts, which ſubſequent inquiry has proved to originate from the influence of the imagination. The principal operation of this faculty, acknowledged by the older phyſicians, was that of pregnant women upon the body of the child *in utero:* and this opinion, although it was long ago ſatisfactorily refuted by ſome philoſophical obſervers, (ſee Dr. Blondel's anſwer to the twelfth chapter of Dr. Turner's treatiſe on Diſeaſes of the Skin, and Lettres ſur le Pouvoir de l'Imagination des Femmes enceintes, Paris 1745,) has been maintained by many other writers of reputation, and is ſtill popularly current, if not received as an eſtabliſhed truth by the leſs enlightened part of the medical profeſſion. Nothing, however, we conceive, but the inveteracy of the prejudices of education, can account for the ſupport of a doctrine, which reaſon, experience, and anatomical ſcience concur to refute. On the other hand, the phenomena actually occaſioned by the operation of the imagination on the corporeal functions, are ſo numerous, and yet at times appear ſo extraordinary, that they merit a particular inveſtigation: for it is the conſequence only of inattention to the ſubject, and of the general appetite of mankind, eſpecially in ages of ignorance, for whatever is occult and myſterious, that the principle was not long ago eſtabliſhed, and the facts rendered familiar to all. Rational ſcience, built upon obſervation and experiment, has in a great meaſure baniſhed the notions of magic and witchcraft, even from the peaſantry; but it remained for the philoſophical minds of a Franklin, a Lavoiſier, &c. to propound the myſteries of Meſmer, and the other profeſſors of *animal magnetiſm*, at Paris, near the cloſe of the eighteenth century;—and for that of a Haygarth, to expoſe the rationale of *Perkiniſm* and the *metallic tractors*, in our own country, at the beginning of the nineteenth. (See Rapport des Commiſſaires chargés par le Roy de l'examen du Magnétiſme Animal, Paris 1784;—and a pamphlet, "On the Imagination as a Cauſe and as a Cure of Diſorders of the Body, exemplified by fictitious Tractors and epidemical Convulſions; by John Haygarth, M.D. &c." Bath, 1800.) In truth, the influence of the faculty of imagination over the functions of the body affords an explanation of numerous facts in the moral as well as phyſical hiſtory of man, which have been accounted for upon various occult principles; ſuch as diabolical or dæmoniacal poſſeſſion; the power of incantations and amulets; the miraculous influence of relics, images of ſaints, &c.; the operations aſcribed to ſome magnetic or electrical principle in nature; to the touch of kings, and of various gifted perſons; and many other circumſtances.

Before we purſue this intereſting inquiry, however, we ſhall diſmiſs the ſubject, ſo far as relates to the ſuppoſed operation of the imagination in pregnant women.

I. All the varieties of deformity and monſtroſity, as well as of cutaneous marks and blemiſhes of infants, were formerly aſcribed to the imagination of the mother dwelling upon ſome analogous object, or to her diſappointed longings for ſome particular article of food or drink. Hippocrates himſelf obſerves, that the deſire of a pregnant woman is capable of marking the tender infant with the thing deſired: and ſubſequently, the obſervations to this effect, and the number of hiſtories illuſtrative of it, have been ſo multiplied by authors of reputation, that the defenders of the doctrine ſtill appeal to experience, as deciſive in favour of the ancient and popular opinion; they conſider the matter as eſtabliſhed upon the evidence of indiſputable hiſtory. But to thoſe who are acquainted with the records of medicine, it is not neceſſary to ſtate, that they abound with ſo many extravagant and fabulous details, which have been collected and repeated with the utmoſt credulity, that to admit them as truths would require a renunciation of the beſt principles of modern ſcience. It is enough to peruſe the marvellous collections of Schenk and Marcellus Donatus, to be ſatisfied of this propoſition, as to the occurrences themſelves; but in reſpect to the cauſes of the phenomena, (which is a matter of difficult inveſtigation,) authority is of no weight, when placed in oppoſition to ſound anatomical and phyſiological principles.

The moſt common deformities, attributed to the influence of the mother's imagination, are ſpots, tubercles, &c. on the ſkin, moſt commonly of a red or purpliſh colour, which are ſuppoſed to reſemble different ſorts of fruit, ſuch as raſpberries, cherries, ſtrawberries, &c. or the ſtains of port-wine; and other ſpots covered with a downy hair, and compared to the ſkin of a mouſe, a mole, &c. Theſe appearances have been commonly aſcribed to the diſappointed longings of the female, during utero-geſtation, for the particular fruit, which is ſuppoſed to be impreſſed on the ſkin; or to ſome agitation of mind, occaſioned by theſe things being thrown at her, or certain animals jumping upon her. But many more extraordinary phenomena are on record. Among the caſes ſtated by Turner, we find an inſtance of an "infant's head pierced quite through by reaſon of an affright of the mother;" another of a child born with the leg broken or diſtorted, by the mother looking on a crucifix, and viewing the broken limbs of one of the malefactors by the ſide of Chriſt; of a child of ſir J. B. which was born wanting one hand, in conſequence of his lady being frightened, when pregnant, by the unexpected view of a beggar's ſtump arm upon her coach door; of another child, which, in conſequence of the mother being purſued by her huſband with a drawn ſword, threatening to cut her over the forehead, near the time of her delivery, was brought forth with a large wound on its forehead, from which a fatal hæmorrhagy took place; and of another infant, whoſe abdominal viſcera hung out all naked below the navel at birth, in conſequence of the mother having been compelled to witneſs the killing of a calf three months before parturition, at the opening of which ſhe felt an extraordinary motion in herſelf, when ſhe ſaw how the bowels came tumbling from the belly; not to mention inſtances of children born with the head of a cat, with a hairy ſkin and bear's claws, or of different colour from that of the parents, in conſequence of frights, or of the frequent contemplation of pictures of bears, or of negroes, &c. See Turner on Diſeaſes of the Skin, chap. xii.

Now, in all theſe inſtances, the impreſſions on the imagination are alleged to have occurred in the courſe, or even at an advanced period, of the pregnancy. Before this occurrence then, it is preſumed that the child *in utero* was of the natural and perfect form; that is, the infant, which is born with a large diſcolouration or protuberance on its ſkin, had, up to this period, a fair and ſmooth ſkin; that the child who is born with ſix toes, had, till then, only five; that the child, brought forth with one leg or one arm, had originally two; and the monſter produced with the head of a cat, had originally a natural human head, until the mother was frightened by the cat getting into her bed, when ſhe was "big with child" (Turner); and ſo on, with regard to every other preternatural appearance, whether it be an increaſe, decreaſe, or alteration of the parts of the body. It ſeems almoſt ſufficient barely to ſtate the matter in this light, in order to demonſtrate the abſurdity of the opinion. For ſurely it does not require a train of reaſoning or of experiment to prove, that neither man nor woman can, by the force of imagination, "add an inch to the ſtature," or take an inch from it, or transform any part of their bodies into the reſemblance of other animals, or of vegetables and fruit. It is not leſs clear, that no woman can, by an effort of imagination, form a child; and, if not a whole child, neither can ſhe add new parts to a child already completely formed, nor deſtroy any of the parts ſo formed, nor tranſmute any of thoſe parts into other forms of ſtructure. For example, let us take the inſtance of the lady, who, when advanced five or ſix months in her pregnancy, was ſo terrified by a beggar thruſting the ſtump of an amputated arm into her coach, that the child, of which ſhe was afterwards delivered, was born with the ſtump of an arm reſembling that of the beggar. Let us conſider what an operation muſt be performed to work this effect: a child at the term of five or ſix months is of conſiderable bulk, and the arm itſelf not ſmall. This arm, then, muſt drop off by the power of imagination: there muſt be no blood loſt to endanger the life of the child; and the wound muſt be healed before the birth. This might ſeem ſufficiently improbable: but, admitting that the limb could drop off by the force of fancy in the mother, it muſt ſtill remain in the uterus until the delivery; and the bones at leaſt could not putrify and waſte away, although the fleſh might. But it never was pretended that, in caſes of this nature, any part of the deficient limb was found by the midwife. And, what is a material point in the argument, the ſtumps of all ſuch imperfect limbs have a ſmooth and regular ſkin, which plainly indicates that they were from their firſt formation of the ſame figure: for had there been a wound, there would have been a ſcar; and ſcars are very diſtinguiſhable from ſound ſkin.

When we conſider the nature of the connection between the fœtus in utero and the mother, this view of the ſubject is ſtill farther confirmed. The infant is not one body with the mother, as ſome writers have aſſerted, any more than the plant is one ſubſtance with the earth, which nouriſhes it. (See Lettres ſur le Pouvoir de l'Imagination de Femmes enceintes, Paris, 1745.) There is no communication of nerves whatever between the mother and the child, nor is there any direct vaſcular communication: the infant has its own diſtinct circulation of blood, carried on by the action of its own heart and arteries, which laſt do not terminate in the veſſels of the mother, but in the veins of the child, which reconduct the blood to its heart: nor is there any direct communication of the veſſels of the mother with thoſe of the fœtus. (See Embryo.) This identity of the circulation and nervous ſyſtem of the fœtus renders it altogether inconceivable that the ſenſations, fears, or deſires of the mother ſhould be in any way communicated to it; or that any impreſſion on the imagination of the mother ſhould produce any changes in its ſtructure, or appearance. As it never happens, by any ſeries of fancies or paſſions, that the figure of the objects of them is traced upon the ſkin of the mother; ſo it is equally impoſſible, and more improbable, that ſuch changes or appearances ſhould be impreſſed upon the infant, thus inſulated from any nervous influence of the parent.

Beſides, with reſpect to the *nævi*, moles, and other marks on the ſkin, it is obvious to thoſe who have paid any attention to them, that the reſemblance which they are ſaid to bear to various ſorts of fruit, &c. is purely fanciful; that they are generally of two or three kinds, conſiſting of a multiplicity, or network, of ſmall blood-veſſels, which conſtitute the common red and purpliſh marks; or of large brown moles, &c.; and that the fancied occurrence of greater redneſs in thoſe of the former claſs, which are compared to fruit, at the time when ſuch fruit is ripe, ariſes merely from the increaſed circulation and diſtention of the ſmall blood-veſſels in hot weather. When theſe and other deformities are connate, the mother, already poſſeſſed with the belief that ſome ſuch cauſe as could affect the mind muſt have exiſted, is not long at a loſs; her memory or her prejudice ſoon furniſhes her with ſome fact, which was never attended to perhaps when it happened, and the inſtance of her child is added to the long catalogue of thoſe which preceded. For the minute accordance of the fact is never required. Thus there is no defect more common than that of a hare-lip; and when this appears, the mother does not fail to recollect, that at ſome time in the courſe of the nine months ſhe had wiſhed for a hare, or had been frightened by a hare, or had by chance ſeen ſomebody with a hare-lip, no matter which, the occurrence is ſatisfactorily accounted for, and the *fact* is eſtabliſhed. Yet had not medical obſervers given this *name* to the diſeaſe, the actual reſemblance of a human countenance, thus deformed, to that of a hare, would not perhaps readily ſuggeſt itſelf.

But, the truth is, although we cannot explain the cauſes of theſe irregularities and monſtroſities of human births, any more than various other anomalies and *luſus naturæ* in the animal and vegetable world in general, yet we muſt refer them all to the ſame origin: for in regard to his corporeal frame, his generation, and mechanical ſtructure, man is ſubject to the ſame laws with the reſt of the living creation. The growth of the human fœtus ſeems not to differ from the developement of the germ, in the eggs of oviparous animals, or in the ſeeds of plants. All theſe are liable to every conceivable variety of conformation; to deformities, redundancies, defects, and anomalous diſpoſitions of parts, both internal and external: yet the influence of imagination is, in the latter caſes, out of the queſtion. But it would ſeem, that a nut with two kernels, a chicken with two heads, or a child with a double head, body, and limbs, (a monſtroſity not very rare,) are upon a very ſimilar footing: and, that it would be as philoſophical to attribute the monſtrous chicken to the imagination of the hen that hatched the egg, or the double nut to the fancies of the hazle-buſh, as to aſcribe the extraordinary infant to the fears or apprehenſions of the mother.

In all the above examples, the changes, ſuppoſed to be effected by the imagination on the child in the womb, are ſaid to take place after the developement of the germ or embryo has conſiderably advanced; and it is to ſuch operations only that our attempts at refutation apply. For as to the myſterious influence of the mind in the act of procreation, on which "the *callipædia*, or the art of begetting beautiful children" depends, although much has been ſaid on the ſubject in all ages, we confeſs ourſelves altogether unable to enter into the diſcuſſion. The original conception may doubtleſs be modified by circumſtances, which are incapable of producing ſubſequent changes in the embryo. If the placing of ſtreaked or pilled rods before the flocks at the time of their conjunction, as mentioned in holy writ, (Gen. chap. xxx.) was the occaſion of the generation of black and white lambs; the notions of ſome ancient and modern philoſophers and poets may be verified in reſpect to the human conception. Thus the tyrant Dionyſius, who was deformed and ill-favoured himſelf, in order that he might have a comely iſſue, is ſaid to have always had a beautiful picture ſet before his wife in the bed-chamber, that by the force of fancy ſhe might conceive the likeneſs of it. Galen attributed the ſame effect to the ſight of a picture. (Lib. de Theriac. ad Piſon. c. 14.) And the poet Heſiod exhorts his friends not to ſet about the work of procreation after they return from funerals, leſt the ſorrowful idea be tranſmitted to the conception, and the tender fœtus marked with ſome frightful character.

Μή δ' ἀπὸ δυσφήμοιο τάφου ἀπονοστήσαντα,
Σπερμαίνειν γενεήν, ἀλλ' ἀθανάτων ἀπὸ δαιτός.
Heſ. Lib. ii. de Op. et Dieb.

Dr. Darwin has many ſpeculations upon this ſubject; but he refers all the influence to the imagination of the male parent, and denies the influence of that of the female, not only during the period of pregnancy, but at the moment of conception; and he thinks the *callipædia* is an art which may be taught: "but," he properly obſerves, "the manner of accompliſhing this cannot be unfolded with ſufficient delicacy for the public eye." See Zoonomia, vol. i. ſect. xxxix. 6 and 7.

II. Although, however, we may be convinced of the error of aſcribing the actual changes of ſtructure, which conſtitute the deformities and monſtroſities of infants, to the imagination of the mother, operating upon the embryo after it is completely developed; yet we have the moſt ſatisfactory evidence of the powerful influence of this faculty over the nervous and vaſcular ſyſtem, and of effects reſulting from this influence, which might *à priori* be deemed equally extraordinary, as the metamorphoſes abovementioned. Who, for example, could ſuppoſe that, on the one hand, many painful, ſpaſmodic, and convulſive affections, both local and general, could be removed by impreſſions exciting only the imagination of the patient; or, that on the other hand, various anomalous ſenſations, actual ſyncope or ſwooning; and even the moſt violent epileptic and hyſterical convulſions, could be occaſioned by influencing the ſame faculty? We conceive, however, that no fact in phyſiology is more clearly demonſtrated. We ſhall firſt ſtate the evidence which experiment has eſtabliſhed, and then the inferences which may be deduced, and extended to many other analogous phenomena. The moſt ſtriking illuſtration is to be found in the hiſtory of

§ 1. *Animal Magnetiſm.*—In conſequence of the extent to which the practice of *animal magnetiſm*, as it was called by its inventor, M. Meſmer, was carried in Paris, the French king appointed a committee, conſiſting of four phyſicians, and five members of the Royal Academy of Sciences, to inveſtigate the matter, in the year 1784. Among the latter were M.M. Bailly, Lavoiſier, and Dr. Franklin, who was at that time the American miniſter at Paris. This agent, which Meſmer pretended to have diſcovered, he affirmed, was "a fluid univerſally diffuſed, and filling all ſpace, being the medium of a reciprocal influence between the celeſtial bodies, the earth, and living beings;—it inſinuated itſelf into the ſubſtance of the nerves, upon which therefore it had a direct operation;—it was capable of being communicated from one body to other bodies, both animated and inanimate, and that at a conſiderable diſtance, without the aſſiſtance of any intermediate ſubſtance;—and it exhibited in the human body ſome properties analogous to thoſe of the loadſtone, eſpecially its two poles. This *animal magnetiſm*," he added, "was capable of curing directly all the diſorders of the nervous ſyſtem, and indirectly other maladies; it rendered perfect the operation of medicines; and excited and directed the ſalutary *criſes* of diſeaſes, ſo that it placed theſe *criſes* in the power of the phyſician. Moreover, it enabled him to aſcertain the ſtate of health of each individual, and to form a correct judgment as to the origin, nature, and progreſs of the moſt complicated diſeaſes, &c." In ſhort, he ſaid, "La Nature offre dans le magnétiſme un moyen univerſel de guerir et de preſerver les hommes." (See Memoire ſur la Decouverte du Magnetiſme Animal, par M. Meſmer, Doct. en Med. de la Faculté de Vienne, 1779.—Alſo his Precis Hiſtorique des Faits relatifs aux Mag. An. juſques en Avril, 1781.) Monſ. Deſlon, a pupil of Meſmer, alſo practiſed animal magnetiſm at Paris, and undertook to demonſtrate its exiſtence and properties to the commiſſioners. He commenced his inſtructions by reading a memoir, in which he maintained, that "there is but one nature, one diſeaſe, and one remedy; and that remedy is animal magnetiſm."

The firſt ſtep of the commiſſioners was to examine the mode and inſtruments of operation, and the effects of the agent. It was obſerved that M. Deſlon operated upon many individuals at the ſame time. In the middle of a large room was placed a circular cheſt of oak, raiſed about a foot from the floor, which was called the *baquet:* the lid of this cheſt was pierced with a number of holes, through which there iſſued moveable and curved branches of iron. The patients were ranged in ſeveral circles round the cheſt, each at an iron branch, which, by means of its curvature, could be applied directly to the diſeaſed part. A cord, which was paſſed round their bodies, connected them with one another; and ſometimes a ſecond chain of communication was formed by means of the hands, the thumb of each one's left hand being received and preſſed between the fore-finger and thumb of the right hand of his neighbour. Moreover, a *piano-forte* was placed in a corner of the room, on which different airs were played; ſound being, according to the principles of Meſmer, a conductor of magnetiſm. The patients, thus ranged in great numbers round the *baquet*, received the magnetic influence at once by all theſe means of communication; by the branches of iron which tranſmitted to them the magnetiſm of the baquet; by the cord entwined round the body; by the union of thumbs, which conveyed to each the magnetiſm of his neighbour; and by the ſound of the muſic, or of an agreeable voice, which diffuſed the principle through the air. The patients were, beſides, directly magnetiſed, by means of the finger of the magnetiſer, and a rod of iron, which he moved about before the face, above or behind the head, and over the diſeaſed parts, always obſerving the diſtinction of the magnetic poles, and fixing his countenance upon the individual. But above all, they were magnetiſed by the application of the hands, and by preſſure with the fingers upon the hypochondria, and the abdominal regions, which was often continued for a long time, occaſionally for ſeveral hours together.

The patients, ſubjected to this treatment, at length began to preſent very various appearances in their condition, as the operation proceeded. Some of them were calm and tranquil, and felt nothing; others were affected with coughing and ſpitting; others again experienced ſlight pains, partial or univerſal heats, and conſiderable perſpirations; and others were agitated and tortured with convulſions. Theſe convulſions were extraordinary in their number, ſeverity, and duration. The commiſſioners ſaw them, in ſome inſtances, continue for three hours, when they were accompanied with expectoration of a viſcid phlegm, which was ejected by violent efforts, and ſometimes ſtreaked with blood; one young man often brought up blood copiouſly. The convulſions were characterized by violent involuntary motions of the limbs, and of the whole body, by ſpaſms of the throat, by agitations of the epigaſtrium and hypochondres, and wandering motions of the eyes, accompanied by piercing ſhrieks, weeping, immoderate laughter, and hiccup. They were generally preceded or followed by a ſtate of languor and rambling, or a degree of drowſineſs and even of coma. The leaſt unexpected noiſe made the patients ſtart; and it was remarked, that even a change of meaſure in the air, played upon the piano-forte, affected them, ſo that a more lively movement increaſed their agitation, and renewed the violence of their convulſions. Nothing can be more ſurpriſing, or more inconceivable by thoſe who have not witneſſed it, than the ſpectacle of theſe convulſions, ſay the commiſſioners: all ſeem to be under the power of the magnetiſer; a ſign from him, his voice, his look, immediately rouſes them from a ſtate even of apparent ſopor. In truth, they add, it was impoſſible not to recogniſe, in theſe conſtant effects, a great power or agency, which held the patients under its dominion, and of which the magnetiſer appeared to be the ſole depoſitary. See Rapport des Commiſſaires chargés par le Roi, de l'Examen du Magnétiſme Animal; à Paris, 1784.

Such, then, were the phenomena (of the reality of which they could not doubt) produced by the operation of this new agent, the nature and origin of which it was the duty of the commiſſioners to inveſtigate. This convulſive and lethargic ſtate, it may be noticed, was conſidered as a *criſis*, ſuch as the conſtitution or the art of medicine is enabled to effect, for the purpoſe of curing diſeaſes; and for the ſake of brevity, we ſhall adopt the term, to expreſs this occurrence, regardleſs of the hypotheſis which led to its uſe.

On witneſſing the ſame experiments, frequently repeated, the commiſſioners remarked, that among the patients who fell into the *criſis*, there were always many women, and very few men; that the *criſes* were not effected in leſs than the ſpace of an hour or two; and that as ſoon as one perſon was thus taken, the reſt were ſimilarly ſeized in a very ſhort time. But they were unable to obtain any ſatisfactory reſults from experiments made upon ſo many perſons at once. They reſolved, therefore, to endeavour, by experiments upon individuals, in a more private way, to aſcertain the direct effects of the newly diſcovered agent on the animal economy, in a ſtate of health; which, if the agent exiſted, could of courſe be rendered manifeſt by its effects: and they determined to become themſelves the ſubjects of the firſt experiments. No inquiry was ever conducted in a more philoſophical manner, or terminated in a more complete and unequivocal developement of the nature of the ſubject. Great and extraordinary as the powers of this new agent ſeemed to be, the phenomena were proved to be referrible ſolely to the *imagination* of the parties magnetiſed.

The commiſſioners ſubmitted to be magnetiſed together, excluding all ſtrangers, by M. Deſlon, once a week, for the ſpace of two hours and a half: they were ranged round the *baquet*, encircled by the cord of communication, with an iron branch from the *baquet* reſting upon the left hypochondre of each, and forming from time to time the communication of thumbs: they were magnetiſed by the fingers or the metallic rod being moved about and preſented to different parts of the body, as well as by the preſſure of hands on the pit of the ſtomach and ſides of the belly. The moſt irritable and delicate of the commiſſioners were magnetiſed the moſt frequently, and for the longeſt time. But none of them experienced any effects or ſenſations; or at leaſt any that could be aſcribed to magnetiſm. Three of them were valetudinarians, and ſome of their uſual uneaſy feelings were excited partly by the fatigue, and partly by the ſtrong preſſure made on the ſtomach. They ſubmitted to the experiment on three days ſucceſſively: ſtill without any effect. The quiet and ſilence of the eight commiſſioners, thus magnetiſed, without any uneaſineſs or any new ſenſation, formed the moſt perfect contraſt with the noiſe, agitation, and diſorder of the public magnetiſm: here was the magnet without any influence, and the operator deſpoiled of his power. They were warranted, therefore, in concluding, "that magnetiſm has no agency in a ſtate of health, or even in a ſtate of ſlight indiſpoſition.'

They reſolved, then, to make their next trials of its influence upon perſons actually diſeaſed; and ſeven perſons, of the lower claſs, were magnetiſed by M. Deſlon, in the preſence of the commiſſioners, at Dr. Franklin's houſe. Two women, the one aſthmatic, the other with a ſwelling on the thigh, and two children, the one ſix and the other nine years of age, felt nothing, and remained unaffected. One man, with diſeaſed eyes, felt a pain in the ball of one of them, which alſo diſcharged tears, when the finger of the magnetiſer was brought near it, and moved quickly about for a conſiderable time: but when the other eye, which was moſt diſeaſed, was magnetiſed, he felt nothing. A nervous, hyſterical woman, to whom the preſſure of the abdomen was painful, and who had a *hernia*, ſaid ſhe felt a pain in the head when the finger was pointed near the rupture, and that ſhe loſt her breath when it was brought oppoſite the face. When the finger of the magnetiſer was repeatedly moved up and down, ſhe experienced ſome catchings of the muſcles of the head and ſhoulders, like one ſurpriſed and afraid. The ſeventh patient, a man, ſuffered ſome effects of the ſame ſort, but much leſs marked.

Four perſons, two ladies and two gentlemen, of good education, and in bad health, were afterwards magnetiſed. Three of theſe underwent the operation ſeveral times, and felt nothing: but the fourth, a nervous lady, being magnetiſed during an hour and twenty minutes, generally by the application of the hands, was ſeveral times on the point of falling aſleep, and felt ſome degree of agitation and uneaſineſs. On a ſubſequent occaſion, a large company, aſſembled at Dr. Franklin's, (who was confined by illneſs,) were all magnetiſed, including ſome patients of M. Deſlon, who had accompanied him thither: there were preſent ſeveral Americans, one of whom, an officer, had an intermittent fever; yet no perſon experienced any effects, except M. Deſlon's patients, who felt the ſame ſenſations to which they had been accuſtomed at his public magnetiſing.

Theſe experiments, then, furniſhed ſome important facts. Of fourteen invalids, five experienced ſome effects from the operation, but nine felt none whatever. All the effects obſerved in the nervous lady, however, might be occaſioned by the irkſomeneſs of the ſame poſture for ſo long a time, and by her attention being ſtrongly fixed upon her feelings: for it is frequently ſufficient to think of theſe nervous attacks, or to hear them mentioned, in order to reproduce them when they are habitual. The three other inſtances occurred among perſons of the *lower claſs*: and this circumſtance was remarked with ſurpriſe by the commiſſioners; that the only effects, which could be aſcribed to magnetiſm, manifeſted themſelves in the poor and ignorant; while thoſe who were better able to obſerve and to deſcribe their ſenſations, felt nothing. At the ſame time, it was obſerved, that *children*, although endowed with the peculiar ſenſibility of their age, likewiſe experienced no effect. The notion, that theſe effects might be explained by natural cauſes, therefore, ſuggeſted itſelf to the commiſſioners. "If we figure to ourſelves," they obſerve, "a poor ignorant perſon, ſuffering from diſeaſe, and anxious to be relieved, brought before a large company, partly conſiſting of phyſicians, with ſome degree of preparation and ceremony, and ſubjected to a novel and myſterious treatment, the wonderful effects of which he is already perſuaded that he is about to experience; and if, moreover, it is recollected, that he is paid for his compliance, and ſuppoſes that the experimenters will be gratified in being told that he perceived certain operations; we ſhall have natural cauſes by which theſe effects may be explained, or at leaſt very legitimate reaſons for doubting that the real cauſe is magnetiſm." Rapport des Commiſſ. p. 30.

Since the ſuppoſed effects of the *animal magnetiſm*, then, were not diſcoverable in thoſe who were incredulous; there was great reaſon to ſuſpect, that the impreſſions which were produced, were the reſult of a previous expectation of the mind, a mere effect of the *imagination*. The commiſſioners, therefore, now directed their experiments to a new point; namely, to determine how far the imagination could influence the ſenſations, and whether it could be the ſource of all the phenomena attributed to magnetiſm.

The commiſſioners had recourſe now to a M. Jumelin, who magnetiſed in the ſame way with M. M. Meſmer and Deſlon, except that he made no diſtinction of the magnetic *poles*. Eight men and two women were operated on by M. Jumelin; but none of them experienced any effect. At length a female ſervant of Dr. Le Roy, who was magnetiſed in the forehead, but without being touched, ſaid ſhe perceived a ſenſe of heat there. When M. Jumelin moved his hand about, and preſented the extremities of his five fingers to her face, ſhe ſaid that ſhe felt as it were a flame moving about: when magnetiſed at the ſtomach, ſhe declared that the heat was there; at the back, and the ſame heat was there: ſhe then affirmed that ſhe was hot all over the body, and ſuffered a head-ache. Seeing that only one perſon, out of eleven, had been ſenſible of the magnetiſm, the commiſſioners thought that this perſon was probably poſſeſſed of the moſt mobile imagination. They therefore tied a bandage over her eyes, and ſhe was magnetiſed again: but the effects no longer accorded with the parts to which the magnetiſm was directed! When it was applied ſucceſſively to the ſtomach and to the back, the woman only perceived the heat in her head, and a pain in her eyes, and in the left ear! The bandage was removed, and M. Jumelin applied his hands to the hypochondres; ſhe immediately perceived a ſenſe of heat in thoſe parts; and, at the end of a few minutes, ſaid that ſhe was faint, and actually ſwooned. When ſhe was ſufficiently recovered, her eyes were again bandaged; M. Jumelin was then removed to a diſtance, ſilence was commanded, and they made the woman believe that ſhe was again magnetiſed. The effects were now preciſely the ſame, although no one operated, either near her or at a diſtance: ſhe felt the ſame heat, particularly in the back and loins, and the ſame pain in the eyes and ears! At the end of a quarter of an hour, a ſign was made to M. Jumelin to magnetiſe her at the ſtomach; he did ſo, but ſhe felt nothing; he magnetiſed her back, but without effect; in fact the heat of the back and loins gradually ceaſed, and the pains in the head remained!

Here, then, was demonſtrative evidence of the operation of the imagination. When the woman ſaw what was done, the ſenſations were placed in the parts magnetiſed; but when ſhe could no longer ſee, they were referred to the moſt diſtant parts, where no magnetiſm was directed; and, above all, they were equally felt, when ſhe was not magnetiſed at all, and not felt when ſhe was magnetiſed, after a little repoſe, but unknown to herſelf. The fainting of a nervous woman, when made the ſubject of a myſterious experiment, and continued in a poſture of reſtraint for a conſiderable time, is explicable upon natural cauſes. This experiment alſo ſhewed, that the diſtinction of poles was purely chimerical. It was repeated the following day upon a man and a woman, with the ſame reſults. Senſations, felt when they were not magnetiſed, could only be the effect of imagination: and it was found only neceſſary to excite and direct the imagination, by queſtions, to the parts where the ſenſations were to be felt, inſtead of directing the magnetiſm upon thoſe parts, in order to produce all the effects. A child of five years old was then magnetiſed; but it felt nothing, except the heat which it had previouſly contracted in playing.

Theſe experiments were repeated by the commiſſioners in various ways, upon many different perſons, of all claſſes, and with the ſame reſults, differing only according to the difference of ſuſceptibility of the imagination of the individuals. They found effects conſtantly experienced, when no magnetiſm was uſed, and *vice verſâ*, (when the eyes were covered,) according to the direction of the patient's attention by queſtions put to him with addreſs. Now this practice could not lead to any error; ſince it only deceived their imagination. For, in truth, when they were not magnetiſed, their only anſwer ought to have been, that they felt nothing.

Some facts, communicated to the commiſſioners by M. Sigault, an eminent phyſician at Paris, place the power of the imagination in a ſtrong light. "Having announced," he ſays, "in a great houſe, that I was an adept in the art of Meſmer, I produced conſiderable effects upon a lady who was there. The voice and ſerious air which I affected, made an impreſſion upon her, which ſhe at firſt attempted to conceal; but having carried my hand to the region of the heart, I found it palpitating. Her ſtate of oppreſſion indicated alſo a tightneſs in the cheſt, and ſeveral other ſymptoms ſpeedily enſued: the muſcles of the face were affected with convulſive twitches, and the eyes rolled; ſhe fell down in a fainting fit, vomited her dinner, and had afterwards ſeveral motions from the bowels, and felt herſelf in a ſtate of incredible weakneſs and languor. A celebrated artiſt, who gives leſſons in drawing to the children of one of our princes, complained during ſeveral days of a ſevere head-ache, which he mentioned to me when we met accidentally on the Pont-Royal. Having perſuaded him that I was initiated in the myſteries of Meſmer, almoſt immediately, by means of a few geſtures, I removed his pain, to his great aſtoniſhment." Dr. Sigault juſtly remarks, that it is probably by ſuch an impreſſion on the mind, that the ſight of the dentiſt removes the tooth-ache, when the patient has gone to him for the purpoſe of having his tooth drawn. He adds, that being one day in the parlour at a convent, a young lady ſaid to him, "you go to M. Meſmer's, I hear." 'Yes,' he replied, 'and I can magnetiſe you through the grate;' preſenting his finger towards her at the ſame time. She was alarmed, grew faint, and begged him to deſiſt; and, in fact, her emotion was ſo great, that had he perſiſted, he had no doubt that ſhe would have been ſeized with a fit. Rapport, *note* p. 39—41.

But although the commiſſioners were convinced, by their experiments, that the *imagination* was capable of producing different ſenſations, of occaſioning pain, and a ſenſe of heat, and even actual heat, in all parts of the body; and therefore that it contributed much to the effects, which were aſcribed to *animal magnetiſm*: yet the effects of the latter had been much more conſiderable, and the derangements of the animal economy, which it excited, much more ſevere. It was now, therefore, to be aſcertained, whether by influencing the imagination, convulſions, or the complete *criſis* witneſſed at the public treatment, could be produced. In proof of this point, their experiments were not leſs concluſive, as the following relation of one or two of them will evince. As M. Deſlon acknowledged that the complete ſucceſs of the experiments would depend upon the ſubjects of them being endowed with ſufficient ſenſibility, he was requeſted to ſelect ſome of his patients, who had already proved their ſuſceptibility of the magnetic influence, upon whom the trials might be made.

According to the principles of the magnetiſers, when a tree had been touched by them, and charged with magnetiſm, every perſon who ſtopped near the tree would feel the effects of this agent, and either fall into a ſwoon or into convulſions. Accordingly in Dr. Franklin's garden at Paſſy, an apricot tree was ſelected, which ſtood ſufficiently diſtant from the others, and was well adapted for retaining the magnetiſm communicated to it. M. Deſlon, having brought thither a young patient of twelve years of age, was ſhewn the tree, which he magnetiſed, while the patient remained in the houſe, under the obſervation of another perſon. It was wiſhed that M. Deſlon ſhould be abſent during the experiment; but he affirmed that it might fail, if he did not direct his looks and his cane towards the tree. The young man was then brought out, with a bandage over his eyes, and ſucceſſively led to four trees, which were *not magnetiſed,* and was directed to embrace each during two minutes; M. Deſlon at the ſame time ſtanding at a conſiderable diſtance, and pointing his cane to the tree actually magnetiſed. At the firſt tree, the young patient, on being queſtioned, declared that he ſweated profuſely; he coughed and expectorated, and ſaid that he felt a pain in the head: he was ſtill about twenty-ſeven feet from the magnetiſed tree. At the ſecond tree he found himſelf giddy, with the head-ache as before: he was now thirty feet from the magnetiſed tree. At the third, the giddineſs and head-ache were much increaſed; he ſaid he believed he was approaching the magnetiſed tree; but he was ſtill twenty-eight feet from it. At length, when brought to the fourth tree, *not magnetiſed,* and at the diſtance of twenty-four feet from that which was, the *criſis* came on; the young man fell down in a ſtate of inſenſibility, his limbs became rigid, he was carried to a graſs-plot, where M. Deſlon went to his aſſiſtance, and recovered him.

This experiment, then, was altogether adverſe to the principle of magnetiſm, not negatively, but poſitively and directly. If the patient, ſaid the commiſſioners, had experienced no effect under the tree actually magnetiſed, it might have been ſuppoſed that he was not in a ſtate of ſufficient ſuſceptibility; but he fell into the *criſis* under one which was not magnetiſed; therefore not from any external phyſical cauſe, but ſolely from the influence of the *imagination.* He knew that he was to be carried to the magnetiſed tree; his imagination was rouſed, and ſucceſſively exalted, until, at the fourth tree, it had riſen to the pitch neceſſary to bring on the *criſis.*

Many other experiments furniſhed the ſame reſults. M. Deſlon was requeſted to ſelect, from among his poor patients, thoſe who had ſhewn the greateſt ſenſibility to the magnetiſm; and he accordingly brought two women to Paſſy. While he was magnetiſing Dr. Franklin and ſeveral perſons in another apartment, the two women were put into ſeparate rooms. Three of the commiſſioners remained with one of the women, the firſt to queſtion her, the ſecond to write, and the third to repreſent M. Deſlon, who (they perſuaded her, after having bandaged her eyes) was brought into the room to magnetiſe her. One of them pretended to ſpeak to M. Deſlon, requeſting him to begin: but *nothing was done;* the commiſſioners remained quiet, only obſerving the woman. In the ſpace of three minutes, ſhe began to feel a nervous ſhivering (friſſon nerveux); then ſhe felt in ſucceſſion a pain in the head and in the arms, and a pricking in the hands, ſhe became ſtiff, ſtruck her hands together, got up from her ſeat, and ſtamped with her feet: in a word, the criſis was completely characterized. Two of the commiſſioners were in an adjoining room with the other woman, whom they placed by the door, which was ſhut, with her ſight at liberty, and made her believe that M. Deſlon was on the other ſide of the door, magnetiſing her. She had ſcarcely been ſeated a minute before the door when a ſhivering began; in one minute more ſhe had a clattering of the teeth, but yet a general warmth over the body; and, by the end of three minutes, the *criſis* was complete. The breathing became hurried; ſhe ſtretched out her arms behind her back, writhing them ſtrongly, and bending the body forwards; a general tremor of the whole body came on; the clattering of the teeth was ſo loud as to be heard out of the room; and ſhe bit her hand ſo as to leave the marks of her teeth in it.

Now, the commiſſioners obſerve, theſe two women were never touched, not even their pulſe felt. A more clear and demonſtrative proof of the power and agency of the imagination could not have been afforded them. It may be added, however, that one of theſe women, being ſent to M. Lavoiſier's, actually fell into the *criſis* in the antichamber, before ſhe had ſeen either M. Deſlon, or any of the commiſſioners; but ſhe knew that ſhe was to meet them there. While ſhe was alone in the antichamber, a ſhort time afterwards, different perſons went to her who had no connection with magnetiſm, and the convulſive motions began again. They remarked to her that no one magnetiſed her; but ſo much was her imagination excited, that ſhe replied, "If you did nothing to me I ſhould not be in this condition." She knew in fact that ſhe came there for the purpoſe of being the ſubject of experiment, and the approach of any one, or the leaſt noiſe, attracted her attention, recalled the idea of magnetiſm, and produced a freſh acceſſion of convulſions.

It is unneceſſary to carry this detail of facts any farther. No experimental inquiry could have been more ably proſecuted, and no philoſophical truth more clearly developed, than that the mere operation of the imagination is ſufficient to produce all thoſe great and extraordinary changes in the animal economy, which were aſcribed to an hypothetical agent in nature, which was termed magnetiſm. If, indeed, it ſhould be ſtill maintained, that the effects, produced in theſe iſolated experiments, fell ſhort of the phenomena which occurred at the *public* magnetiſings, there is another principle of the human conſtitution, which will fully account for this difference in the degree, independently of other phyſical circumſtances neceſſarily exiſting in the latter mode of treatment; we mean the principle of *imitation,* as it has been termed, of which we ſhall ſay more under its proper head. (See IMITATION.) Independently of the warmth and contamination of the air, in a crowded room, which particularly affects the head and the nervous ſyſtem, and of the influence of muſic in increaſing all emotions, and in addition to the multiplied impreſſions upon the ſight and hearing, as well as thoſe of touch and preſſure, not employed in the private trials, this principle of *imitation,* which heightens all emotions, and augments all tendencies to action, would be ſufficient to explain the difference. It was remarked that when one perſon fell into the *criſis,* the reſt were ſpeedily overcome. In like manner, we ſee a ſort of contagion in all the emotions and impreſſions excited in a crowded aſſembly. Hence the powerful impreſſions made by public ſpectacles, and the enthuſiaſm excited in theatres by generous ſentiments; hence the general ardour which ſpreads at once through an army in the hour of battle; or, on the contrary, the univerſal panic which is propagated with inconceivable rapidity, often from the ſlighteſt cauſes, or from cauſes merely imaginary; and hence alſo the ungovernable fury of mobs. But to trace the principle to a cloſer analogy, all nervous and convulſive diſeaſes are liable to propagate themſelves among thoſe who witneſs them, and thus to become, as it were, epidemic; whence hyſterical and epileptical convulſions have prevailed at times in large ſchools, manufactories, and even in religious aſſemblies, in a moſt diſtreſſing manner, and were prevented only by a complete ſeparation of the individuals, or by exciting ſtrong counter-impreſſions on the mind, ſuch as the dread of puniſhment, &c. (See IMITATION.) The greater effects, therefore, produced at the public operations of the magnetiſers, are explicable upon the known principles of the human conſtitution, and ſerve to confirm, rather than to invalidate, the inferences of the preceding inveſtigation.

§ 2. *Metallic Tractors.*—Complete as the detection of the deluſion of Meſmer, and the other advocates of *animal magnetiſm,* by the commiſſioners of Paris, was, and numerous as the facts were, which evinced the efficacy of touching, or even pointing at the body with the fingers, or a rod of iron, &c. in removing as well as in exciting pains and diſtreſſing ſenſations, it could hardly have been expected that another deluſion, founded upon the ſame grounds, could again be diſſeminated, after the ſhort interval of ſixteen or ſeventeen years, ſo as to find advocates among philoſophical men, and to enrich the author of the contrivance. Such, however, was the fact. We now ſtate it, rather as a matter of record than of information, that, in the year 1798, an American, of the name of *Perkins*, introduced into this country a method of curing diſeaſes, for which he obtained the royal letters patent, by means of two ſmall pieces of metal, denominated *Tractors*. Theſe were applied externally near the part diſeaſed, and moved about, gently touching the ſurface only; and thus multitudes of painful diſorders were removed, ſome moſt ſpeedily, and ſome after repeated applications of the metallic points. Pamphlets were publiſhed, announcing the wonderful cures accompliſhed by this ſimple remedy; and periodical journals and newſpapers teemed with evidence of the curative powers of the *tractors;* inſomuch, that in the courſe of a few months, they were the ſubject of general converſation, and ſcarcely leſs general uſe. The religious ſect of the Quakers, whoſe benevolence has been ſometimes diſplayed at the expence of their ſagacity, became the avowed and active friends of the *tractors;* and a public eſtabliſhment, called the "Perkinean Inſtitution," was formed under their auſpices, for the purpoſe of curing the diſeaſes of the poor, without the expence of drugs or medical advice. The tranſactions of this inſtitution were publiſhed in pamphlets, in ſupport of the extraordinary efficacy of theſe new inſtruments. In ſomewhat leſs than ſix years Perkins left the country, in poſſeſſion, as we have been informed on good authority, of upwards of ten thouſand pounds, the contributions of Britiſh credulity; and now (1811) the tractors are almoſt forgotten.

We by no means intend to impeach the veracity of thoſe who atteſted the many extraordinary cures performed by the application of the *tractors;* on the contrary, we have no doubt that many of them were actually accompliſhed, at leaſt temporarily: after what we have already ſtated, when treating of *animal magnetiſm*, (ſuch as the ſudden cure of the artiſt's head-ache, on the bridge, by M. Sigault's geſtures,) and what we ſhall proceed to ſtate reſpecting the effects of *counterfeit* tractors, it were impoſſible not to admit the truth and correctneſs of the majority of the accounts of the efficacy of *Perkiniſm*. We muſt obſerve, however, that the efficacy was founded on the deluſion: and had not the ſcientific world been at that time in a ſtate of comparative ignorance reſpecting the principle of which Galvani had recently obtained a glance; had they been in total ignorance of that principle, or poſſeſſed of more than that "little knowledge" of it, which "is a dangerous thing," ſuch an impoſture would ſcarcely have gained ground for a day, among thoſe who were acquainted with the proceedings of the French commiſſioners in the affair of Meſmer. But Perkins aſſociated the idea of the Galvanic principle, or animal electricity, with the operation of his tractors, by conſtructing them of two different metals, which the Italian philoſopher had ſhewn to be neceſſary to excite the operation of the agent which he had diſcovered: and the obſcurity which hung over this ſubject, (for the great developement of the Galvanic principle by the pile of Volta, and the trough which followed, had not then taken place,) left a new field for hypotheſis, and the anomalous character of the facts contributed to induce even philoſophers to liſten to the relation.

But Dr. Haygarth, a philoſopher, to whom his profeſſion and his country are deeply indebted for more important ſervices (ſee CONTAGION, FEVER-*ward*, and HOUSE *of Recovery*), ſuſpected the true ſource of the phenomena, produced by the tractors, from the firſt promulgation of the ſubject. Recollecting the developement of the animal magnetiſm, he ſuggeſted to Dr. Falconer, about the end of the year 1798, when the tractors had already obtained a high reputation at Bath, even among perſons of rank and underſtanding, that the nature of the operation of the tractors might be correctly aſcertained by a pair of *falſe tractors*, reſembling the real ones; and it was reſolved to put the matter to the teſt of experiment in the general hoſpital of that city. They therefore contrived two *wooden tractors*, of nearly the ſame ſhape as the metallic, and painted to reſemble them in colour. Five caſes were choſen of chronic rheumatiſm, in the ankle, knee, wriſt, and hip: one of the patients had alſo gouty pains. All the affected joints, except the laſt, were ſwelled, and all of them had been ill for ſeveral months.

"On the 7th of January, 1799, the *wooden* tractors were employed. All the five patients, except one, aſſured us that their pain was relieved, and three much benefited by the firſt application of this remedy. One felt his knee warmer, and he could walk much better, as he ſhewed us with great ſatisfaction. One was eaſier for nine hours, and till he went to bed, when the pain returned. One had a tingling ſenſation for two hours. The wooden tractors were drawn over the ſkin ſo as to touch it in the *ſlighteſt* manner. Such is the wonderful force of the imagination!

"Next day, January 8th, the true metallic tractors of Perkins were employed exactly in like manner, and with ſimilar effects. All the patients were in ſome meaſure, but not more relieved by the ſecond application, except one, who received no benefit from the former operation, and who was not a proper ſubject for the experiment, having no exiſting pain, but only ſtiffneſs in her ankle. They felt (as they fancied) warmth, but in no greater degree than on the former day." Of the Imagination as a Cauſe and as a Cure of the Diſorders of the Body, exemplified by fictitious Tractors and epidemical Convulſions. By John Haygarth, M. D. F.R.S. &c. Bath, 1800.

Such were the firſt experiments attempted with the view of aſcertaining the nature of *Perkiniſm!* But Dr. Haygarth's pamphlet contained an account of ſtill more deciſive trials made in the Briſtol infirmary, by Mr. Smith, one of the ſurgeons to that eſtabliſhment. This gentleman firſt operated, with two *leaden* tractors, on Tueſday, April 19th, on a patient who had been ſome time in the Infirmary, "with a rheumatic affection of the ſhoulder, which rendered his arm perfectly uſeleſs." In the courſe of ſix minutes no other effect followed the application of theſe pieces of *lead* than a warmth upon the ſkin: neverthele ſs the patient informed Mr. Smith, on the following day, that "he had received ſo much benefit, that it had enabled him to lift his hand from his knee, which he had in vain ſeveral times attempted on the Monday evening, as the whole ward witneſſed." But although it was thus proved that the patent tractors poſſeſſed no ſpecific powers independent of ſimple metals, he thought it adviſable to lay aſide metallic points, leſt the proofs might be deemed leſs complete. "Two pieces of wood, properly ſhaped and painted, were next made uſe of; and in order to add ſolemnity to the farce, Mr. Barton held in his hand a ſtop-watch, whilſt Mr. Lax minuted the effects produced. In four minutes the man raiſed his hand ſeveral inches, and he had loſt alſo the pain in his ſhoulder, uſually experienced when attempting to lift any thing. He continued to undergo the operation daily, and with progreſſive good effect; for on the 25th he could touch the mantle-piece.

“On the 27th,” Mr. Smith continues, “in the preſence of Dr. Lovell and Mr. J. P. Noble, two common iron nails, diſguiſed with ſealing-wax, were ſubſtituted for the pieces of mahogany before uſed. In three minutes the ſame patient ‘felt ſomething moving from his arm to his hand,’ and ſoon after he touched the Board of Rules, which hung a foot above the fire-place. This patient at length ſo far recovered, that he could carry coals, &c. and uſe his arm ſufficiently to aſſiſt the nurſe: yet previous to the uſe of the ſpurious tractors, ‘he could no more lift his hand from his knee than if a hundred weight were upon it, or a nail driven through it,’ as he declared in the preſence of ſeveral gentlemen, whoſe names I ſhall have frequent occaſion to mention. The fame of this caſe brought applications in abundance; indeed it muſt be confeſſed, that it was more than ſufficient to act upon weak minds, and induce a belief that theſe pieces of wood and iron were endowed with ſome peculiar virtues.” See Dr. Haygarth's Pamphlet, p. 8.

Many other equally ſtriking inſtances of the curative operation of the imagination, when excited by the *ſham* tractors, might be quoted from the pamphlet in queſtion; but we ſhall confine our account to a caſe, which fell under our own obſervation. Immediately after the publication of Dr. Haygarth's expoſition, the writer of this article, then a ſtudent at Edinburgh, was deſirous of being convinced, by perſonal experience, of the truth of his ſuggeſtion. Having procured two pieces of ſtick, painted both of a leaden colour, himſelf and a friend operated upon three or four individuals in various painful complaints. A ſervant girl, afflicted with a moſt acute head-ache, which ſhe declared had rendered her nights altogether reſtleſs for nearly a fortnight, readily ſubmitted to theſe potent *electrical* inſtruments, as we called them. We moved them about near the forehead, *never touching her;* and in four minutes ſhe ſaid ſhe felt a ſenſation of a tranſient chillineſs in the head; in a minute or two more ſhe felt as if cold water was running down the temples, and the pain was ſomewhat diminiſhed; but in the ſpace of ten minutes ſhe declared that the head-ache was entirely gone. On the following day ſhe came to thank us for the good ſleep which ſhe had enjoyed through the night, and then continued free from head-ache: but we underſtood that in a few days ſhe ſuffered a ſlight return of it. In the other caſes ſome relief was afforded, but not ſo marked as in this; they were, indeed, of an inflammatory nature, and leſs likely to be ſpeedily cured.

After having peruſed this abundant evidence of the powers of the imagination, not only in producing various affections of the body, but in removing others which exiſt, we can have no difficulty in crediting many relations of cures performed by perſons ſuppoſed to be gifted with extraordinary powers, or employing other pretended agents, all of which may be referred to the ſame common principle. One of the moſt ſingular inſtances of this kind, both from the number of cures performed, and the rank, learning, and character of the perſons who atteſted them, is to be found in the perſon of Valentine Greatraks, who flouriſhed in the latter part of the 17th century.

§ 13. *The Cures of Valentine Greatraks, and others.*—The proceedings of this pious and apparently ſincere man are very intereſting, as affording a hiſtory of the power of imagination and confidence over certain diſorders of the body. He was the ſon of an Iriſh gentleman of good education and property, who died in his childhood. Diſguſted with the religious and political contentions of his country in the time of Cromwell, he retired from the world apparently in a ſtate of melancholy derangement and bad health, which had been nearly terminated fatally. On recovering he became one of the puritans of the day, and after having acted ſome time as a magiſtrate, he had “an impulſe or ſtrange perſuaſion” in his mind, which continued to preſent itſelf, whether he was in public or in private, ſleeping or waking, “that God had given him the bleſſing of curing the king's evil.” Accordingly he commenced the practice of touching for this diſeaſe about the year 1662, which he continued for three years; at this time the ague became very epidemical, and the ſame impulſe within him ſuggeſted, “that there was beſtowed upon him the gift of curing the ague,” which he alſo practiſed with ſucceſs, by laying his hands on the patients. At length he found his power extended to epilepſy and paralytic diſorders, &c.; but he candidly acknowledges that many were not cured by his touch. Nevertheleſs the unbounded confidence in his powers, and conſequently the facility with which the imagination of the ignorant would be acted upon, muſt be manifeſt from the following ſtatement, which he ſent to Mr. Boyle. “Great multitudes from divers places reſorted to me, ſo that I could have no time to follow my own occaſions, nor enjoy the company of my family and friends: whereupon I ſet three days in the week apart (from ſix in the morning till ſix at night), to lay my hands on all that came, and ſo continued for ſome months at home. But the multitudes which came daily were ſo great, that the neighbouring towns were not able to accommodate them: whereon, for the good of others, I left my home, and went to Youghall, where great multitudes reſorted to me, not only of the inhabitants, but alſo out of England; ſo that the magiſtrates of the town told me, that they were afraid that ſome of the ſick people that came out of England might bring the infection into the place: whereon I retired again to my houſe at Affane, where (as at Youghall) I obſerved three days, by laying my hands on all that came, whatſoever the diſeaſes were (and many were cured, and many were not); ſo that my ſtable, barn, and malt-houſe were filled with ſick people of all diſeaſes almoſt, &c.” See “A Brief Account of Mr. Valentine Greatraks, and divers of the ſtrange Cures by him lately performed. Written by himſelf in a Letter addreſſed to the Hon. Robert Boyle, eſq.” London, 1723, p. 32. This pamphlet was publiſhed originally in 1666.

We ſhall not extend this article by quoting the hiſtories of caſes certified by ſeveral phyſicians, as well as by divines and philoſophers; among whom were the names of Robert Boyle, Dr. Cudworth, Dr. Whichcot, &c. We may remark, that ſome of the caſes of head-ache and rheumatiſm, reſemble moſt accurately thoſe which were cured by the ſpurious tractors above-mentioned; and that the hand of Greatraks can only be conceived to have operated in the ſame way. The influence of the imagination was likewiſe obvious in ſeveral convulſive affections, in the ſame manner as in the women at Paſſy, who fell into the *criſis* before the magnetiſm was applied. Greatraks mentions ſeveral poor people that went from England to him, “and amongſt the reſt, two that had the falling-ſickneſs, who *no ſooner ſaw me*, than they *fell into their fits* immediately;” and he reſtored them, he affirms, by putting his hands upon them. (Loc. cit. p. 34.) Nay, he tells us, that even the touch of his *glove* had driven many kinds of pains away (p. 30.), and removed ſtrange fits in women (p. 32.); and that the ſtroking of his hand or his glove had, in his opinion, and that of other perſons preſent, driven ſeveral devils, or evil ſpirits, out of a woman, one after the other, “every one having been like to choke her (when it came up to her throat), before it went forth.” Now, this whole deſcription contains a pretty accurate picture of an ordinary hyſterical fit, with its attendant *globus*, terminating with the diſcharge of flatus. P. 31.

About the ſame period, a Capuchin friar, whoſe name was Franciſco Bagnone, was famous in Italy for the ſame gift of healing, by the touch of the hands only; and was attended wherever he went by great multitudes of ſick people, upon whom he operated numerous and ſurpriſing cures, which were deemed true miracles. So general was the belief in his curative powers, that even a prince of Parma, who had laboured under a febrile diſeaſe for the ſpace of ſix months, was induced to apply to him, and was immediately cured by his voice only. The prince himſelf, and many others that were preſent, afterwards bore public teſtimony to the fact. It appears, however, as might be anticipated, and as Greatraks honeſtly acknowledges with reſpect to his own attempts, that great numbers of perſons, who applied to the friar with full faith in his powers, were not benefited. A celebrated Venetian phyſician, Tacchenius, affirms that it was notorious, that many (etiam plurimos) of the ſick left his preſence as feeble and wretched as when they were admitted: "et ita abiiſſe, ut admiſſi erant, miſeros atque imbecilles, et vidi ipſe et vulgo conſtat." It is curious to obſerve, how the ſame diſcuſſions and the ſame arguments are repeated in different ages, when the ſame ſubject is agitated. Tacchenius ſays, that many perſons, eſpecially of the higher claſſes, aſcribed the whole of the affair to the imagination: but to this it was replied, that children, wrapped in their ſwaddling clothes, were cured through the faith of their parents. Nevertheleſs, he ſays, he ſaw ſome children brought to the monk ſeveral times, who were carried home as ſickly as they went. Yet he confeſſes himſelf unable to make up his opinion reſpecting ſo occult a matter, which is maintained and diſputed by ſo many people. It will be recollected, that the friends of Perkins maintained, in anſwer to Dr. Haygarth's obſervations, that ſheep and horſes had been cured by the metallic tractors, and therefore the influence of imagination was out of the queſtion.

Pechlin, a celebrated Daniſh phyſician, to whom the above ſtated facts were communicated, and who referred them excluſively to the imagination, mentions another perſon, of the name of Marcus Avianus, a man of auſtere manners, and bearing a high reputation for ſanctity, who obtained a great fame, with a certain claſs of credulous people, for the cure of diſeaſes in this way. It is certain, however, he adds, that all his efforts were not equally ſucceſsful; and many, who were apparently cured, ſpeedily relapſed. See Jo. Nic. Pechlini Obſerv. Phyſico-Medic. lib. iii. Obſ. xxxii.

But it is unneceſſary to enumerate the individuals, the De Mainaducs, the Preſcotts, &c. who have at different times been diſtinguiſhed by the poſſeſſion of various occult methods of healing the ſick. The practice has occaſionally prevailed in almoſt all ages; and we have ſeen, in the detail of experiments above related, that the faculty of the imagination, in certain habits and conditions of the body, and eſpecially in the irritable female conſtitution, is actually capable of producing all thoſe effects on the corporeal frame, which have been deemed the reſult of occult agency and extraordinary powers.

§ 4. *Effects of Magic, Incantations, Amulets, Holy Relics, &c.*—Admitting this, then, as an eſtabliſhed principle of the human conſtitution, and making due allowances for the exaggerations and miſrepreſentations of ignorance and ſuperſtition, we are enabled to give a rational explanation of many hiſtorical relations, which have been conſidered as altogether fabulous, or as direct violations of truth. We are well aware of the facility with which the imagination is excited in an uninformed perſon, and more particularly in an age of profound ignorance, which is, for that reaſon, commonly an age of ſuperſtition. We know, too, that in the middle ages, when every form of ſcience was almoſt unknown, and the laws of nature had not been inveſtigated, the ſmalleſt diſcovery in natural philoſophy, chemiſtry, or aſtronomy, was deemed the reſult of ſupernatural communication with the world of ſpirits; and the diſcoverer or poſſeſſor of the knowledge was looked upon as a being gifted with ſupernatural powers. In ſuch a ſtate of the human mind, when natural philoſophy, meagre as it was, was diſguiſed with the name, and clothed with all the ſuppoſed agencies of *magic*; and when every perſon, with a little more knowledge than his neighbours, was maſter of ſo many *magnets*, ſo many *tractors*, by which he could rule the imaginations of the multitude; it cannot be the ſubject of our wonder, that the magician's rod (or the philoſopher's cane) ſhould produce ſuch mighty operations, or that a ſcrap of his writing ſhould be a remedy for many maladies. Theſe only executed what was afterwards performed by M. Deſlon's extended fingers, and Valentine Greatraks' glove! The effects, then, of the *incantations*, *amulets*, and all the arts of magic, witchcraft, and aſtrology, by which the more artful pretenders to ſuperior knowledge impoſed upon the people, may be allowed to have actually occurred, and to have been the reſult of natural cauſes; and they are plainly referrible to one common ſource, with thoſe of animal magnetiſm, Perkiniſm, and various other modifications of the imagination in fetters.

It is ſcarcely neceſſary to add, that, during the ſame periods of ignorance and ſuperſtition, thoſe extremely pious and comparatively learned perſons, who have been enrolled in the catalogue of ſaints, muſt neceſſarily have obtained the moſt complete veneration and confidence from the multitude; and hence, after their death, every relic of their bodies or clothing, the ſhrines in which they were entombed, fragments of the inſtruments of their execution (in the caſes of martyrdom), and every other object that could excite, by aſſociation, thoſe reverential feelings, uſually called up by a contemplation of their character, would become ſo many agents upon the imagination, by which all the extraordinary changes in the animal economy above deſcribed might be effectually produced. Thus we cannot doubt that there is much foundation for the hiſtories of recovery from various diſeaſes, occaſioned by removing the ſick to the tombs of celebrated worthies, or placing them before the ſtatues and images of theſe perſons, or by touching them with nails taken from the coffins, or rings from the fingers, or the bones of the fingers themſelves of theſe ſaints, or by the influence of an infinity of relics of this ſort, which cannot be ſuppoſed to poſſeſs leſs power over a ſuperſtitious mind, than the painted *tractors* of a ſurgeon, or the glove of an enthuſiaſt.

§ 5. *Influence of the Imagination in Aid of Medicine.*—Since it is obvious, then, that the imagination is capable of producing very important changes in the nervous and vaſcular ſyſtems, independently of the operation of medicine; the phyſician will infer, that this faculty may be employed as a powerful adjuvant in his hands, and that, by a combination of the moſt active remedies of both body and mind, he may extend the uſefulneſs of his art to the utmoſt bounds. A very able phyſician, Dr. Lind of Haſlar, long ago deduced this inference from an intereſting occurrence at Breda, related by Vander Mye. "An important leſſon in phyſic," he ſays, "is here to be learned, namely, the wonderful and powerful influence of the paſſions of the mind upon the ſtate and diſorders of the body. This is too often overlooked in the cure of diſeaſes; many of which are ſometimes attempted by the ſole mechanical operation of drugs, without calling into aſſiſtance the ſtrong powers of imagination, or the concurring influences of the ſoul. Hence it is, that the ſame remedy will not produce the like effect, even in the ſame perſon, when given by different hands." (See Lind's Treatiſe on Scurvy.) The hiſtory given by Vander Mye is ſtrongly illuſtrative of the ſubject before us.

During the ſiege of Breda, in 1625, the garriſon was afflicted with the ſcurvy in a moſt dreadful degree. "When the prince of Orange heard of their diſtreſs," ſays this phyſician, "and underſtood that the city was in danger of being delivered up to the enemy by the ſoldiers; he wrote letters addreſſed to the men, promiſing them the moſt ſpeedy relief. Theſe were accompanied with medicines againſt the ſcurvy, ſaid to be of great price, but of ſtill greater efficacy: many more were yet to be ſent them. The effects of this deceit were truly aſtoniſhing! Three ſmall phials of medicine were given to each phyſician, not enough for the recovery of two patients. It was publicly given out, that three or four drops were ſufficient to impart a healing virtue to a gallon of liquor. We now diſplayed our wonder-working balſams; nor were even the commanders let into the ſecret of the cheat put upon the ſoldiers. They flocked in crowds about us, every one ſoliciting that part may be reſerved for their uſe. Cheerfulneſs again appears on every countenance, and an univerſal faith prevails in the ſovereign virtues of the remedies. The herbs now beginning to ſpring up above the ground, of theſe we make decoctions, to which wormwood and camphor were added, that by the prevalent flavour of theſe, they might appear medicines of no mean efficacy. The ſtiff contracted limbs were anointed with wax, melted in rapeſeed or linſeed oil. The invention of new and untried phyſic is boaſted; and amidſt a defect of every neceſſary and uſeful medicine, a ſtrange medley of drugs was compounded. The effect, however, of the deluſion was really aſtoniſhing; for many were quickly and perfectly recovered. Such as had not moved their limbs for a month before, were ſeen walking the ſtreets ſound, ſtraight, and whole. They boaſted of their cure by the prince's remedy: the motion of their joints being reſtored by a ſimple friction with oil, and the belly now of itſelf well performing its office, or at leaſt with a ſmall aſſiſtance from medicine. Many who declared they had been rendered worſe by all former remedies, recovered in a few days to their inexpreſſible joy, and the no leſs general ſurpriſe by taking (almoſt by having brought to them) what we affirmed to them to be their gracious prince's cure." Lind's loc. cit. and Fred. Vander Mye, de morbis et ſymptomatibus popularibus Bredanis, tempore obſidionis.

Another rule of medical practice is to be deduced, Dr. Haygarth obſerves, from the facts which were aſcertained from the experiments with the fictitious tractors. "A patient ought always to be inſpired in the beſt manner poſſible, with confidence in any remedy which is adminiſtered: but if a favourable opinion of it cannot be obtained, and eſpecially if there be a marked prejudice againſt it, another (though a leſs powerful) medicine ought to be preferred." Haygarth, loc. cit. p. 28.

The preceding ſtatements illuſtrate alſo the great advantages of medical reputation, in conſequence of the faith of the ſick in the medicines preſcribed by thoſe who are poſſeſſed of it. This explains what has been frequently obſerved, that the ſame remedy will produce more beneficial effects, when preſcribed by a famous phyſician, or an aſſuming empiric, than when taken from the hands of a perſon of leſs character and notoriety. Magnificent and unqualified promiſes, in the latter caſe, inſpire weak minds with implicit confidence. "Omne ignotum pro magnifico." Upon this principle we may account for the marvellous recoveries frequently aſcribed to *empirical* remedies, which are often inert drugs, and generally applied by the ignorant patient in diſorders totally different from what the quack himſelf pretends that he can cure. Hence alſo it may be obſerved, that *new* medicines, even when their compoſition is known, if recommended to the public with exalted praiſe, have ſometimes been attended with great ſucceſs, much greater than future experience confirmed. From the ſame views it is apparent, why reputation, however abſurdly obtained, will contribute to enable certain perſons to cure ſome diſeaſes. Thus kings, old women, and *ſeventh* ſons, who have had medical diplomas aſſigned to them by common conſent for many ages, have probably ſometimes worked cures. Nevertheleſs we have ſeen, that there were other attractions to the preſence of kings, beſides the *royal touch*, when that was in vogue; and the *angel* was perhaps the beſt ingredient in the remedy. See EVIL, *King's*.

After all that has been ſaid, ſome perſons may nevertheleſs be ſceptical as to the power of the imagination over the corporeal organs, illuſtrated in this article, and think it impoſſible that ſuch great phyſical changes can be produced by a mere mental affection. How, they will aſk, can any operation of mind at once modify the actions of veſſels, nerves, and muſcles, over which the will has no controul? Nothing is more myſterious or inſcrutable than the operations of the mind upon the body; ſo that the proximate cauſe of the motion of the muſcles of any organ, by a thought, a volition of the mind, is altogether incomprehenſible. The only anſwer, therefore, that can be given to this queſtion, conſiſts in ſhewing that analogous effects of the operation of the mind in regard to organs not ſubject to the will are frequent in the animal economy.

We have a familiar example of the inſtantaneous change in the action of blood-veſſels, occaſioned by an affection of the mind in the act of *bluſhing*, in which the cutaneous veſſels of the face are immediately diſtended with blood, from the feeling of ſhame: and a ſtill greater diſtention of veſſels occurs in ſome other organs of the body, as the immediate conſequence of certain paſſions. On the contrary, other mental emotions, ſuch as fear and terror, as ſpeedily diminiſh the action of the blood-veſſels; whence the ſudden *paleneſs* which overſpreads the perſon under ſuch emotions; nay, when theſe are violent, the whole ſyſtem of circulation, heart and arteries together, is often inſtantaneouſly ſuſpended in its motions; if this ſuſpenſion be merely temporary, as is uſual, *ſyncope* or *fainting* only occurs; if it be permanent, which has ſometimes happened, death enſues. In delicate and irritable habits, and therefore eſpecially in the female ſex, very ſlight affections of the mind will produce *convulſions*, and all the other effects which were exhibited in the *criſes* of animal magnetiſm. *Hyſterical* paroxyſms are thus frequently produced by the mimic pathos of a theatrical ſcene; by the ſlighteſt emotions of alarm and apprehenſion, and even by joy; and they often enſue after a continued attention to ſome intereſting object. Even the convulſions of *epilepſy* have been excited by the mere ſight of a perſon afflicted by them. (See IMITATION.) In fact, the mind has an extenſive influence over ſpaſmodic and convulſive diſeaſes, which depend chiefly upon the unuſual mobility of the nervous ſyſtem, from the ſlight convulſion of *hiccup* to the moſt violent hyſterical fit: and as the motions of the heart and arteries are cloſely connected with the ſtate of the brain and nerves, through the ſame medium the force, rapidity, and regularity of the circulation may be variouſly affected. It would ſeem, indeed, that by a continued direction of the *attention* to particular parts of the body, combined with a belief in the efficacy of a ſuppoſed remedy applied to them, the action of particular portions of the circulating ſyſtem may be conſiderably modified. For not only has this effect ariſen from the external employment of the *tractors ;* but even the internal organs, *e. g.* the ſtomach and bowels, have been acted upon by medicines of ſuppoſed efficacy which had been ſwallowed. There are inſtances on record of *bread pills* operating as purgatives, when adminiſtered with the aſſurance that they would produce that effect : and it is well known, that not only the ſight of a perſon in the act of vomiting, but even the thought or recollection of it, has produced the inverted action of the fibres of the ſtomach, and vomiting itſelf. Turner mentions a young gentleman who was a patient of his, and who having taken ſeveral draſtic emetics, became ſo diſguſted, that he could vomit by the force of imagination as effectually as from the moſt active medicine. The ſight of a bolus produced this effect immediately, again and again, whenever it was produced. " Nay, ſo great and admirable," ſays Turner, " is the idioſyncraſy of this gentleman, that if at meals or in company, though never ſo well before, other perſons talked but of a bolus, or himſelf caſually thought upon the ſame, it was odds if he was not forced to riſe from table and fall a vomiting." Turner on Diſeaſes of the Skin, chap. xii. See alſo Pechlin. Obſ. Med. Phyſ. the third book of which relates chiefly to the influence of the mind on the body ; and Whytt on Nervous Diſorders, chap. v. ſect. 6.

On the whole, then, there is ample evidence of the influence of the mind over the actions of the nervous and muſcular parts of the body, which are not under the ſubjection of the will ; and therefore we have the concurring proofs, both from analogy and direct experiment, in favour of referring all the phenomena comprehended in this article, to one and the ſame principle. See alſo IMITATION.

IMAGINATION, in *Muſic*, was too much fettered during the ſeventeenth century by canon, fugue, and eccleſiaſtical modes, to attempt the uſe of her wings. In the peruſal of the muſic of the times, we collected fragments of the infant liſp in the vocal language, which has been ſince ſo highly poliſhed ; but neither found in the ſubjects of fugue, or vocal diviſions, any thing like invention or grace, till after the time of Cariſſimi and Stradella, who ſeem to have been the firſt gifted muſicians in Italy.

In England, crowded and elaborate as is the harmony, and uncouth and antiquated the melody in the collection of the beſt compoſitions of the time, in queen Elizabeth's virginal book, there is a manifeſt ſuperiority in thoſe of Bird over all the reſt, both in texture and deſign. In a later age his genius would have expanded in works of invention, taſte, and elegance ; but, at the period in which he flouriſhed, nothing ſeems to have been thought neceſſary for keyed-inſtruments, except variations to old tunes, in which all the harmony was crowded, which the fingers could graſp, and all the rapid diviſions of the times, which they could execute. Even nominal fancies were without fancy, and confined to the repetition of a few dry and unmeaning notes in fugue, or imitation. Invention was ſo young and feeble, as to be unable to go alone ; and old chants of the church, or tunes of the ſtreet, were its leading-ſtrings and guides.

IMAGINIFER, among the Romans, an enſign-bearer, who carried the ſtandard on which was repreſented the image of the reigning emperor. See SIGNA.

IMAGLIN, in *Geography*, a ſmall iſland in the Straits, between the weſtern coaſt of America, and the eaſt point of Ruſſia. N. lat. 65° 40′. E. long. 189° 44′.

IMAGO, in *Natural Hiſtory*, is a name given by Linnæus to the third ſtate of inſects, when they appear in their proper ſhape and colours, and under no more transformation.

IMALGAN, in *Geography*, a ſmall iſland in the ſea of Mindoro. N. lat. 10° 51′. E. long. 121° 5′.

IMAM, or IMAN, a miniſter in the Mahometan church, anſwering to a pariſh prieſt among us.

The word properly ſignifies what we call a prelate, *antiſtes*, one who preſides over others ; but the Muſſulmen frequently apply it to a perſon who has the care and intendency of a moſque, who is always there at firſt, and reads prayers to the people, which they repeat after him.

IMAM is alſo applied, by way of excellence, to the four chiefs or founders of the four principal ſects in the Mahometan religion.

Thus Ali is the imam of the Perſian, or of the ſect of the Schiites ; Abu-beker the imam of the Sunnites, which is the ſect followed by the Turks ; Saphii, or Safi-y, the imam of another ſect, &c.

The Mahometans do not agree among themſelves about this *imamate*, or dignity of the imam. Some think it of divine right, and attached to a ſingle family, as the pontificate of Aaron. Others hold, that it is, indeed, of divine right, but deny it to be ſo attached to any ſingle family, as that it may not be transferred to another. They add, that the imam is to be clear of all groſs ſins ; and that otherwiſe he may be depoſed, and his dignity may be conferred on another. However this be, it is certain, that after an imam has once been owned as ſuch by the Muſſulmen, he who denies that his authority comes immediately from God, is accounted impious ; he who does not obey him, is a rebel ; and he who pretends to contradict what he ſays, is eſteemed a fool, among the orthodox of that religion. The imams have no outward mark of diſtinction ; their habit is the ſame with that of the Turks in common, except that the turban is a little larger, and folded ſomewhat differently.

IMAM *of Sana*. See SANA and YEMEN.

IMAMIA, a name given to that ſect of the Mahometans, to which the Perſians adhere. See IMAM.

IMAMZADE, in *Geography*, a town of Perſia, in the province of Farſiſtan ; 20 miles S. of Darabgherd.

IMAMZADE-*Kaſim*, a town of Perſia, in the province of Irak ; 30 miles S.W. of Ghulpaigan.

IMANDRA, a conſiderable lake of Ruſſian Lapland.

IMAUS, in *Ancient Geography*, part of a long chain of mountains, which traverſed Independent and Ruſſian Tartary, with the extent and direction of which the ancients were very imperfectly acquainted. According to them, this chain divided Scythia into two parts, *viz.* Scythia intra Imaum, and Scythia extra Imaum. Ptolemy not only deſcribes an Imaus as running N. and S., which is the Belur-Tag of the Ruſſians and Tartars, with its ridges to the W., now called Argun, Ak-tau, &c. ; but another Imaus paſſing E. and W. to the N. of Hindooſtan. As the Northern Imaus of Ptolemy is clearly the Belur-Tag, ſo his Southern Imaus may be ſafely regarded, ſays Pinkerton, as the Himmaleh of the Hindoos ; which we may allow to have been known to the ancients, who were no ſtrangers to the rich Gangetic regions of Hindooſtan. Nor was it abſurd to conſider the Himmaleh as a S.E. prolongation of the Northern Imaus. See HIMMALEH.

IMBA, in *Geography*, a town of Japan, in the iſland of Niphon; 70 miles E. of Jedo.

IMBANKING. See Banking.

IMBARGO, or Embargo, a ſtop or ſtay put upon ſhips, or merchandize, uſually by public authority. See Embargo.

IMBATTLED. See Embattled.

IMBECILITY, a ſtate of languor and decay; wherein the body is not able to perform its uſual exerciſes or functions.

IMBER, in *Ornithology*. See Colymbus *Immer*.

IMBEZLE, or Imbezzle, is probably from the old Engliſh word to waſte, pilfer, or purloin.

As where a perſon intruſted with goods, waſtes, conſumes, and diminiſhes them, he is ſaid to imbezzle them. Perſons that imbezzle, or illegally diſpoſe of any woollen, linen, fuſtian, cotton, or iron materials; or gloves, leather, ſhoes, &c. with which they are entruſted for manufacture, ſhall forfeit double the value, or be ſent to the houſe of correction, and there whipped, and kept to hard labour fourteen days: and for the ſecond offence, forfeit four times the value, &c. Buyers and receivers are liable to the ſame penalties, 13 Geo. II. c. 8.

If any ſervant imbezzles, purloins, or makes away his maſter's goods, to forty ſhillings value, it is made felony without benefit of clergy, 12 Ann. c. 7. Imbezzling the king's armour, or ſtores, is felony by 31 Eliz. c. 4.; other inferior imbezzlements and miſdemeanours of the ſame kind are puniſhed with fine, corporal puniſhment, and impriſonment, by 9 & 10 Will. III. c. 41. 1 Geo. I. c. 25. 9 Geo. I. c. 8. and 17 Geo. II. c. 50. The uſual method of proceeding againſt high officers who imbezzle the public money is by impeachment in parliament. At common law the offender is ſubject to a diſcretionary fine and impriſonment. Imbezzling, or vacating records, is a felonious offence againſt public juſtice, 8 Hen. VI. c. 12.

IMBIBE, is commonly uſed in the ſame ſenſe as *abſorb*, *viz.* where a dry porous body takes up another that is moiſt.

IMBLOCATION, in *Middle Age Writers*, a particular method of diſpoſing of the dead bodies of excommunicated perſons, by raiſing over them a heap of ſtones, or earth. This was done in the fields, or near highways; it being unlawful to bury them in holy ground, or even to inter them at all. See Burial.

The word is derived from *bloc*, tumulus.

IMBRA Christos, in *Geography*, a town of Abyſſinia; 145 miles S.E. of Gondar.

IMBRICARIA, in *Botany*, was ſo named by Dr. Smith in his paper on the "Botanical Characters of ſome Plants of the Natural Order of *Myrti*." Linn. Soc. Tranſ. v. 3. 257. This is the *Jungia* of Gærtner, but Linnæus in his Supplementum Plantarum having already dedicated a plant, of a very different genus, to the memory of Jungius, it became neceſſary to give this of Gærtner another denomination. Profeſſor Gmelin called it *Mollia*, but as that was of uncertain derivation it was purpoſely changed. "In preference, therefore, to *Mollia* (ſays Dr. Smith), this genus is called *Imbricaria* in alluſion to its imbricated foliage. A farther reaſon for my choice of this name is to aboliſh the *Imbricaria* of Gmelin, taken up by him from Juſſieu, which I know from original ſpecimens to be the identical *Mimuſops Kauki* of Linnæus, of which Juſſieu, after Commerſon's Manuſcripts, made a diſtinct genus on account of its fruit having eight cells, and as many ſeeds; but Commerſon obſerved that four or more of theſe were often abortive; and on the other hand Rumphius tells us the *Mimuſops* has often as many as three or four perfect ſeeds. It is probable, therefore, that the germen has eight cells and eight ſeeds, moſt of which are generally abortive; a ſtriking inſtance of the neceſſity of ſtudying that part in all its ſtates."

Gen. Ch. *Cal.* Perianth ſuperior, in five ſegments. *Cor.* of five petals. *Stam.* Filaments five. *Piſt.* Germen of two cells, one of which is frequently abortive; ſtyle ſolitary; ſtigma globoſe. *Peric.* Capſule inferior, crowned with the rounded teeth of the calyx, coriaceous, ſmooth, ovate, ſomewhat compreſſed. *Recept.* none. *Seeds* from four to eight, ſmall, ovate, brown.

Eſſ. Ch. Petals five. Stigma capitate. Capſule covered by the calyx, of two cells and many ſeeds.

1. I. *crenulata*. Linn. Soc. Tranſ. v. 3. 259. (Jungia imbricata; Gærtn.) "Leaves obovate-wedge ſhaped, crenulated towards the top. Petals and calyx toothed." A native of Port Jackſon, New South Wales.—*Stem* about a foot high, tough and wiry, thickly imbricated with ſmooth, ſhining, carinated *leaves*. *Flowers* lateral. Whole plant ſmooth.

2. I. *ciliata*. Linn. Soc. Tranſ. v. 3. 259. "Leaves triangularly-linear. Calyx fringed. Germen five-ſided." A native alſo of New South Wales.—*Stem* branched, thickly imbricated with minute, ſhining *leaves*, among which the *flowers* ſeem imbedded.

Theſe are the only ſpecies known; but it has been ſuggeſted that the *Jungia tenella* of Gærtner might be added to this genus. This laſt mentioned author ſuſpected the *Eſcallonia* of Linn. Suppl. to be the ſame as his *Jungia*, but theſe genera differ eſſentially in the latter having a capſule inſtead of a berry, not to mention other particulars.

IMBRICATED is uſed, by ſome botaniſts, to expreſs the figure of the leaves of ſome plants, which are hollowed like an *imbrex*, or gutter-tile, or are laid in cloſe ſeries over one another like the tiles of a houſe.

Imbricated *Cup*, *imbricatus calyx*, a term uſed by authors to expreſs the cups of ſome of the plants which have compound flowers; in which the common perianthium, ſurrounding the whole cluſter of flowers, is compoſed of ſeveral ſeries of ſquamæ, the exterior of which is ſhort, and the interior longer, but in great part hid under theſe upper ones.

Imbricated *Shell*, *imbricata concha*, in *Natural Hiſtory*, a term uſed in general to expreſs any ſpecies of ſhell-fiſh, whoſe ſhells are elevated into tranſverſe ridges, lying over one another at the baſe, in the manner of the tiles on a houſe-top. It has alſo been uſed as the name of a peculiar ſpecies of ſhell: this is a *cordiformis*, or heart-ſhell, whoſe ſides are remarkably ridged in this tranſverſe manner, and at the ſame time ſo divided longitudinally by ſeven high ribs running from the apex to the edge, that the whole repreſents the roof of a houſe with the beams and rafters, before they are covered by the tiling. Hence the French call it *faitiere*.

IMBRO, in *Geography*, an iſland in the Grecian Archipelago, mountainous and woody, with plenty of game; about 20 miles in circumference and containing five villages, two of which are defended by caſtles. N. lat. 40° 10′. E. long. 25° 46′.

IMELBORN, a town of Germany, in the county of Henneberg; 34 miles S.E. of Salzungen.

IMER, la Signora, in *Biography*, a female opera ſinger in London 1746, at the ſame time as Monticelli. Though ſhe was nominally the firſt woman, ſhe never ſurpaſſed mediocrity in voice, taſte, or action.

IMGNAEL, in *Geography*, a town of Norway, in the dioceſe of Drontheim; 56 miles N.N.E. of Runſdal.

IMHOFF, John William, in *Biography*, an eminent genealogiſt, was a German of a noble family, who devoted himſelf to the ſtudy of hiſtory, politics, and particularly the deſcents and alliances of all the great houſes in Europe. His principal works are "De Notitia Procerum Germaniæ:" "Hiſtoria Genealogica Italiæ et Hiſpaniæ:" "Familiarum Italiæ, Hiſpaniæ, Portugalliæ, Magnæ Britanniæ, cum Appendice:" "Recherches ſur les Grands d'Eſpagne." He died in 1728.

IMIDSU, in *Geography*, a town of Japan, in the iſland of Niphon; 130 miles N.W. of Jedo.

IMIRETTA, Imeritia, or Immeretia, a country of Aſia, in European Turkey, which lies between the Caſpian and Black ſeas, bounded on the E. and S E. by Georgia, on the N. by Oſſetia, or that part of Circaſſia, called the government of Caucaſus, on the W. by Mingrelia, and on the S. by Turkiſh Armenia. It pertains to the ancient Iberia, and is about 80 miles from N. to S., and nearly as much from E. to W. The country is mountainous and poor; and the inhabitants are wanderers and vagabonds. Although it could formerly ſupply an army of 20,000 men, it is now thinly peopled, on account of the number of children purchaſed by the Turks, and an impoſition laid upon them of furniſhing annually 80 young men, between 10 and 20 years of age. The governing prince aſſumes the title of king of kings. The towns are few; but the principal ſeems to be Cotatis.

IMITATION, in the *Arts of Deſign*, has, as in other things, two acceptations; one of a confined, the other of a more vague ſenſe. In the firſt it ſignifies merely copying cloſely the forms or colours of a work of art or nature; in the ſecond, it is ſufficient that the ſtyle of the thing imitated be maintained; and it is in this latter ſenſe moſt frequently applied. Thus Raphael may be ſaid to have imitated in his latter works the ſtyle of Michael-Angelo in deſign; and Julio Romano his maſter Raphael. Thus the whole Venetian ſchool endeavoured to imitate Titian and Paul Veroneſe; and the Flemiſh Rubens, Rembrandt, and Teniers.

Imitation, thus conſidered, is the true ſource of advancement in art. Were it not for the attempt to follow in the paths of great men, the arts would be always in their infancy; be always ſtationary in their progreſs, if we may uſe the expreſſion; and therefore whilſt we deprecate a long continuance of dull copying the effects and defects of the greateſt maſters, we would recommend to all youths engaged in the polite arts, at all times to keep in their mind's-eye at leaſt, the works of thoſe who have ſucceſsfully paſſed the ordeal of time: and moſt probably if they have original genius within them, its fire will be moſt uſefully elicited by rivalry thus laudably excited. And not to youths alone will this conduct be found uſeful; right happy ought he to feel himſelf, who, adopting this plan, ſhall become able to unite the various beauties he may thus ſelect.

Too much ſtreſs has been laid upon what is termed originality, to which title it would appear excentricity has the ſureſt claim. But that is not the foundation upon which the great artiſts of Italy, Spain, and Flanders, proceeded in their labours. Step by ſtep they advanced upon the merits of their predeceſſors; till at laſt their own excellencies ſeem to leave little room for further advance in true taſte: yet that mode of ſtudy which has produced ſo much, bids moſt fair to produce whatever may beſt be effected in art: *viz.* a careful imitation in the firſt inſtance of what has been done, till the mind is informed of the moſt important principles of art: and then a judicious examination, how far theſe works correſpond with nature; and wherein they are capable of receiving new beauties, conſiſtent with the laws and principles by which ſhe is governed. How far poſitive imitation of nature is, in painting or ſculpture required by, or conſiſtent with the beſt principles of thoſe arts, ſee the article Ideal, in *Painting* and *Sculpture*.

Imitation may here be conſidered as one of the ſources of pleaſure to Taſte. Accordingly it gives riſe to what Mr. Addiſon terms the ſecondary pleaſures of imagination, which form, without doubt, a very extenſive claſs. For all imitation affords ſome pleaſure; not only the imitation of beautiful or great objects, by recalling the original ideas of beauty or grandeur, which ſuch objects themſelves exhibited; but even objects, which have neither beauty nor grandeur, nay, ſome which are terrible or deformed, pleaſe us in a ſecondary or repreſented view. The high power, ſays Dr. Blair, which eloquence and poetry poſſeſs, of ſupplying taſte and imagination with ſuch a wide circle of pleaſures, they derive altogether from their having a greater capacity of imitation and deſcription than is poſſeſſed by any other art. Of all the means which human ingenuity has contrived for recalling the images of real objects, and awakening, by repreſentation, ſimilar emotions to thoſe which are raiſed by the original, none is ſo full and extenſive as that which is executed by words and writing. By the aſſiſtance of this happy invention, there is nothing, either in the natural or moral world, but what can be repreſented and ſet before the mind, in colours very ſtrong and lively. Hence it is uſual among critical writers, to ſpeak of diſcourſe as the chief of all the imitative or mimetic arts; they compare it with painting and with ſculpture, and in many reſpects prefer it juſtly before them. However, neither diſcourſe in general, nor poetry in particular, can be called altogether imitative arts. We muſt diſtinguiſh, ſays Dr. Blair, betwixt imitation and deſcription, which are ideas that ought not to be confounded. Imitation is performed by means of ſomewhat that has a natural likeneſs and reſemblance to the thing imitated, and of conſequence is underſtood by all; ſuch are ſtatues and pictures. Deſcription, again, is the raiſing in the mind the conception of an object by means of ſome arbitrary or inſtituted ſymbols, underſtood only by thoſe who agree in the inſtitution of them; ſuch are words and writing. Words have no natural reſemblance to the ideas or objects which they are employed to ſignify; but a ſtatue or a picture has a natural likeneſs to the original. And therefore imitation and deſcription differ conſiderably in their nature from each other. Nevertheleſs, imitation and deſcription agree in their principal effect, of recalling, by external ſigns, the ideas of things which we do not ſee. But though in this they coincide, it ſhould not be forgotten, that the terms themſelves are not ſynonymous, that they impart different means of effecting the ſame end; and of courſe make different impreſſions on the mind. Blair's Lect. vol. iii. See Poetry.

Imitation, in *Muſic*, dramatic or theatrical, belongs to imitation, as much as poetry and painting do: in this inſtance it is a principle common to all arts. But this imitation does not belong to all arts to the ſame extent. All that the imagination can convey to the mind belongs to poetry. Painting, which cannot preſent its pictures to the imagination, but to ſenſe, and to one ſenſe only, can only paint objects ſubmitted to the judgment of the eye. Muſic ſhould ſeem to have the ſame bounds with reſpect to the ear; however, ſhe can repreſent every thing, even objects that are only viſible: by an illuſion almoſt inconceivable, ſhe ſeems to put the eye into the ear; and the greateſt miracle of an art, which totally depends on movement, is, that it can excite an idea of repoſe. Night, ſleep, ſolitude, and ſilence; all enumerated among the great pictures of muſic. It is known that noiſe can produce the effect of ſilence, and ſilence the effect of noiſe: as when we fall aſleep during an even-toned and monotonous reading, and that we wake the inſtant it ceaſes. But muſic acts more immediately upon our ſenſation in exciting by one ſenſe ſimilar affections to thoſe which we can excite by another. And, as the relations cannot be ſenſible unleſs the impreſſion is forcibly made, painting, ſtripped of this force, cannot return to muſic thoſe imitations which muſic draws from her ideal painting. Let all nature ſleep, the perſon who contemplates her at ſuch time is not aſleep. And the muſician's art conſiſts in ſubſtituting to the inſenſible object that of movement, which its preſence excites in the heart of the beholder. It will not only agitate the ſea, increaſe the flames of a conflagration, render the ſtream of a river more rapid, produce ſhowers, and ſwell torrents; but will paint the horror of a frightful deſert, blacken the walls of a ſubterraneous dungeon, calm the tempeſt, render the air tranquil and ſerene, and ſhed from the orcheſtra new freſhneſs on the grove. It will not repreſent theſe things directly; but it will awaken in the mind the ſame ſenſations which we feel in ſeeing them.

It has been ſaid in the article HARMONY, that we can draw from it no principle of muſical imitation, as there is no relation between chords and objects which we wiſh to paint, or paſſions which we would expreſs. See MELODY.

IMITATION, in its technical ſenſe, is uſing the ſame, or a ſimilar paſſage or melody, in many different parts, which are heard one after the other: in the uniſon, 5th, 4th, 3d, or in any other interval whatever. Imitation is always pleaſing, even if many notes are changed, provided the air is not ſo diſguiſed as to be no longer recognizable, and the rules of modulation are not violated. Often, in order to render imitation more perceptible, it is preceded by a reſt, or by long notes, which ſeem to extinguiſh the melody at the very moment when it is renewed by the imitation. Imitations are warrantable at our pleaſure; they are confined to no particular intervals, they may be continued or changed for another, or the imitation made in *moto contrario*, or contrary motion, or in what way we pleaſe. The ſeveral performers like it better than a dull and dry accompaniment; it renders a part more amuſing to the player and important to the hearer; the rules are as relaxed as thoſe of fugue are rigid: for which reaſon great maſters diſdain imitations from the facility with which they are compoſed; and when purſued too cloſely with the manifeſt ambition of being particularly noticed, they diſcover the *young* contrapuntiſt. Rouſſeau.

IMITATION, *Principle of*, in *Medicine*. Man was characterized by Ariſtotle as an *imitative* animal; and a propenſity to imitation appears from the firſt dawn of reaſon in infants, and in ſome meaſure accompanies us through life. By this term, we do not mean to deſignate that voluntary and deliberate imitation, by which we copy the dreſs, language, or manners of others; but that ſort of *irritative* imitation, (to adopt the language of Dr. Darwin,) of which we are almoſt unconſcious, and to which we are drawn mechanically, as it were, by a propenſity, which it requires an act of volition to reſiſt;—"cette imitation machinale, qui nous porte malgré nous à répéter ce qui frappe nos ſens," as the French commiſſioners have expreſſed it. (Rapport des Commiſſaires, chargés par le Roi de l'Examen du Magnetiſme Animal, p. 77; Paris 1784.) The moſt familiar example of this propenſity that can be adduced, is the act of *yawning*, which is readily propagated from one perſon through a whole company. But there is ſcarcely any irregular action of any organ of the body, which has not been caught (to uſe a common phraſe), in conſequence of this tendency to imitation, by different individuals: thus *ſquinting*, *ſtammering*, *winking* with the eyes, and various unſeemly habits, have been frequently acquired, by aſſociating with thoſe to whom they were already habitual. In a ſimilar manner, many people are immediately excited to the act of *vomiting* by the ſight of a perſon in the ſame act; and various convulſive diſorders have been cauſed by looking on others affected with them. Baglivi mentions a young man, who, looking at a perſon in an *epileptic* fit, was himſelf affected in the ſame manner: and Dr. Whytt ſays, "it has frequently happened in the Royal Infirmary here (at Edinburgh), that women have been ſeized with *hyſteric* fits, from ſeeing others attacked with them;" a fact, which the writer of this article has alſo witneſſed in the ſame hoſpital.

A remarkable example of this infectious nature of convulſive diſeaſes, (if the term may be uſed in this ſenſe,) occurred in the poor's houſe at Haerlem, under the inſpection of the learned Dr. Boerhaave, of which his nephew has given the following account. "In the houſe of charity at Haerlem, a girl, under an impreſſion of terror, fell into a convulſive diſeaſe, which returned in regular paroxyſms. One of the by-ſtanders, intent upon aſſiſting her, was ſeized with a ſimilar fit, which alſo recurred at intervals; and on the day following, another was attacked; then a third, and a fourth; in ſhort, almoſt the whole of the children, both girls and boys, were afflicted with theſe convulſions. No ſooner was one ſeized, than the ſight brought on the paroxyſm in almoſt all the reſt at the ſame time. Under theſe diſtreſſing circumſtances, the phyſicians exhibited all the powerful antepileptic medicines with which their art furniſhed them; but in vain. They then applied to Boerhaave, who, compaſſionating the wretched condition of the poor children, repaired to Haerlem; and whilſt he was inquiring into the matter, one of them was ſeized with a fit, and immediately he ſaw ſeveral others attacked with a ſpecies of epileptic convulſion. It preſently occurred to this ſagacious phyſician, that, as the beſt medicines had been ſkilfully adminiſtered, and as the propagation of the diſeaſe from one to another appeared to depend on the imagination, (or the principle of imitation,) by preventing this impreſſion upon the mind, the diſeaſe might be cured: and his ſuggeſtion was ſucceſsfully adopted. Having previouſly appriſed the magiſtrates of his views, he ordered, in the preſence of all the children, that ſeveral portable furnaces ſhould be placed in different parts of the chamber, containing burning coals, and that irons, bent to a certain form, ſhould be placed in the furnaces; and then he gave theſe farther commands:—that all medicines would be totally uſeleſs, and the only remedy with which he was acquainted, was, that the firſt who ſhould be ſeized with a fit, whether boy or girl, muſt be burnt in the arm, to the very bone, by a red-hot iron. He ſpoke this with uncommon dignity and gravity; and the children, terrified at the thoughts of this cruel remedy, when they perceived any tendency to the recurrence of the paroxyſm, immediately exerted all their ſtrength of mind, and called up the horrible idea of the burning; and were thus enabled, by the ſtronger mental impreſſion, to reſiſt the influence of the morbid propenſity." (Abr. Kaau-Boerhaave, Impet. faciens; Hippoc. dictum, ix. § 406.) This caſe affords at once an illuſtration of the powerful operation of the imitative principle, and of the influence of the imagination, when excited by ſtrong impreſſions, over the diſeaſes of the body, as related in a preceding article. See IMAGINATION.

If we trace the operation of this imitative propenſity a little farther, we find that convulſive diſorders are not only communicated, in this manner, to perſons who live in the ſame houſe or apartment; but that they have, in many inſtances, been propagated from houſe to houſe, by the intimate intercourſe of perſons in the ſame neighbourhood, and thus a ſort of *epidemical convulſions* has been produced. At the latter end of the year 1796, Dr. Haygarth was conſulted reſpecting a convulſive malady, which prevailed for ſome time among the tenants of the earl of Uxbridge and Holland Griffith, eſquire, in the iſland of Angleſey. This diſeaſe gradually ſpread from one girl to twenty-three others, all between the age of ten and twenty-five; except one boy, ſeventeen years old, all the patients were females. This diſorder began with pain in the head, and ſometimes in the ſtomach and ſide, but not very violent: this was ſucceeded by violent twitchings or convulſions of the upper extremities, continuing with little intermiſſion, and cauſing the ſhoulders almoſt to meet by the exertion. The ſecond perſon attacked was ſiſter of the firſt, and lived in the ſame houſe; the third and fourth were acquaintances, and had been much alarmed at ſeeing the fits of the firſt patient. In the courſe of two or three months, eighteen girls were thus attacked, of whom only two had recovered. The influence of the imagination, as well as of the principle of imitation, was obvious from the general alarm and anxiety which prevailed; a ſtate of mind which prediſpoſes to the operation of this principle, as was exemplified by the animal-magnetiſm. (See IMAGINATION.) “All of them,” ſays Mr. Griffith, “as far as I can underſtand, were taken much in the ſame manner with the firſt three. Their lower extremities are free from ſpaſms, although they find themſelves conſiderably relaxed. The leaſt alarm throws them into a ſhaking fit. They have in general a hiccup. The anxiety of parents, ſiſters, brothers, friends, &c. for their recovery, is particularly obvious in this neighbourhood.” (See Dr. Haygarth's pamphlet, “On the Imagination as a Cauſe and as a Cure of Diſorders of the Body; exemplified by fictitious Tractors, and epidemical Convulſions,” 1800.) This intelligent phyſician, after preſcribing ſome antiſpaſmodic medicines, deſired Mr. Griffith to uſe all his authority to prevent girls and young women from having any communication with perſons affected with theſe convulſions, and to keep thoſe who were ill of the diſtemper ſeparate from each other, as much as poſſible. “I warned him,” Dr. Haygarth ſays, “that if theſe cautions were not obſerved, the epidemic might ſpread through the whole iſland of Angleſey.” Loc. cit. p. 35.

Dr. Haygarth was led to take this view of the ſubject, from his recollection of the caſe of the children in the poor-houſe at Haerlem, and of the occurrence of a convulſive diſeaſe of the hyſterical kind, which, about thirty years before, had ſpread through the ſhire of Angus, in Scotland. Several imperfect deſcriptions of this malady may be found in the “Statiſtical Account” of Scotland. (See alſo Edin. Med. and Surg. Journ. for Oct. 1807, vol. iii. p. 434.) Dr. Whytt long ago noticed the frequency of convulſions in Zetland, and he adduced the extreme facility with which they were propagated among the young women of that iſland, as a proof of the exiſtence of a wonderful ſympathy between the nervous ſyſtems of different individuals, by means of which various motions and morbid ſymptoms are often transferred from one to another, without any corporeal contact or infection. (Eſſay on Nervous Diſorders, chap. iii. ſect. vi.) An account of this diſeaſe, related by the miniſter of the pariſh of Unſt, the moſt northerly of the Shetlands, is given in the Edinburgh Journal, juſt quoted. “There is a ſhocking diſtemper, which has of late years prevailed pretty much,” (he writes in 1774,) “eſpecially among young women, and was hardly known 30 or 40 years ago. About that period *only one perſon* was ſubject to it. The inhabitants gave it the name of convulſion fits; and, indeed, in appearance, it ſomething reſembles an epilepſy. In its firſt riſe, it began with a palpitation in the heart, of which they complained for a conſiderable time; it at length produced ſwooning fits, in which people ſeized with it would lie motionleſs upwards of an hour. At length as the diſtemper gathered ſtrength, when any violent paſſion ſeized, or on a ſudden ſurpriſe, they would all at once fall down, toſs their arms about, writhe their bodies into very odd ſhapes, crying out all the while moſt diſmally, throwing their heads about from ſide to ſide, with their eyes fixed and ſtaring. At firſt this diſtemper obtained in a private way with one female, but ſhe *being ſeized in a public way at church*, the diſeaſe was communicated to others, but whether by the influence of fear or *ſympathy* is not eaſy to determine.” (P. 438, vol. iii.) In another of the northern pariſhes, Delting, the diſeaſe was very prevalent. “The patient is firſt ſeized with ſomething like fainting, and immediately after utters wild cries and ſhrieks, the ſound of which, at whatever diſtance, immediately puts all who are ſubject to the diſorder in the ſame ſituation. It moſt commonly attacks them *when the church is crowded*, and often interrupts the ſervice in this and many other churches in the country. On a ſacramental occaſion, fifty or ſixty are ſometimes carried out of the church, and laid in the church yard, where they ſtruggle and roar with all their ſtrength for five or ten minutes, and then riſe up without recollecting a ſingle circumſtance that happened to them, &c.” (See Statiſtical Account, vol. i. p. 385, 1791.) In this deſcription we recognize the features of hyſteria; and the influence of moral cauſes in removing, as well as in inducing theſe convulſive maladies, was evinced in the pariſh of Northmaven, where the diſeaſe was thus extinguiſhed. “The cure is attributed to a rough fellow of a kirk-officer, who toſſed a woman in that ſtate, with whom he had been frequently troubled, into a ditch of water. She was never known to have the diſeaſe afterwards, and others dreaded the like treatment.” (Stat. Acc. vol. xii. p. 363, 1794.) Here the principle of cure was perfectly analogous to that reſorted to by Boerhaave in the work-houſe at Haerlem.

Every ſpecies of mental emotion is propagated in a ſimilar manner among crowds of people under various circumſtances, and the more readily when they are accompanied by corporeal actions. If the ſight of a number of perſons, in the act of yawning, almoſt irreſiſtibly impels us to yawn with them; ſo the ſight of a multitude of ſorrowful countenances, or of countenances in furious anger, carries us into ſimilar feelings, and renders us moſt acutely ſuſceptible of correſponding impreſſions from the ſlighteſt cauſes. Hence ariſes much of the *magnanimity* of armies, on the one hand, and the facility of the propagation of *panic*, on the other; hence the uncontrollable fury of mobs, &c. But there is no general emotion, which renders the body more completely ſubſervient to every degree of this ſympathetic or imitative influence, than that of religious enthuſiaſm. This was exemplified, in a ſtriking manner, in the epidemic convulſions, which occurred in the pariſh of Cambuſlang, in Lanarkſhire, in 1742, and is well deſcribed by Dr. Meik. The miniſter, Mr. M'Culloch, who was an enthuſiaſt, and a follower of Whitefield, by inceſſant zeal and labour in his vocation, and by reading and circulating, in halfpenny pamphlets, various miſſives, atteſtations, and journals, giving an account of converſions in different parts of the world, excited an extraordinary concern about religion in his neighbourhood. In conſequence of a petition, ſigned by ninety maſters of families, a weaver and a ſhoemaker being at their head, he gave evening lectures on the week days occaſionally; and afterwards they were daily employed for many hours in fervent prayer; in the miniſter's houſe, and hearing his lectures; and great numbers cried out publicly, and many returned to his houſe expreſſing ſtrong convictions of ſin and alarming fears of puniſhment. "The way in which the converts were affected," ſays Dr. Meik, "for it ſeems they were affected much in the ſame way, though in very different degrees, is thus deſcribed. They were ſeized all at once, commonly by ſomething ſaid in the ſermons and prayers, with the moſt dreadful apprehenſions concerning the ſtate of their ſouls, inſomuch that many of them could not abſtain from crying out in the moſt public and frightful manner, "bewailing their loſt and undone condition by nature, &c. &c.; declaring that they ſaw the mouth of hell open to receive them, and that they heard the ſhrieks of the damned;" but the univerſal cry was, "what ſhall we do to be ſaved?" The agony under which they laboured, was expreſſed not only by words, but alſo by violent agitations of body; by clapping their hands and beating their breaſts; by *ſhaking* and *trembling*, by *faintings* and *convulſions;* and ſometimes by exceſſive bleeding at the noſe. While they were in this diſtreſs, the miniſter often called out to them, not to ſtifle or ſmother their convictions, but to encourage them; and after the ſermon was ended, he retired with them to the manſe, and frequently ſpent the beſt part of the night with them in exhortations and prayers," &c. Some of thoſe, it is ſaid, who thus "fell under conviction," were never converted; but ſome were converted in a few hours.

It is impoſſible to read this account without recollecting the operations of Meſmer with his animal magnetiſm, and their cloſe ſimilarity with theſe fanatical proceedings; eſpecially the exact analogy of the phenomena, when the magnetiſed perſons were ſaid to *fall into the criſis* ("tomber en criſe"), and theſe zealots to *fall under conviction.* Both theſe events were the reſult of ſtrong impreſſions on the imagination continued for ſome time; in both, the ſighings and ſobbings, the faintings and convulſions occurred; and in both theſe criſes were moſt rapidly produced, after one perſon had become thus affected. (See IMAGINATION.) Under the article juſt referred to, we have adduced the demonſtrative proofs, obtained by the French commiſſioners, that all thoſe phenomena attributed to *magnetiſm*, were the products of the heated *imagination*, augmented by the principle of *imitation;* and we cannot but refer theſe analogous effects of fanaticiſm to the ſame natural cauſes. Upon this ground they were generally explained at the time by rational people. "That the work of Cambuſlang ought to be aſcribed neither to the influence of the Holy Spirit, nor to the influence of the devil, but to the influence of fear and hope, of ſympathy and example, aided by peculiar circumſtances, was the general opinion of thoſe," Dr. Meik obſerves, "who are known in the church of Scotland by the name of the moderate party. The only extraordinary circumſtance relating to this work, is the external effect on the bodies of men by which it manifeſted itſelf; and theſe, they thought, might be ſufficiently explained by the operation of natural cauſes, &c." "When this work was once begun, they maintained, that the effects of ſympathy and example (*i. e.* the principle of imitation) ſufficiently explain its future progreſs. Every day's experience ſhews that we are *diſpoſed to imitate* the actions of others, and that we are naturally, and, as it were, *mechanically* moved by ſeeing them, either in the depth of diſtreſs, or in the height of exultation. The operation of theſe principles was viſible in almoſt every inſtance. Whenever any one was affected, many others were affected in a ſimilar manner. Whenever any one cried aloud, either through exceſſive grief or joy, but eſpecially the former, many others cried aloud likewiſe, uſing the ſame words, or words of the ſame meaning. Statiſt. Acc.

At a ſtill more recent period, namely, in the ſummer of 1803, a ſpecies of *chorea*, or St. Vitus dance, became epidemic in Teneſſee, in America, connected with the prevalence of religious enthuſiaſm. Great numbers of people were collected together, eſpecially at their extraordinary meetings, which commonly laſted from three to five days; and many of them remained on the ſpot day and night, the whole or greater part of the time, worſhipping their Maker almoſt inceſſantly. "The outward expreſſions of their worſhip conſiſted chiefly in alternate crying, laughing, ſinging, and ſhouting, and, at the ſame time, performing that great variety of geſticulation which the muſcular ſyſtem is capable of producing. It was under theſe circumſtances that ſome found themſelves unable, by voluntary efforts, to ſuppreſs the contractions of their muſcles; and to their own aſtoniſhment and the diverſion of many of the ſpectators, they continued to act from *neceſſity* the curious character which they had commenced from *choice.* The diſeaſe no ſooner appeared than it ſpread with rapidity through the medium of the principle of *imitation:* thus it was not uncommon for an affected perſon to communicate it to the greater part of a crowd, who, from curioſity or other motives, had collected around him. It is at this time (1805) in almoſt every part of Teneſſee and Kentucky, and in various parts of Virginia; but it is ſaid not to be ſo contagious (or readily communicated) as at its commencement. It attacks both ſexes, and every conſtitution; but evidently more readily thoſe who are enthuſiaſts in religion (ſuch as thoſe above deſcribed), and females: children of ſix years of age, and adults of ſixty, have been known to have it; but a great majority of thoſe affected are from fifteen to twenty-five. The muſcles generally affected are thoſe of the trunk, particularly of the neck, ſometimes thoſe of the ſuperior extremities, but rarely, if ever, thoſe of the inferior. The contractions are ſudden and violent, ſuch as are denominated convulſive, being ſometimes ſo powerful, when in the muſcles of the back, that the patient is thrown on the ground, where for ſome time his motions more reſemble thoſe of a live fiſh, when thrown on land, than any thing to which I can compare them. This, however, does not often occur, and never, I believe, except at the commencement of the diſeaſe, &c." See an Inaugural Eſſay on Chorea Sancti Viti. By Felix Robertſon, of Teneſſee, Philadelphia, 1805. Edin. Med. and Surg. Journal, vol. iii. p. 446.

In conſequence of the facility with which ſuch convulſive motions are communicated by *imitation*, various corporeal movements which fanaticiſm or enthuſiaſm had aſſociated with devotional exerciſes, have become characteriſtic of certain ſects, to which they have even given names. From this ſource, it would appear, have originated the appellations of *Jumpers*, *Whirlers*, *Tremblers;* and even our now placid ſect, the *Quakers*, have doubtleſs derived their denomination from ſome ſimilar habit. A ſingular ſpaſmodic diſeaſe, the chorea Sti. Viti, or *Saint Vitus's dance*, has moſt probably derived its appellation from the reſemblance of the involuntary motions of the limbs to ſome of thoſe religious or fanatical geſticulations. Tradition ſtates that it was ſo named from the annual religious aſſemblies and fanatical dances, in honour of St. Vitus, which were celebrated on the firſt of May, at Ulm and Ravenſpurg, and other parts of Germany. See CHOREA.

This ſubject is far from being exhauſted. The preceding ſtatements, however, ſeem to afford a ſatisfactory illuſtration of a ſympathy, or a mechanical, *i. e.* an involuntary tendency to *imitation*, which is a part of the human conſtitution, and is as viſible in the ſlighteſt actions, ſuch as yawning, as in thoſe which more forcibly arreſt attention, and excite emotions, ſuch as convulſive fits. And when to this principle we add the power of the imagination over the phyſical ſtate of the body, as evinced by the effects of metallic and counterfeit tractors, of the touching of kings and other gifted perſons, of ſainted ſhrines and relics, and of animal magnetiſm, &c.; we are enabled to explain the occurrence of a number of extraordinary phenomena in the hiſtory of man, which, if we viewed his moral and phyſical faculties ſeparately, would appear altogether inexplicable by natural cauſes.

Dr. Haygarth has deduced this practical inference, for the direction of the phyſician, from the conſideration of theſe facts; namely, that convulſive diſorders ought not to be admitted into the female wards of hoſpitals; a ſuggeſtion which he cauſed to be acted upon in the Cheſter Infirmary. And it is important to know that, in diſtricts where convulſive diſeaſes are obſerved to be ſpreading, any medical or other intelligent and humane neighbour, who has influence and authority to hinder all intercourſe between perſons afflicted with and liable to ſuch diſorders, may prevent ſuch calamities. See Dr. Haygarth's pamphlet, alſo Rapport des Commiſſaries above quoted, p. 67, *note*, where ſeparation was proved to be an effectual cure. Similar caſes may be found, in a work of M. Hecquet, "Le Naturaliſme des Convulſions."

Imitation, in *Oratory*, is an endeavour to reſemble a ſpeaker or writer in thoſe qualities, with regard to which we propoſe them to ourſelves as patterns. The firſt hiſtorians among the Romans, ſays Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how cloſely Virgil has imitated Homer in his Æneid, Heſiod in his Georgics, and Theocritus in his Eclogues. Terence copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad Auguſt. who himſelf owes many of his beauties to the Greek lyric poets. Cicero appears, from many paſſages in his writings, to have imitated the Greek orators. Thus Quintilian ſays of him, that he has expreſſed the ſtrength and ſublimity of Demoſthenes, the copiouſneſs of Plato, and the delicacy of Iſocrates. Inſt. Or. lib. x. cap. 1.

Writers on rhetoric have propoſed three enquiries under the head of imitation, *viz.* Who are to be imitated? What we are to imitate? and in what manner? With reſpect to the firſt we ſhall only obſerve, that in common caſes it is not always what is abſolutely beſt, but comparatively ſo in its own kind, and beſt ſuits their own taſte, that ſhould determine perſons in the choice of their patterns for imitation: however, only the beſt writers, and thoſe whom we can moſt ſafely truſt, ſays Quintilian, are to be read long. With reſpect to the ſecond enquiry, the things to be imitated are the perfections of the beſt maſters in their ſeveral kinds; and theſe are different, according to the various ſubjects in which they excel. As to the manner of imitation, it ought to be conſidered, that he who only copies or tranſlates from another, and endeavours to paſs it off for his own, is not an imitator but a plagiary. The true art of imitation conſiſts in ſo diverſifying what we take from others, as, if we can, to improve it, or at leaſt not ſuffer it to receive any detriment by our alteration. And this may be done, by ſo enlarging a thought, or expreſſion taken from another, as in a good meaſure to render it our own: by either abridging, or only taking a part of what another has ſaid before us; by keeping the thought and applying it to a different ſubject; and finally, by preſerving the thoughts and applying them to the ſame ſubject, but changing their order, and repreſenting them in a different dreſs. See Ward's Orat. vol. ii. ſect. 53 and 54.

IMITAZIONE, *Ital.* imitation, in *Muſic.* See Fugato.

IMIZIMIS, in *Geography*, a town of Morocco, on the mountains of Atlas; 60 miles S.W. of Morocco.

IMLIATSKAIA, a town of Ruſſia, in the government of Upha, on the river Imliat; 60 miles E.N.E. of Tcheliabinſk.

IMMA, in *Ancient Geography*, a town of Aſia, in Syria; ſituated at the northern point of a mountain E. of Orontes, towards the ſouth-eaſt of Antiochia.

IMMACULATE, *without ſtain*, a term much uſed among the Romaniſts: when ſpeaking of the conception of the Bleſſed Virgin, they call it immaculate.

When the cap is given to a doctor of the Sorbonne, he is obliged to ſwear that he will defend the immaculate conception. This was decreed by an act of the Sorbonne in the fourteenth century; in imitation of which, eighty other univerſities made the ſame order.

The military orders in Spain are all ſolemnly obliged to defend this prerogative of the Virgin. See Conception.

There is alſo a Congregation of the Immaculate Conception; in moſt nunneries whereof is a ſociety of ſecular maids, whoſe end is to honour the immaculate conception: of which they make a public proteſtation every year, and a private one every day. See Theatines.

IMMANENT, in *Logic.* The ſchoolmen diſtinguiſh two kinds of actions; the one *tranſient*, which paſs from the agent to the patient; the other *immanent*, which continue in the agent. See Action.

IMMATERIALITY, abſtraction from matter; or what we underſtand by pure ſpirit.

Plato proves the immateriality of the ſoul from theſe ſix topics. 1. Its ſimplicity. 2. Its independency on the body, which is twofold; in its *eſſe*, and in its *operari* in exiſting, and in acting or operating ſeparately. 3. Its rule and authority over the body. 4. Its likeneſs and ſimilitude to God, which diſcovers itſelf in the pleaſure it enjoys in ſpiritual things, in its aiming at ſpiritual objects, &c. 5. Its ſpiritual manner of perceiving material objects. And, laſtly, its indiviſibility, capacity, activity, and immortality. See Soul.

IMMEDIATE, that which precedes or follows ſome other thing, without any interpoſition.

Immediate alſo ſignifies ſomething that acts without means, or without medium. In which ſenſe we ſay, immediate grace, and immediate cauſe, &c.

Immediate *Mode.* See Mode.

Immediate *Fire.* See Fire.

IMMEMORIAL, an epithet given to the time or duration of any thing whoſe beginning we know nothing of.

In a legal ſenſe, a thing is ſaid to be of time immemorial, or time out of mind, that was before the reign of our king Edward II.

IMMENDORF, in *Geography*, a town of Auſtria, eight miles N. of Sonneberg.

IMMENHAUSEN, a town of the principality of Heſſe-Caſſel; eight miles N.N.W. of Caſſel. N. lat. 51° 5′. E. long. 9° 25′.

IMMENSE, that whoſe amplitude, or extenſion, no finite meaſure whatſoever, or how oft ſoever repeated, can equal.

IMMENSTADT, in *Geography*, a town of Germany, in the county of Konigſegg, on a ſmall river, which ſoon after joins the Iller; 12 miles S. of Kempten.

IMMER, one of the iſlands called New Hebrides, in the South Pacific ocean. S. lat. 19° 16′. E. long. 169° 46′.

IMMERETIA. See IMIRETTA.

IMMERSION, an act by which any thing is plunged into water, or ſome other fluid.

In the firſt ages of Chriſtianity, baptiſm was performed by immerſion; by three immerſions. The cuſtom of immerſion is ſaid to be ſtill preſerved in Portugal, and among the Anabaptiſts in other parts. See BAPTISM.

IMMERSION, in *Pharmacy*, is the preparation of ſome medicine, by letting it ſteep for ſome time in water, in order to take ſome ill quality or taſte from it.

This is done in rhubarb, to moderate its force; in lime to take away its ſalt; and in olives, which are preſerved in brine.

IMMERSION, in *Aſtronomy*, is when a ſtar or planet comes ſo near the ſun, that we cannot diſcern it; being as it were enveloped, and hid in the rays of that luminary.

IMMERSION alſo denotes the beginning of an eclipſe of the moon; that is, the moment when the moon begins to be darkened, and to enter into the ſhadow of the earth.

The ſame term is alſo uſed with regard to an eclipſe of the ſun, when the diſk of the moon begins to cover it.

In this ſenſe, immerſion ſtands oppoſed to *emerſion*, which ſignifies the moment wherein the moon begins to come out of the ſhadow of the earth; or the ſun begins to ſhew the parts of his diſk which were hid before.

IMMERSION is frequently applied to the ſatellites of Jupiter, and eſpecially to the firſt ſatellite; the obſervation whereof is of ſo much uſe for diſcovering the longitude.

The immerſion of that ſatellite is the moment in which it appears to enter within the diſk of Jupiter; and its emerſion the moment wherein it appears to come out.

The immerſions are obſerved from the time of the conjunction of Jupiter with the ſun, to the time of his oppoſition; and the emerſions from the time of his oppoſition to his conjunction. The peculiar advantage of theſe obſervations is, that during eleven months of the year they may be made, at leaſt, every other day. The perfection of the theory, and the praxis thereon, we owe to M. Caſſini.

IMMERSION, *Scruples of*. See SCRUPLE.

IMMICTIO, an inability of retaining the urine. See INCONTINENCE *of Urine*.

IMMORTAL, that which will laſt to all eternity, as having in itſelf no principle of alteration or corruption.

Plato defines immortality ȣσια εμψυχος και αιδιος μονη, *animated eſſence and eternal manſion*; and proves the immortality of the ſoul from two kinds of arguments; the one *artificial*, and the other *inartificial*.

The inartificial arguments for the ſoul's immortality are teſtimonies and authorities, whereof he cites ſeveral; and adds in general, that all the great men and poets, who had any thing divine in them, have at all times aſſerted the immortality of the ſoul.

Artificial or proper arguments for the immortality are either *ſpeculative* or *practical*: of the firſt kind are thoſe drawn from, 1. The ſimple, uniform, ſpiritual, and divine nature of the ſoul. 2. From its infinite capacity. 3. Its deſiring and longing after immortality, and its inward horror of falling into nothing; proving it abſurd that the ſoul ſhould die, when life is its proper and adequate object. 4. Its rational activity; proving that whatever has in itſelf a principle of rational and ſpontaneous motion, by which it tends towards ſome ſupreme good, is immortal. 5. The various ideas which it has of ſpiritual things; particularly the idea it has of immortality: and, 6. Its immateriality.

His practical or moral arguments for the immortality of the ſoul, are drawn from, 1. The juſtice of God, which can never ſuffer the wicked to eſcape unpuniſhed, nor the good unrewarded after death. 2. The dependence which religion has on this opinion, becauſe, without this perſuaſion, there would be no religion in the world. 3. The opinion which men have, that juſtice and every kind of virtue are to be cultivated, that they may at laſt live with God. 4. The ſtings of conſcience, and anxious ſolicitude we are under about a future ſtate. See SOUL.

IMMORTAL *Flower*, in *Botany*. See GOMPHRENA.

IMMUNITY, a privilege or exemption from ſome office, duty, or impoſition.

Immunity is more particularly underſtood of the liberties granted to cities and communities.

The princes heretofore granted all kinds of immunities to eccleſiaſtics, exempting them from all impoſitions; but the eccleſiaſtics of thoſe days were not ſo rich as thoſe of ours: they gave all they had to the poor.

There is ſtill a privilege of immunity in ſome places, and eſpecially in Italy, belonging to eccleſiaſtical things, and perſons; who are exempted from certain dues, and are ſheltered from the purſuits of juſtice. Though there are ſome crimes for which they cannot plead the privilege of their immunity, as premeditated murder, &c.

IMMUTABILE SYSTEMA. See SYSTEM.

IMMUTABILITY, the condition of a thing that cannot change.

Immutability is one of the divine attributes. See GOD.

IMMYNS, JOHN, in *Biography*, a ſelf-taught muſician, ſaid to have become a notable luteniſt after 40, by the peruſal of Maſter Mace, whoſe ideas, taſte, and language ſeem to have been perfectly congenial. Immyns founded the Madrigal ſociety, and was ſo convinced of the perfection of that ſpecies of muſic, particularly of queen Elizabeth's reign, that "he looked on Handel and Bononcini as the great corrupters of the ſcience." He had a cracked countertenor voice, played on the common flute, the viol da gamba, violin, and harpſichord, but on none of them well. Though originally an attorney, there was doubtleſs a conflict between the two profeſſions—

——— "but muſic won the cauſe."

However, with all his harmonical zeal and enthuſiaſm, he never obtained a higher rank in the profeſſion, than that of amanuenſis to Dr. Pepuſch, and copyiſt to the Academy of Ancient Muſic at the Crown and Anchor. Yet he was always in cheerful ſpirits; and the honour of having eſtabliſhed the Madrigal ſociety, and being its chairman at different alehouſes in the city, preſiding over dilettanti tradeſmen, mechanics, and pſalm ſingers, contributed as much, perhaps, to his pride and felicity, as the being preſident of the Royal Society, or ſpeaker of the houſe of commons could have done. But alas! the tyrant Death dragged him from all his ſublunary felicity in 1764.

IMOLA, INNOCENCIO DA. See FRANCUCCI.

IMOLA, in *Geography*, a town of Italy, in the department of the Amona, anciently called "Forum Cornelii," or "Forum Julii," ſituated on an iſland, formed by the river Salerno, ſurrounded with walls, towers, and ditches, and defended with a ſtrong caſtle; the ſee of a biſhop, ſuffragan of Ravenna. It contains 16 churches and 17 convents. After having been occupied by different poſſeſſors, Cæſar Borgia became maſter of it, and annexed it, with the reſt of Romagna, to the dominions of the church; 18 miles S.E. of Bologna. N. lat. 44° 22′. E. long. 11° 32′.

IMOMNAGUR, a town of Hindooſtan, in Bahar; 25 miles E.S.E. of Bahar.

IMORI, a town of Japan, in the iſland of Niphon; 16 miles S. of Meaco.

IMPACH, a town of Auſtria; ſix miles W.N.W. of Crems.

IMPALED, in *Heraldry*, is underſtood of a ſhield party per pale, or divided into two halves by a line drawn palewiſe through the middle, from the top to the bottom.

When the coats of arms of a man and his wife, who is not an heireſs, are borne in the ſame eſcutcheon, they muſt be impaled, or marſhalled in pale, *i. e.* the huſband's on the right ſide, and the wife's on the left; and this the heralds call *baron and femme*, two coats impaled.

Impaling hath been practiſed in three different ways: 1. By dimidiation, that is, by halving or cutting the ſhields of the arms of both huſband and wife into two equal parts, and then joining the dexter half of the huſband's coat to the ſiniſter half of the wife's; thus making up or forming a whole ſhield. In this mode, called "Accolée," the French kings uſed to impale the arms of Navarre. The 2d mode is by dimidiating the huſband's arms, and impaling that with the full coat of the wife's. The *laſt* general and preſent rule is that of impaling the two whole coats, except when there is a border round one or both of them; for the border muſt never be carried all round an impaled coat. This dimidiation of arms was much uſed in the reign of king Edward I.; in proof of which it is aſſerted by Mr. Sandford in his "Genealogical Hiſtory," that Margaret, ſiſter to Philip IV. king of France, and ſecond wife to king Edward I., had, on her ſeal, in 1299, the arms of England ſo dimidiated with thoſe of France, and that ſhe was the firſt queen of England who had her arms ſo marſhalled. This method of impaling arms by dimidiation hath been for ſome time laid aſide in England, though it has been continued in France. It was a frequent practice with the nobility of England, from the reign of Edward III. to that of Henry VII. to quarter the arms of the wife; and alſo to place her arms in the firſt quarter, in preference to the paternal coat of the huſband's family, particularly if her family was of greater dignity; and Mr. Niſbet, in his "Syſtem of Heraldry," informs us, that it is a cuſtom in Scotland, when a man marries an heireſs, for him to quarter her arms with his own paternal coat; but he allows that it is not practiſed in any other country. Our heraldic authors ſay, theſe are the rules to be obſerved in impaling the arms of huſband and wife. 1ſt. The huſband's arms are always to be placed on the right ſide as baron, and the wife's on the left as femme. 2dly. That no huſband can impale his wife's arms with his own, on a ſurcoat of arms, enſign or banner, but may uſe them impaled on other utenſils. 3dly. That no huſband impaling his wife's arms with his own, can ſurround the ſhield with the order of the garter, or with any other order; becauſe, as Mr. Sandford argues, although the huſband may give his equal half of his eſcutcheon, yet he cannot ſhare his temporary order of knighthood with her, except ſhe be ſovereign of the order. The mode lately adopted for knights of the Garter, Bath, and Thiſtle, to wear their arms and thoſe of their wives in two ſeparate ſhields, with the garter or order round their own coat only, is taken from the French; but Mr. Edmondſon does not hold this to be good armoury, becauſe the arms cannot be ſaid to be impaled baron and femme, as hath been uſual in England upwards of 600 years. However, on the deceaſe of the knight her huſband, when ſhe becomes a widow, the wife ought not in any reſpect to bear the garter round her arms, becauſe, on the demiſe of the knight, his honour of knighthood reverts to the crown.

It hath been laid down as a rule by many, that if a man hath had two wives, he may impale both their arms on the ſiniſter ſide, thoſe of the firſt wife in chief, and thoſe of the ſecond in baſe. It hath alſo been ſaid, that if a man hath had two wives, he may place his own arms in pale, and thoſe of his two wives on the dexter and ſiniſter ſide, giving the firſt the dexter ſide; and ſo, if he had ſix wives, he may place the arms of three of them on the dexter ſide, and thoſe of the other three on the ſiniſter ſide. But the errors of theſe poſitions, ſays Mr. Edmondſon, are ſo flagrant, that they need little argument to refute them. The intent of impaling a wife's arms is to ſhew that the man is then married to a woman of that particular family, whoſe arms are impaled with his own; therefore, when by her death he is releaſed from that marriage, he ceaſes to bear the arms of her family. The caſe is different in regard to a widow: whilſt ſhe remains ſuch, ſhe is obliged to bear the arms of her deceaſed huſband.

Kent aſſerts that no women, except ſuch as are heireſſes, are entitled to have their arms impaled with thoſe of the huſband; but this is abſurd, becauſe impaling arms is intended to point out the family into which the huſband is married, and not to indicate that the wife brought with her any real or perſonal property whatever. In impaling of a coat, you never put any marks of cadency for the firſt, ſecond, and third daughter; but if there be any marks of cadency on the father's coat, all his daughters muſt continue the ſame.

Impaled arms are alſo borne by officers, as well eccleſiaſtical as civil, as archbiſhops, biſhops, kings of arms, &c.; but with this difference from thoſe of the manner of impalement of the arms of baron and femme, *viz.* that the arms of the church are to be placed on the dexter ſide, and the man's on the ſiniſter. The like rule is to be obſerved in relation to civil officers.

IMPALEMENT, in a *penal* ſenſe. } See Empalement.
Impalement, in *Phytology*. }

IMPALPABLE, that whoſe parts are ſo extremely minute, that they cannot be diſtinguiſhed by the ſenſes, particularly by that of feeling.

IMPANATION, formed of *in* and *panis*, *bread*, a term uſed among divines to ſignify the opinion of the Lutherans with regard to the euchariſt; who believe that the ſpecies of bread and wine remain, together with the body of our Saviour, after conſecration. See Consubstantiation.

IMPANATORES. See Adessenarii.

IMPANNELLING, in *Law*. See Empanelling.

IMPARES Scamilli. See Scamilli.

IMPARFAIT, Fr. imperfect. This word has many acceptations in muſic: as an imperfect chord, imperfect concord, imperfect cadence, &c. always oppoſed to perfection. The bearings which temperament requires, and which every interval, except the octave will allow, without greatly offending the ear, occaſion *imperfect intervals.* See Interval and Temperament.

IMPARLANCE. See Emparlance.

IMPARSONEE, in *Law*, is applied to a parſon that is inducted, and in poſſeſſion of a benefice.

IMPARTITO, *Ital.* is ſaid of the ſolution of a canon, when it is written in ſcore, or drawn out in different parts;

in oppoſition to *canone chiuſo*, or a canon wrapt up in myſtery.

IMPASSIBLE, that which is exempt from ſufferings; or which cannot undergo pain, or alteration.

The Stoics place the ſoul of their wiſe man in an impaſſible, imperturbable ſtate. See APATHY.

IMPASTATION, the mixture of divers materials of different colours and conſiſtencies, baked or bound together with ſome cement, and hardened either by the air, or fire.

IMPASTATION is ſometimes uſed for a ſort of maſon's-work, made of ſtucco, or ſtone ground ſmall, and wrought up again, in manner of a paſte.

Authors are of opinion that the obeliſks, and the huge antique columns ſtill remaining, were made, ſome by impaſtation, and others by fuſion; but this is wholly erroneous; they are all cut out of quarries, yet open in Egypt, Arabia, &c.

IMPASTING, in *Painting*. See EMPASTING.

IMPATIENS, in *Botany*, is a genus ſo named from the great elaſticity of the ſutures of its ſeed-veſſels, which is completely impatient of the touch, curling up with the greateſt velocity, and ſcattering round the ſeeds, the inſtant any extraneous body comes in contact with it. From this remarkable circumſtance it has obtained the Engliſh appellation of "Touch me not." Linn. Gen. 458. Schreb. 597. Willd. Sp. Pl. v. 1. 1173. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 243. Ait. Hort. Kew. v. 3. 292. (Balſamina; Juſſ. 270. Tournef. t. 235. Gærtn. t. 113.)—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Corydales*, Linn. *Gerania*, Juſſ.

Gen. Ch. *Cal.* Perianth very ſmall, of two roundiſh, pointed equal leaves, placed towards the ſides of the flower, coloured, deciduous. *Cor.* Five-petalled, irregular; the upper petal roundiſh, flat, ſlightly trifid, making a ſort of upper lip; lower pair very large, obtuſe; intermediate pair oppoſite, riſing from the baſe of the upper petal; nectary receiving, like a hood, the baſe of the flower. *Stam.* Filaments five, very ſhort, narrower towards the baſe, incurved; anthers five, connate, divided at the baſe. *Piſt.* Germen ſuperior, ovate-acuminate; ſtyle none; ſtigma ſimple, ſhorter than the anthers. *Peric.* Capſule one-celled, five-valved, burſting longitudinally and with great elaſticity, the valves rolling ſpirally. *Seeds* ſeveral, roundiſh, fixed to a columnar receptacle.

Eſſ. Ch. Corolla of five petals, irregular, with an hooded nectary. Anthers ſlightly connected. Capſule ſuperior, of five elaſtic valves. Calyx of two leaves.

Obſ. The anthers being united induced Linnæus and many other authors to refer this genus to *Syngeneſia Monogamia*; but ſince the abolition of that order from the Linnæan ſyſtem, it of courſe belongs to *Pentandria Monogynia*. In ſome ſpecies the middle petals are wanting, and in ſome the horn of the nectary. The capſule differs in figure; hence the *Impatiens* of Rivinus had a long capſule, and his *Balſamine* an ovate one.

1. I. *Noli me tangere*. Yellow balſam, or Touch me not. Linn. Sp. Pl. 1329. Engl. Bot. t. 937. "Flower-ſtalks ſolitary, bearing many flowers. Leaves ovate. Joints of the ſtem ſwelling."—Not unfrequent in the northern parts of England and Wales, particularly in the neighbourhood of the lakes of Cumberland, flowering in Auguſt.—*Root* fibrous, ſmall, ſpreading horizontally. *Stem* ſolitary, erect, about two feet high, ſucculent, pellucid, ſmooth and poliſhed. *Leaves* alternate, on foot-ſtalks, ovate, obtuſe, ſerrated, the lower ſerratures briſtly; Villars remarks they become flaccid and as if withered in the night, but this is not always the caſe. *Flower-ſtalks* axillary and branched, bearing three or four yellow, pendulous *flowers*, dotted with red internally. *Nectary* funnel-ſhaped, with a recurved top. *Capſule* oblong, gibbous, pendulous; its valves ſo elaſtic that they burſt and ſcatter the *ſeeds* before the capſule is ripe. Hence the Latin names of "Impatiens" and "Noli me tangere;" and the Engliſh names of "Quick in hand," alive, as it were, in the hand. Gerarde calls it "Codded Arſmart," and Parkinſon, "Wild Mercury." The elaſticity of the ſeed-veſſel has furniſhed names in moſt of the European languages. In the day time the leaves are expanded, but at night they hang pendant, contrary to what is obſerved in moſt plants which, from a deficiency of moiſture, or a too great perſpiration from heat, commonly droop their leaves during the day. This plant was formerly conſidered as diuretic and vulnerary, and was given to relieve the hæmorrhoids and the ſtrangury. Boerhaave regarded it as poiſonous. It is now conſigned wholly to the flower-garden, where, however, it is not often ſeen. It is the only ſpecies of impatiens wild in Europe. It is alſo found in Canada. With us, it occurs in Wales and the northern counties of England, in moiſt ſhady places, and by the banks of rivulets. It flowers in July and Auguſt.

We have deſcribed the only Britiſh ſpecies of this ſingular genus. Willdenow enumerates twelve ſpecies, which, like the ſeven Linnæan ones, are divided into ſuch as have ſingle-flowered peduncles, and ſuch as have many flowers on each ſtalk, in which latter diviſion the *Noli me tangere* occurs.

The ſeeds of theſe plants ſhould be ſown on a moderate hot-bed in the ſpring, and when the plants are an inch high, they ſhould be tranſplanted on another hot-bed at about four inches diſtant each way, ſhading them from the ſun till they have taken new root; after which free air ſhould be copiouſly admitted to them, when the weather is favourable, and they ſhould be often refreſhed with water. When they are ſo large as to touch each other, they ſhould be taken up with balls of earth to their roots, and each planted in a ſeparate pot filled with light rich earth, and plunged into a very moderate hot-bed under a deep frame, ſhading them from the ſun till they have taken freſh root. They ſhould then be accuſtomed to bear the open air, into which part of the plants may be removed in July, placing them in a warm ſituation; where, in a favourable ſeaſon, they will flower and make a fine appearance. But part ſhould be kept in a glaſs caſe or deep frame, in order to get good ſeeds. Thoſe who are curious to preſerve theſe plants in perfection pull off all the ſingle and plain coloured flowers from the plants which they preſerve for ſeeds, leaving only thoſe flowers which are double, and of good colours: and thus they may be continued without degeneracy.

IMPEACHMENT, from the Latin, *impetere*, to *ſet upon*, or *attack*; or rather from the French, *empecher*, to *hinder*, in *Law*, is the accuſation and proſecution of a perſon for treaſon, or other crimes and miſdemeanors. Any member of the lower houſe of parliament may impeach any one belonging either to that body or the houſe of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. Theſe articles are carried to the lords, by whom every perſon impeached by the commons is tried; and if they find him guilty, no pardon under the great ſeal can be pleaded to ſuch an impeachment. (12 & 13 Will. III. c. 2.) A commoner cannot, however, be impeached before the lords for any capital offence, but only for high miſdemeanors. A peer may be impeached for any crime; the articles of impeachment are a kind of bills of indictment, found by the houſe of commons, and afterwards tried by the lords, who, in caſes of miſdemeanors, are conſidered not only as their own peers, but as the peers of the whole nation. This cuſtom is derived from the conſtitution of the ancient Germans, who, in their great councils, ſometimes tried capital accuſations relating to the public: "licet apud concilium, accuſare quoque, et diſcrimen capitis intendere." Tacit. de Mor. Germ. 12. Blackſt. Com. vol. iv

Impeachment *of Waſte*, a reſtraint from committing of waſte upon lands and tenements; or a demand of recompence for waſte made by a tenant who has but a limited eſtate in the land granted.

He that hath a leaſe without impeachment of waſte, hath by that a property or intereſt given him in the houſes and trees, and may make waſte in them without being called to an account for it. See Waste.

IMPECCABILES, in *Church Hiſtory*, a name given to thoſe heretics, who boaſted that they were impeccable, and that there was no need of repentance; ſuch were the Gnoſtics, Priſcillianiſts, &c.

IMPECCABILITY, the ſtate of a perſon who cannot ſin: or a grace, privilege, or principle which puts him out of a poſſibility of ſinning.

IMPEDIMENTS, in *Law*, are ſuch hindrances as put a ſtop or ſtay to a perſon's ſeeking for his right by a due courſe of law. Perſons under impediments are thoſe under age, or coverture, *non compos mentis*, in priſon, beyond ſea, &c. who, by a ſaving in our laws, have time to claim, and proſecute their rights, after the impediments are removed, in caſe of fines levied, &c.

Impediments *of Marriage*. See Marriage.

IMPEDIT, in *Law*. See Quare *Impedit*.

IMPENETRABILITY, a quality whereby a thing becomes unable to be pierced or penetrated; or a property of body whereby it fills up certain ſpaces, ſo that there is no room in them for any other body.

IMPENITENCE, or Impenitency, an hardneſs of heart, which makes a perſon perſevere in vice, and prevents his repentance.

IMPERATIVE, in *Grammar*, is one of the moods or manners of conjugating a verb, ſerving to expreſs a commandment; as *go*, *come*, &c. The imperative, according to biſhop Wilkins, is one of the primary modes or moods, the indicative being the other: by this the ſpeaker expreſſes his will to him that has the thing in his power; namely, to his ſuperior by petition, to his equal by perſuaſion, and to his inferior by command; and the manner in which theſe affect the copula (be it ſo, or let it be ſo) is called the imperative mood, of which there are theſe three varieties. Wilkins's Real Character, part iii c. 5. The ſame diſtinction is obſerved by Mr. Harris, who makes the imperative mood a ſpecies of the requiſitive when applied to inferiors; but when pertaining to equals, or ſuperiors, it is a precative or optative. Hermes, p. 144. ed. 2d. See Mood.

In Hebrew, and other oriental languages, the future tenſe has frequently an imperative ſignification.

IMPERATOR, among the *Romans*, a title of honour given to generals after a victory; firſt by the acclamations of the ſoldiers, and afterwards confirmed by the ſenate. See Emperor.

IMPERATORIA, in *Botany*, is ſuppoſed to have derived its name from its reputed imperial virtues in medicine, whence alſo it has obtained with our herbaliſts the appellation of "Maſterwort."—Linn. Gen. 143. Schreb. 193. Willd. Sp. Pl. v. 1. 1458. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 327. Ait. Hort. Kew. v. 1. 358. Juſſ. 220. Lamarck Dict. v. 3. 242. Illuſtr. t. 199. Gærtn. t. 21. —Claſs and order, *Pentandria Digynia*. Nat. Ord. *Umbellatæ*, Linn. *Umbelliferæ*, Juſſ.

Gen. Ch. *Cal.* Umbel univerſal flat-ſpreading; partial unequal. *Invol. univerſal* none; *partial* very ſlender, with one or two leaflets, almoſt as long as the umbel. *Perianth proper* obſolete. *Cor. univerſal* uniform; *florets* all fertile: *partial.* Petals five, inflex-emarginate, nearly equal. *Stam.* Filaments five, capillary; anthers roundiſh. *Piſt.* Germen inferior; ſtyles two, reflexed; ſtigmas obtuſe. *Peric.* none. Fruit roundiſh, compreſſed; gibboſe in the middle, margined. *Seeds* two, ovate, marked on one ſide with two furrows, ſurrounded by a broad margin.

Eſſ. Ch. General Involucrum none. Flowers all fertile. Petals inflexed, notched, nearly equal. Fruit roundiſh, compreſſed, bordered, ſwelling in the middle, with three ribs. Umbels flat.

1. I. *Aſtruthium.* Maſterwort.—Linn. Sp. Pl. 371. Engl. Bot. t. 1380. Woodv. Med. Bot. t. 35.—Found by Mr. Lightfoot on the banks of the Clyde, and this is the only authority for its being added to the liſt of Britiſh plants.—It flowers in June.—*Root* perennial, tuberous, acrid and aromatic. *Stems* erect, about a foot and a half high, moſtly ſimple, round, ſtriated, ſmooth. *Leaves* twice ternate, ſmooth, acutely ſerrated and cut. *Umbels* terminal, of many rays, flattiſh, ſmooth. *Flowers* white or bluſh-coloured, regular. *Fruit* emarginate at the top and baſe, ſmooth.

Maſterwort has long been ſuppoſed a ſovereign remedy againſt poiſon. Gerarde ſays it is "alſo ſingular againſt all corrupt and naughty aire and infection of the peſtilence—cures peſtilential carbuncles and botches—cold fits of agues—dropſy—diſſolves all ventoſities or windineſſe of the ſtomache and other parts—and greatly helpeth ſuch as have taken great ſquats, bruiſes, or falls from ſome high place." This account of its virtues may lead us to ſuppoſe that this plant was conſidered by ancient botaniſts as the maſter-key of pharmacy.—At preſent it is occaſionally uſed as an aromatic, but is of courſe ſuperſeded by many plants which have that property in a ſuperior degree.

IMPERATRIX, a name given by ſome authors to the *Meum* or Spignel.

IMPERFECT Consonances, in *Muſic*. Sometimes the thirds and the ſixths are, though improperly, called imperfect conſonances, becauſe they are of two kinds, major and minor of each: while the fifth and fourth are ſaid by theſe writers to be perfect, becauſe they never change; which, however, is not correct, ſince there is the minor, falſe, or flat fifth, or ſemidiapente, and the major, falſe, or ſharp fourth, or tritone; and thus every note of the ſcale has its major and minor, as well as the thirds and ſixths. (See Interval.) Dr. Callcott recommends ſome further diſtinctions on this ſubject in his Muſical Grammar, art. 189, &c.

Imperfect *Chords*, or incomplete, are ſuch as do not include all their acceſſary ſounds.

Imperfect *Inſtruments*, are thoſe with a fixed number of notes or intervals in the octave, (leſs than 44, according to Maxwell,) as the common keyed-inſtruments with 12 ſounds, flutes, oboes, baſſoons, &c. and, in general, all ſuch whereon the performer has it not in his power to vary his ſounds, ſo as to produce perfect chords with other notes ſtruck or ſounded at the ſame time, a thing impoſſible throughout the 12 keys major and 12 minor, on any inſtrument which cannot command 44 different ſounds within the octave, according to Mr. Maxwell, or 60 at the leaſt, according to Mr. Henry Liſton. The imperfect inſtruments in common uſe, are incapable of executing any tempered ſyſtem of intervals except the iſſotonic, or equal temperament, ſo that every key therein ſhall be alike harmonious, becauſe wolves, bearing-notes, or intervals very different to what they are intended to be muſt occur, or be ſubſtituted for the proper ones, unleſs 21 ſounds at leaſt can be introduced into the octave, as was done by Dr. R. Smith on his harpſichords, or 24 notes, as is done on Mr. D'Loeſchman's patent pianofortes and organs for harmonizing 33 keys: we have already, under the article Hawke's *Temperament*, pointed out the impoſſibility of the 17 notes on that gentleman's patent inſtruments performing without wolves in more than 23 keys, while ſome of them are not the moſt uſual, or thoſe which firſt ariſe in the regular order of modulation: all theſe of 12, 14, at the Temple, 16 at the Foundling organ, 17, 21 and 24 notes, are imperfect inſtruments, and incapable of yielding perfect or untempered harmony in any piece of muſic. See Perfect Instruments.

Imperfect *Intervals*, are ſuch as have not a ratio expreſſible in ſmall or whole numbers: thus $\frac{3}{4}$, or the fourth, is a perfect interval, but $\frac{3 \cdot 2}{4 \cdot 3}$, or $\frac{32}{43}$, is not a perfect interval; but the falſe, or trumpet fourth, $\frac{3 \cdot 2}{4 \cdot 5}$, or $\frac{32}{45}$, is alſo an imperfect interval, the tritone. The tempered intervals, adapted to imperfect inſtruments, are imperfect intervals, whether ſuch deviate one or more of ſome ſmall interval from perfection, as $\frac{243}{320}$ the comma deficient fourth, $\frac{2187}{3200}$ the double comma deficient fifth, $\frac{16384}{19683}$ the ſchiſma-exceſſive minor third, &c.; or deviate any fractional part or parts of a ſmall interval from perfection, as $1 \div \sqrt[4]{5}$ a fifth flattened, $\frac{1}{4}$th of the major comma for the mean tone temperament, $\sqrt[3]{\frac{3}{10}}$ a fifth flattened $\frac{1}{3}$d of the major comma for a ſyſtem with perfect major ſixths, &c.

Imperfect *Plants*, among *Botaniſts*, are ſuch as either really want flower and ſeed, or are ſuppoſed to want them; no flower or ſeed having been diſcovered in the greater part of thoſe plants included in this claſs by the botanical writers, at the time when they were thus denominated. See Plants.

Imperfect *Mixts*. See Mixt.

Imperfect *Numbers*, in *Arithmetic*. See Numbers.

Imperfect *Tenſe*, in *Grammar*, ſignifies an indefinite time between the preſent and the paſt; as, *I taught*, *I heard*. The imperfect was ſometimes employed by the ancients to denote what is uſual and cuſtomary: thus *ſurgebat* and *ſcribebat* ſignify not only *he* WAS *riſing*, *he* WAS *writing*, but upon occaſion they ſignify, *he* USED *to riſe*, *he* USED *to write*. The reaſon of this is, that whatever is cuſtomary, muſt be ſomething which has been frequently repeated; but what has been frequently repeated muſt require an extenſion of time paſt. It was alſo uſed by the ancients, in which they have been followed by the moderns, in a ſuſpenſive kind of inſcription; as Απελλης εποίει, *Apelles faciebat*, but not ἐποίησε, or *fecit*; by which uſe of the imperfect they avoided the ſhew of ignorance, and had prepared an apology in caſe of cenſure, by ſaying that the work was *once indeed in hand*, without pretending that *it was ever finiſhed*. Harris's Hermes, p. 136, &c. See Tense.

IMPERFETTO, *Ital.* imperfect. See Interval.

IMPERFORATE Anus. It ſometimes happens, that infants are born with the anus imperforate, and when the defect is not ſoon diſcovered, and ſome endeavour made to obviate it, the conſequences are, in a ſhort time, almoſt invariably fatal. The afflicted infant is reſtleſs, cries much, and ſuffers a frequent and diſtreſſing inclination to empty the rectum. In the fits of ſuffering, the child's face ſwells, and its eyes become red, and more or leſs protruded from their ſockets. At length the belly is affected with a general ſwelling and tenderneſs, and death takes place in four or five days, either from the inflammatory and gangrenous miſchief within the abdomen, or from the convulſions excited. It is a very curious circumſtance, however, that there are caſes on record, where children have lived ſeveral weeks, and even years, with an imperforate anus, the excrement having been diſcharged all ſuch time by the mouth. (See Journal de Medécine, ann. 1770, p. 510, and tom. 8. p. 60.) Such inſtances, indeed, are exceedingly uncommon; but they are important, inaſmuch as they tend to evince, that the operation uſually performed for the relief of an imperforate anus, may be attempted, even at a late period, with a conſiderable chance of ſucceſs. When an infant labours under the above-mentioned complaints, and the meconium does not come away, the practitioner is naturally led to examine the appearance of the anus, and thus the nature of the caſe is detected.

There are various kinds of imperforate anus. Sometimes the termination of the rectum is ſhut up by a preternatural membrane, or thin portion of ſkin. This is the moſt common, and, at the ſame time, the moſt favourable caſe, both the diagnoſis and treatment being free from all difficulty. The membrane, ſhutting up the anus, is plainly viſible to the practitioner immediately upon his making the requiſite examination, and, occaſionally, it is ſo diſtended with the confined feces, that it projects from the anus in the form of a pouch or ſac. Here the proper method is to divide the membrane with a biſtoury, and if the part compoſing the obſtruction is thick, the inciſion may be made in a crucial ſhape, and four angles, or flaps, cut away with the knife or ſciſſors. Dreſſings and bandages are not required after the operation, the exit of the excrement and air prevents a cloſure of the opening; and it ſeldom happens that any ſymptoms ariſe deſerving particular notice.

Sometimes the lower end of the rectum is properly formed and open; but the inteſtine is inwardly cloſed at a greater or leſſer diſtance above the anus. Such imperviouſneſs is alſo occaſionally produced by a preternatural membrane; though, in ſome caſes, it is the effect of an adheſion of the ſides of the bowel together, there being, in fact, a total obliteration of the cavity of the inteſtine at the part which is impervious. When the obſtruction happens to be ſituated a very little above the anus, it may eaſily be felt by the finger; but when it occurs ſo high up, that the finger cannot reach it, the caſe may be ſet down as irremediable. That a part of the rectum is impervious, may be inferred from the infant's having no ſtools, and from the immediate diſcharge of clyſters, whenever given to promote the paſſage of the excrement. In this circumſtance, how can we venture to introduce any inſtrument, with a deſign of perforating the obſtruction, without having the guidance of the finger, and without being able to know whether we are piercing the part compoſing the obſtruction, or wounding the ſide of the bowel? Whether, in ſo hopeleſs a caſe, it is proper to attempt the formation of an artificial anus, will be preſently conſidered.

When the obſtruction can be felt with the finger an operation is admiſſible, and it may be moſt conveniently performed with the pharyngotomus introduced on the finger. A large curved trocar might alſo anſwer the purpoſe; but the operation is neither free from difficulty nor danger. In the event of the part of the inteſtine above the obſtruction being greatly diſtended with feces, a kind of fluctuation is ſometimes not only perceptible above the impervious place, but likewiſe through the coats of the bowel at the circumference of the obſtruction; and in this caſe it is often exceedingly difficult to diſtinguiſh the exact ſituation into which the inſtrument ought to be puſhed, ſo as to form a communication between the upper and lower portion of the inteſtine. Should the puncture be made in a wrong direction, the ſide of the bowel would be wounded, and a fatal extravaſation of its contents into the pelvis be the conſequence. A miſtake of this ſort would be the moſt difficult to avoid, were the inteſtines cloſed by a membrane of a thickiſh firm texture; for then the fluctuation of the fecal matter would be leſs plain, juſt in the ſituation of the obſtruction, than at the circumference. On the other hand, when the membrane, rendering the bowel impervious, is very thin, the fluctuation of the inteſtinal matter may be eaſily felt through it, and the practitioner has leſs difficulty in determining where the perforation ought to be made. When the imperviouſneſs of the bowel is the effect of an accretion of its ſides together, and the inteſtinal canal is quite annihilated at the part, the fluctuation of the inteſtinal matter is leſs plain in the ſituation of the obſtruction than at the ſides of it, and indeed may be quite imperceptible. In all ſuch caſes the operation cannot fail to be attended with conſiderable peril, as every thing depends upon the direction in which the inſtrument is introduced, which direction ſhould be ſuch as will open a communication between the upper and lower portions of the inteſtine, and can only be aſcertained with difficulty. When the membrane that has been pierced is thin, no particular dreſſings are needed after the operation, the opening being more likely to be widened by the paſſage of the inteſtinal contents than to cloſe again; but if the puncture has been made through a thick ſubſtance, ſurgical authors recommend a tent, or piece of a thick bougie, to be occaſionally worn for ſome time after the operation, in order to prevent the opening from becoming ſhut up again.

In certain examples not the ſlighteſt appearance nor veſtige of an anus can be diſcovered, the rectum terminating in a cul-de-ſac. Here the operation is attended with ſeveral difficulties, and the event is therefore generally fatal. The greater or leſſer diſtance of the cul-de-ſac extremity of the rectum from the external integuments, however, is a circumſtance making a material difference in the degree of hazard. The practitioner cannot aſcertain this point unleſs the contents of the bowel happen to lie ſo near the ſkin as to communicate to the fingers of an examiner the feel of fluctuation. When this is the caſe the operation is eaſy of performance, and the conſequences for the moſt part ſucceſsful. The further the inteſtine is ſituated from the integuments, the ſmaller is the chance of being able to ſave the infant's life. When the end of the bowel lies very high up it may be impoſſible to reach and open it with a cutting inſtrument. Sometimes the rectum is entirely wanting, and the colon terminates in a cul-de-ſac.

A more favourable caſe is met with where nature indicates the place in which the opening of the anus ought to be, by a red depreſſion, ſmall folds and wrinkles, or ſome ſuch appearance. But, in many inſtances, the part is every where ſo even and uniform, that there is nothing to point out where the inciſion ought to be made. Here the knowledge of anatomy is the only light to the practitioner. He makes the firſt cut through the ſkin, between the os coccygis and the beginning of the raphe of the perineum. He is to recollect, however, that in new-born infants the lower end of the rectum is not ſo cloſe to the os coccygis as in adult ſubjects. An interſpace, of nearly an inch, ought therefore to be left between the point of this bone and the poſterior extremity of the inciſion. In male infants it is as well to introduce a catheter into the bladder before the operation. By this means the ſurgeon will not only be enabled to determine with greater preciſion the place of the firſt inciſion, but alſo to avoid the urethra as the wound is gradually made deeper. Surgical writers think it advantageous to make a crucial inciſion in the ſkin and ſubjacent cellular ſubſtance.

The firſt wound is to be gradually rendered deeper, care being taken to direct each ſtroke of the knife with the fore-finger of the left hand. The principal objects in view are to avoid the urethra and bladder, and find out the end of the rectum. An injury of the urethra may eaſily be avoided, when care is taken to introduce a catheter before the operation, and to feel the inſtrument repeatedly with the left hand during the employment of the knife. Sometimes the rectum is ſo diſtended with its contents as to preſs upon the neck of the bladder, and occaſion a retention of urine. Here the dilated bladder might eaſily be wounded, were the ſurgeon, before the operation, to neglect to introduce a catheter, and draw off the urine. The ſurgeon is occaſionally directed to the cul-de-ſac termination of the bowel by the fluctuation of the accumulated feces; ſometimes by a certain hardneſs which he perceives at the bottom of the wound; and which is produced by the ſphincter muſcle in a ſtate of contraction. When there are no marks of this kind to guide him, nothing will be of any uſe to him except anatomical knowledge, and the rule always to incline the inciſion towards the os ſacrum, where no important parts can be injured, inſtead of forwards, where the bladder, or vagina, is ſituated.

At length, the ſurgeon either ſucceeds in finding out the end of the inteſtine, or elſe his endeavours prove ineffectual, although the wound has already been carried to a reaſonable depth. When the extremity of the bowel is found, the infant is indeed relieved for the preſent, but it is far from being out of danger. Experience proves that the majority of children die after this operation. The cauſes of this fact may be various; but, probably, it often happens that the ſide of the inteſtine is cut, and that an extraſation of the inteſtinal matter in the pelvis enſues. In the event of the bowel being found, the ſurgeon can do nothing more than make as capacious an opening in it as can be done with ſafety, promote the evacuation of the feces by gentle aperients, and place a tent in the wound in order to keep the new outlet pervious. The tent is always productive of irritation and pain, and conſequently it ſhould conſtantly be as ſoft and flexible as poſſible. A flexible tube is by no means an eligible inſtrument for introduction; for, if it ſhould be too ſmall, the ſtools would not paſs through it; and, if too large, it would give riſe to pain and inflammation. Even when the operation is followed by favourable conſequences, an involuntary diſcharge of the feces frequently continues. Caſes, however, do occur where the cure is in every reſpect perfect, the infant emptying its bowels naturally, and under the controul of the will.

When the ſurgeon has carried the inciſion to a conſiderable depth, and cannot meet with the bowel, ought he to venture to cut ſtill more deeply? The attempt, it muſt be confeſſed, is attended with ſome danger, and is uncertain in its conſequences; but as death is inevitable if no outlet for the feces can be procured, circumſtances ſeem to juſtify ſuch an endeavour to preſerve the child. The occaſional ſucceſs, alſo, which has attended the proceeding, further corroborates its propriety. After extending the inciſion to the depth of two inches, without finding the inteſtine, a trocar, introduced an inch more deeply, has ſucceſsfully opened the bowel. If, in ſuch a caſe, the ſurgeon were to uſe a trocar, with a ſlit cannula, the puncture might be immediately dilated with a biſtoury paſſed into the tube.

When the rectum cannot be found and opened in the foregoing manner, Littre has propoſed making an opening into the abdomen near the left groin, dividing the ſigmoid flexure of the colon, attaching the opened portion to the external wound, and thus eſtabliſhing an artificial anus. This operation has not only been found very practicable upon the dead ſubject, but has actually been performed by Sabatier, Lehrbuch, &c. upon living infants with the happieſt conſequences. It is not to be diſſembled, however, that the event is exceedingly doubtful, eſpecially as the practitioner can never know beforehand how far the large inteſtines may be cloſed, or where the cul-de-ſac extremity lies; but, upon the whole, the operation certainly appears to be warrantable, not merely on account of the hopeleſs condition of the infant, but becauſe the attempt has unqueſtionably been known to ſucceed.

Calliſen has propoſed ſearching for the deſcending colon in the region of the loins. For this purpoſe he recommends an inciſion to be made on the left ſide of the ſpine, between the falſe ribs and the criſta of the os ilium, upon the front edge of the quadratus lumborum muſcle. It muſt be acknowledged, that in this ſituation there is more chance of finding the inteſtinal canal pervious; and that here an apparatus for leſſening the inconveniencies of an artificial anus admits of being more conveniently applied. But, all things conſidered, this operation is liable to more objections than the method propoſed by M. Littre, which has likewiſe the important recommendation of having already proved ſucceſsful.

Sometimes, beſides the anus being imperforate, the large inteſtine has a preternatural opening into the urethra, or bladder. In female infants ſuch a malformation is leſs pernicious in its conſequences than in male children. In the former the meatus urinarius is ſhort and dilatable, and the feces find a ready outlet; in the latter death uſually enſues, unleſs an opening be ſpeedily made for the paſſage of the excrement in the natural ſituation of the anus. Even when this has been executed, all the danger is not over; for it does not follow, as a matter of courſe, that the preternatural opening in the gut will cloſe, becauſe a new outlet has been formed. However, there are caſes on record proving that this beneficial change may happen. Sometimes the preternatural opening in the inteſtinal canal is ſituated in the vagina or at the navel, in which circumſtances external means may be employed to promote the cloſure. There are likewiſe caſes recorded by writers, where women have diſcharged their feces, during the whole of their lives, through the vagina, or bladder.

In certain inſtances the anus is not cloſed, but only very ſmall. This ſtate is ſometimes an original malformation. In other examples it ariſes after birth from a variety of cauſes, as after the operation for the fiſtula in ano, &c. The caſe may be cured, or at leaſt relieved, by dilating the opening on each ſide with a biſtoury, and employing tents.

Perhaps the moſt important caſe of impervious rectum is that which proceeds from a ſcirrhous induration and thickening of the coats of that inteſtine. Such diſeaſe is moſtly ſeen in perſons rather advanced in life, and more frequently in women than men. It ordinarily begins in a ſlow and inſidious manner, producing at firſt ſeveral complaints, which are apt to be imputed to other cauſes, eſpecially to piles. The caſe in the early ſtage is, therefore, in general not much underſtood. The patient feels an inclination to go to ſtool; but he voids little, and what comes away paſſes with great difficulty. He uſually ſuffers ſhooting pains about the rectum; and the agony is often ſo ſevere, particularly when the patient is at ſtool, as to induce fainting. The excrement which comes away is remarkably thin. As the diſeaſe advances, the rectum at length becomes quite impervious, and a miſerere then comes on, which commonly proves fatal, as a free paſſage for the feces can ſeldom be procured again with ſufficient celerity. The induration occaſionally ulcerates, and the neighbouring parts are deſtroyed in various ways.

The diſeaſe may be detected by proper examination, in which the rectum will be found to be hard and contracted. Sometimes, on its inner ſurface, hard lumps and furrows can be felt. The more ancient and conſiderable the hardneſs is, the more difficult is the cure. The colon is liable to be thus rendered impervious, in which circumſtance the caſe is fatal. (See Mem. of the Med. Society of London, vol. ii.) The coats of the rectum have been found an inch thick, and quite cartilaginous.

Tents are the principal means of relieving the ſcirrho-contracted rectum, juſt in the ſame manner as bougies are calculated for the cure of ſtrictures in the urethra. Large bougies, made for the purpoſe, might alſo anſwer beſt for the dilatation of the rectum. But whatever inſtrument is uſed, its ſize muſt be gradually augmented. The paſſage of the ſtools is every day to be facilitated with clyſters. Several kinds of medicines have been tried internally, as cicuta, mercury, burnt ſponge, &c. Deſault found the mineral alkali very efficacious, ſo much ſo, that he ſometimes effected a complete cure in the ſpace of from three to ſix months, even though the diſeaſe had fallen into the ulcerated ſtate. The medicine, however, muſt always be continued, till the diſeaſe is entirely removed; for when the treatment is diſcontinued too ſoon, the diſorder is apt to recur. Sometimes it is neceſſary to uſe the knife, that is, when an indurated tranſverſe fold is formed in the rectum, ſo as both to hinder the paſſage of the excrement, and the introduction of the tent or bougie. Richter's Anfangſgründe der Wundarzneykunſt, Band 6. Kapitel 19.

Imperforate *Meatus Auditorius.* See Meatus *Auditorius.*

IMPERIAL, ſomething belonging to an emperor, or empire.

Thus we ſay, his imperial majeſty, the imperial crown, imperial medals, the imperial chamber.

Imperial *Cities*, in Germany, are thoſe which own no other head but the emperor.

Theſe are a kind of little commonwealths; the chief magiſtrate whereof does homage to the emperor, and pays him the Roman month; but in other reſpects, and in the adminiſtration of juſtice, the magiſtrate is ſovereign. The imperial cities have a right of coining money, and of keeping forces, and fortified places: their deputies aſſiſt at the imperial diets, where they are divided into two branches; that of the Rhine, and that of Suabia. There were formerly twenty-two in the former, and thirty-ſeven in the latter; but there are now only forty-nine in all; thirteen belonging to the former, and thirty-ſix to the latter.

Imperial *Diet*, is an aſſembly or convention of all the ſtates of the empire. See Diet.

Imperial *Table*, in *Surveying*, an inſtrument made of braſs, with a box and needle, ſtaff, &c. uſed in meaſuring land.

IMPERIALE, in *Geography*, a town of Chili, ſituated on a river which runs into the Pacific ocean; deſtroyed by the Indians; 60 miles N. of Valdivia.

IMPERII Recessus. See Recessus *Imperii*.

IMPERSONAL Verb, in *Grammar*, is ſuch an one, as is only uſed in the third perſon ſingular; as *oportet*, *licet*, &c. Every verb, ſays the ingenious Mr. Harris, whether active or paſſive, has in language a neceſſary reference to ſome noun for its nominative caſe; and the doctrine of imperſonal verbs has been juſtly rejected by the beſt grammarians, both ancient and modern. Hermes, p. 175.

IMPERVIOUS, a thing not to be pervaded, or paſſed through; either by reaſon of the cloſeneſs of its pores, or the particular configuration of its parts.

IMPETIGO, in *Medicine*, a term which has been employed in many indefinite ſignifications by writers in the Latin language. Pliny uſes it as ſynonymous with the *Lichen* of the Greeks (Nat. Hiſt. lib. xx. cap. 1.), in which he is followed by the majority; he is, however, inconſiſtent with himſelf, ſince, on other occaſions, he employs the term to expreſs other diſeaſes. The definition which Celſus gives of *Impetigo*, does not in any reſpect correſpond with the deſcription of the *Lichenes* given by the Greeks: he includes theſe diſtinctly and correctly under the head of *Papula*; and his *Impetigo*, as Sennertus remarks, is the *Lepra* of the Greeks (Celſ. de Medicinâ, lib. v. cap. 28. Sennert. Med. Pract. lib. v. cap. 30. Willan on Cutaneous Diſeaſes, part i. p. 38.) Sauvages and Cullen have adopted the term *impetigo* for the title of one of the orders in their reſpective ſyſtems of noſology, in the claſſes of *Cachexiæ*. The *Impetigines*, in Dr. Cullen's ſyſtem, include thoſe ſpecies of cachectic diſeaſes, which particularly diſcolour and deform the ſkin and external parts of the body; namely, ſcrofula, ſyphilis, ſcurvy, elephantiaſis, leproſy, jaundice, &c. (Claſs IV. Ord. III.) The *Impetigines* of Sauvages include only thoſe chronic and commonly contagious diſeaſes which are accompanied by cluſtered ſwellings, ulcerations, cruſts, &c.; *viz.* ſyphilis, ſcurvy, elephantiaſis, lepra, ſcabies, and tinea. Claſs X. Ord. V.

Dr. Willan confines the uſe of the term *impetigo*, as a genus to a *puſtular* eruption, commonly occurring in patches, and diſcharging a fluid, which, under one or two of its varieties, forms cruſts or ſcabs on the ſurface; the running tetter of authors. But as the part of his treatiſe of cutaneous diſeaſes, which will contain the deſcription of impetigo, is not yet publiſhed, we are unable to enter farther into his views of the ſubject at preſent.

IMPETRATION, the act of obtaining any thing by requeſt or prayer.

Impetration was more particularly uſed in our ſtatutes for the pre-obtaining of benefices and church offices in England from the court of Rome, which did belong to the diſpoſal of the king, and other lay patrons of the realm; the penalty whereof is the ſame with that of proviſors, 25 E. III. See Provisor.

IMPETUS, in *Mechanics*. See Force, Momentum, and Motion.

Impetus, *Paracentric*. See Paracentric.

IMPEY's Island, in *Geography*, a ſmall iſland in the Mergui Archipelago. N. lat. 10° 22′.

IMPEZZATO, *Ital.* See Epais and Spissus.

IMPING, in *Falconry*, the inſerting a feather in the wing of a hawk, in the place of one that is broken.

IMPIRA, in *Geography*, a town of South America, in the province of Cordova; 90 miles S. of Cordova.

IMPLANTATION. See Transplantation.

IMPLEAD, to ſue, or proſecute by courſe of law. See Pleading.

IMPLEMENTS, formed either from the Latin, *implere*, *to fill up*; or from the French, *imployer*, *to employ*; is uſed for all things neceſſary for a trade, or the furniture of a houſehold.

In this ſenſe we frequently find it uſed in wills, and conveyances of moveables.

IMPLEMENT, in *Agriculture*, a term applied to any ſort of tool or inſtrument by which any kind of work is executed.

Implements *of Huſbandry*, the ſeveral different kinds of tools or machinery by which the various ſorts of labour and operations of the art are performed. They conſiſt principally of ſpades, ploughs, harrows, drags, drills, hoes, mills, carts, waggons, &c. See theſe different heads.

In the formation and conſtruction of all ſorts of tools and machinery for the uſes of the farmer, the principal aim ſhould be that of rendering the work they are to perform more cheap, eaſy, expeditious, and complete, by having them perfectly ſuited to the operations for which they are intended, and at the ſame time not too weighty, while they poſſeſs ſufficient degrees of ſtrength for the different purpoſes to which they may be applied. It is conceived by a late writer on rural affairs, that there is probably no ſort of implements that admits of greater improvement than thoſe employed in huſbandry, on the principle of leſſening weight, without materially diminiſhing the ſtrength. It is ſtrongly obſerved, that "every one knows that, if a beam of any length be made of equal thickneſs throughout its whole length, and a weight ſufficient laid upon it, it will inevitably break in the middle, and never at either of the ends; yet, unleſs it be in the poles of a ſedan chair, an inſtance can ſcarcely be recollected, in which weight has been diminiſhed on this principle. On the contrary, it is not at all unuſual, in the conſtruction of ſuch implements, to ſee the thickneſs diminiſhed nearly one-half at the very weakeſt place, by means of a mortiſe cut out of it there, while its thickneſs in other parts is four times greater than would enable it to bear an equal burden. No attention is paid in placing the wood in that poſition wherein it would be beſt able to reſiſt the preſſure to which it muſt neceſſarily be ſubjected; although it is very well known that the ſame quantity of materials may be made to bear in one poſition above ten times as much as it could do in another. It is well known that mortiſes weaken the wood to an aſtoniſhing degree when they are injudiciouſly placed; yet it is no uncommon thing to ſee two croſs-mortiſes, each of them twice the ſize that in any caſe could have been neceſſary, made through a beam, perhaps at the very weakeſt part of it, juſt as accident may direct, without even ſo much as an attempt to vary their poſition, far leſs to wholly avoid them, which in many caſes might be effected without the leaſt inconvenience or impropriety.

It is well underſtood, that a ſmall brace, judiciouſly made uſe of, may greatly augment the ſtrength without adding to the weight of an implement; yet contrivances of this nature, which are obvious to the mereſt tyro in mechanics, ſeem to be totally diſregarded: far leſs do the conſtructors of ſuch tools think of adopting new devices of this deſcription, which a very moderate degree of ingenuity would readily point out. The importance and advantages of having every part firm and compact in a tool which is to be ſubjected to jolting and ſhaking, are univerſally recognized; yet, from the moſt trifling conſiderations, this principle may be ſeen departed from, and loads of ſuperfluous materials added in vain to ſupply the defects that are in this way produced. And theſe remarks do not apply to one ſet or ſort of implements only, but almoſt to every common tool or machine that is employed in the art of huſbandry.

It is obvious, that theſe principles and circumſtances, however evident in themſelves, have not only been little attended to by the cultivators of the ſoil, but in a great meaſure overlooked by thoſe who have been chiefly engaged in the making of tools of this deſcription. It can ſcarcely have eſcaped obſervation that, in moſt of the diſtricts of the country, though numerous uſeful tools and machines have been lately invented and improved, there are ſtill various kinds to be met with, which are not only extremely inconvenient from their clumſineſs, but employed with great diſadvantage in conſequence of their heavineſs. A difference, however, in regard to ſtrength, as well as other objects, becomes neceſſary ſometimes from the nature of the ſituation and other circumſtances, and by theſe the mechaniſt muſt frequently be directed in conſtructing theſe ſorts of tools. And as implements of this kind are generally made uſe of by labourers who have but little knowledge of the nature, power, and operation of them, they ſhould conſtantly be conſtructed on the moſt obvious and ſimple principles, as well as in ſuch modes, and of ſuch materials, as that they may be afforded at an eaſy rate; as where they are charged at a high price, it muſt of neceſſity operate greatly againſt their introduction into general uſe.

The deſcriptions of the ſeveral different implements and machines that are capable of being employed with advantage in the various departments of agriculture, may be ſeen under the different heads to which they properly belong.

IMPLEX ACTION. See ACTION.

IMPLICATION, in *Law*, is where the law doth imply ſomething that is not declared between parties in their deeds and agreement; and when our law giveth any thing to a man, it giveth implicitly whatever is neceſſary for the enjoying the ſame. The want of words may be helped in ſome caſes by implication; and ſo one word or thing, or one eſtate given, ſhall be implied by another: and there is an implication in wills and deviſes of land, whereby eſtates are gained.

IMPLICIT, derived from *in*, and *plico*, *I fold*; ſomething tacitly comprized, or underſtood: that is, contained in a diſcourſe, clauſe, or propoſition, not in expreſs terms, but only by induction and conſequence.

IMPLICIT *Faith*. See FAITH.

IMPLIED *Condition*, *Contract*, *Malice*, and *Warranty*. See the ſubſtantives.

IMPLIED *Sound*, in *Muſic*, is a term uſed by Mr. Holder in his "Eſſay towards a rational Syſtem of Muſic," p. 350. 362. 370, &c., to expreſs what he thought to be the grave harmonic of certain ſounds, but owing to a falſe rule by which he calculated, many of theſe are no ſuch things as the Tartinian ſounds he ſuppoſed them to be, and many parts of the fanciful theory which he raiſes therefrom, are, as might be expected, at variance with all eſtabliſhed facts and rules in harmonics. See our article GRAVE *Harmonic* and HOLDER'S *Temperament* of the muſical ſcale.

IMPLY *a contradiction*, a phraſe uſed among philoſophers in ſpeaking of the object of divine omnipotence.

God can do every thing that does not imply a contradiction proceeding from God: by which is not meant a relation of the action to the executive power of God, but a relation to the other attributes and ſimple perfections of God.

IMPONDERABLE SUBSTANCES, in *Chemiſtry*. Inſtead of conſidering repulſion as a general agency or force, philoſophers, finding that the cauſe producing it is capable of being communicated from one body to another, and that ſome of the phenomena of its tranſition indicate it to be a diſtinct principle, have been diſpoſed to regard it as a peculiar ſubtle kind of matter, the ſame with that to which the phenomena of heat have been referred, and which, in the modern chemical nomenclature, has been denominated *Caloric*, which ſee. Though the materiality of this power has not been demonſtrated, the ſuppoſition has much probability, and accords nearly with the phenomena. It may be regarded as the cauſe of repulſion, whatever be the nature of this power, whether it be regarded as a quality of bodies, a general force, or a diſtinct kind of matter; the ſame principle which produces the phenomena of heat is undoubtedly that which counteracts the attractions exerted between the particles of bodies. The connection of light and heat has led to the opinion of their identity; it is well aſcertained that the particles of light are mutually repellent. From heat and light there is a natural tranſition to the agent which gives riſe to the phenomena of *Electricity* and *Galvaniſm*, which ſee. They all poſſeſs one common character, which is that of not being ſubject to the attraction of gravitation, or at leaſt their gravity is incapable of being appreciated: hence they are diſtinguiſhed by the name of "imponderable ſubſtances." They poſſeſs the greateſt ſubtilty or tenuity: we cannot eaſily inſulate or obtain them in a ſeparate ſtate of exiſtence: they are obſerved only in ſtates of combination, or in their rapid tranſition from one body to another: we can ſcarcely meaſure their force, and we are unable to trace their particular combinations, or conſider them as eſſential conſtituent principles of any compound.

IMPORTANCE *of Action*, in *Poetry*. See ACTION.

IMPORTATION, the act of importing or bringing merchandize from foreign countries, in contradiſtinction to exportation.

IMPOSITION *of Hands*, an eccleſiaſtical action, by which a biſhop lays his hands on the head of a perſon, in ordination, confirmation, or in uttering a bleſſing. This practice is alſo frequently obſerved by the Diſſenters at the ordination of their miniſters, when all the miniſters preſent place their hands on the head of him whom they are ordaining, while one of them prays for a bleſſing on him and his future labours. This ſome of them retain as an ancient practice, juſtified by the example of the apoſtles, when no extraordinary gifts were conveyed. However, they are not agreed as to the propriety of this ceremony; nor do they conſider it as an eſſential part of ordination.

Impoſition of hands was a Jewiſh ceremony, introduced, not by any divine authority, but by cuſtom: it being the practice among thoſe people, whenever they prayed to God for any perſon, to lay their hands on his head.

Our Saviour obſerved the ſame cuſtom, both when he conferred his bleſſing on children, and when he cured the ſick; adding prayer to the ceremony. The apoſtles likewiſe laid hands on thoſe upon whom they beſtowed the Holy Ghoſt. The prieſts obſerved the ſame cuſtom when any one was received into their body. And the apoſtles themſelves underwent the impoſition of hands afreſh, every time they entered upon any new deſign. In the ancient church, impoſition of hands was even practiſed on perſons when they married; which cuſtom the Abyſſinians ſtill obſerve.

But this term, which, in its original ſignification, is general, is now reſtrained, by cuſtom, to that impoſition which is practiſed at ordination. Spanheim has written a treatiſe "De Impoſitione Manuum;" and Tribenhorius and Braunius have done the ſame. See ORDINATION.

Imposition *of Tonnage*, &c. See Duty, &c.

IMPOSSIBLE, that which is not poſſible, or which cannot be done or effected. A propoſition is ſaid to be impoſſible when it contains two ideas which mutually deſtroy each other, and which can neither be conceived, nor united together in the mind.

Thus it is impoſſible, that a circle ſhould be a ſquare; becauſe we conceive clearly, that ſquareneſs and roundneſs deſtroy each other by the contrariety of their figure.

There are two kinds of impoſſibilities, *phyſical* and *moral*. Thus,

Phyſical impoſſibility, is that which is contrary to the laws of nature. A thing is *morally* impoſſible, when of its own nature it is poſſible, but yet is attended with ſuch difficulties, as that, all things conſidered, it appears impoſſible.

Thus it is morally impoſſible, that all men ſhould be virtuous; or that a man ſhould throw the ſame number with three dice a hundred times ſucceſſively.

A thing which is impoſſible in law, is the ſame with a thing impoſſible in nature: and if any thing in a bond or deed be impoſſible to be done, ſuch deed, &c. is void. 21 Car. I. B. R.

Impossible *Condition*, in *Law*. See Condition.

Impossible *Forms of Equations*, in the *Indeterminate Analyſis*, are thoſe that will admit of no rational ſolution, ſuch as $2x^2 \pm 3y^2 = z^2$; $3x^3 \pm 7y^3 = z^3$; $3x^4 \pm 7y^4 = z^4$; &c. which are all impoſſible forms of equations; admitting of no ſolution, either in integers or fractions.

The inveſtigation of theſe impoſſible forms does not ſeem to have engaged the attention of Diophantus; but his tranſlators and commentators, as Bachet, Fermat, Father de Billy, &c. have all been led to the conſideration of them, as the means of ſaving much unneceſſary labour, by being able to ſhew in many caſes, before any operation takes place, that the equation under conſideration admits of no ſolution.

The moſt general method of determining impoſſible forms is by means of the linear forms of ſquares, cubes, &c.

Thus all ſquare numbers are of one of the two forms $4n$, or $4n + 1$; *viz.* all ſquare numbers are either exactly diviſible by 4, or when divided by it as far as poſſible, they will leave a remainder 1; and therefore no numbers of the forms $4n + 2$, or $4n + 3$, can be ſquares; or $4n + 2$ and $4n + 3$ are impoſſible forms for ſquare numbers. In the ſame manner, all ſquare numbers are of one of the forms $5n$, or $5n \pm 1$; that is, ſquare numbers, when divided by 5, can only leave the three remainders 0, 1, and -1; or, which is the ſame, 0, 1, and 4; and therefore $5n + 2$, and $5n + 3$, are impoſſible forms for ſquares. Again, all ſquare numbers are of one of the forms $7n$, $7n + 1$, $7n + 4$, or $7n + 2$; and therefore $7n + 3$, $7n + 5$, $7n + 6$, are all impoſſible forms. And thus is conſtructed the following table of the poſſible and impoſſible forms of ſquares to the prime moduli 2, 3, 5, 7, and 11.

Poſſible Forms.	Impoſſible Forms.
$2n,\ 2n + 1$	
$3n,\ 3n + 1$	$3n + 2$
$5n,\ 5n \pm 1$	$5n + 2,\ 5n + 3$
$7n,\ 7n + 1,\ 7n + 2,\ 7n + 4$	$7n + 3,\ 7n + 5,\ 7n + 6$
$11n,\ 11n + 1,\ 11n + 4,\ 11n + 5$ $11n + 9,\ 11n + 3$	$11n + 2,\ 11n + 6,\ 11n + 7$ $11n + 8,\ 11n + 10$

Now by means of theſe linear forms, we readily obtain thoſe of the quadratic forms, ſuch as $2x^2 \pm 3y^2 = z^2$; which is demonſtrated to be impoſſible, as follows.

Firſt, the three indeterminates x, y, and z, may be conſidered as being prime to each other, for if they have any common meaſure, as $x = \phi x'$, $y = \phi y'$, and $z = \phi z'$, the whole equation may be divided by that common meaſure, and thus reduced to another, in which the indeterminates are prime to each other; and therefore if an equation be poſſible, when the terms have a common meaſure, it is alſo poſſible when divided by it, and converſely if an equation be impoſſible when the terms are prime to each other, it is alſo impoſſible in all other caſes. Aſſuming therefore, that in the equation $2x^2 \pm 3y^2 = z^2$, x, y, and z, are prime to each other, we may proceed as follows. Whatever is the form of y^2; $3y^2$ is diviſible by 3, and is therefore of the form $3n$; and x^2 muſt be of one of the forms $3n$, or $3n + 1$; theſe being the only poſſible forms of ſquares numbers to modulus 3. But if x be of the form $3n$, we ſhall have $2(3n) \pm 3n = z^2$, of the form $3n$, that is, z and x are both of the form $3n$, which is contrary to the ſuppoſition, ſince x, y, and z are all three prime to each other; therefore x^2 cannot be of the form $3n$; let it then be of the form $3n + 1$, and the equation becomes $2(3n + 1) \pm 3n = z^2$, of the form $3n + 2$; but $3n + 2$ is an impoſſible form for ſquares, therefore z^2 cannot be of the form $3n + 2$, and conſequently the propoſed equation is impoſſible.

And we ſhould have been led to the ſame reſult, if we had conſidered the equation under the more general form, $(3p + 2)x^2 \pm 3qy^2 = z^2$; that is, all equations falling under this form are impoſſible; hence all the following impoſſible equations are readily obtained.

$$\left.\begin{array}{r}2x^2 \pm 3y^2 = z^2\\ 5x^2 \pm 3y^2 = z^2\\ 8x^2 \pm 3y^2 = z^2\\ 11x^2 \pm 3y^2 = z^2\\ \text{\&c.}\quad \text{\&c.}\end{array}\right\}\ \begin{array}{c}\text{Impoſſible}\\ \text{forms of}\\ \text{equations.}\end{array}\ \left\{\begin{array}{r}2x^2 \pm 6y^2 = z^2\\ 5x^2 \pm 6y^2 = z^2\\ 8x^2 \pm 6y^2 = z^2\\ 11x^2 \pm 6y^2 = z^2\\ \text{\&c.}\quad \text{\&c.}\end{array}\right.$$

In the ſame way it may be demonſtrated that the following equations are all impoſſible.

$$\left\{\begin{array}{l}(5p + 2)\,x^2 \pm 5qy^2 = z^2\\ (5p + 3)\,x^2 \pm 5qy^2 = z^2\\ (7p + 3)\,x^2 \pm 7qy^2 = z^2\\ (7p + 5)\,x^2 \pm 7qy^2 = z^2\\ (7p + 6)\,x^2 \pm 7qy^2 = z^2\end{array}\right. \qquad \left\{\begin{array}{l}(11p + 2)\,x^2 \pm 11qy^2 = z^2\\ (11p + 6)\,x^2 \pm 11qy^2 = z^2\\ (11p + 7)\,x^2 \pm 11qy^2 = z^2\\ (11p + 8)\,x^2 \pm 11qy^2 = x^2\\ (11p + 10)\,x^2 \pm 11qy^2 = x^2\end{array}\right.$$

Theſe formulæ might be carried on indefinitely, each of which will furniſh an infinite number of impoſſible forms of ſquares to each reſpective modulus; only obſerving that the indeterminate q muſt always be prime to the modulus with which it enters.

The impoſſible forms for cubes are aſcertained in a ſimilar manner, by firſt finding the linear forms of them, and then combining them as in the foregoing caſe; thus all cubes are of one of the forms $7n$, $7n + 1$, or $7n + 6$; that is, all cube numbers are either diviſible by 7; or, when divided by it as far as poſſible, the remainder will be either 1 or 6; and hence again it follows, that $7n + 2$, $7n + 3$, $7n + 4$, $7n + 5$, are all impoſſible forms of cube numbers; or if a number, when divided by 7, leaves for a remainder 2, 3, 4, or 5, that number is not a cube. Again, all cube numbers are of one of the forms $9n$, or $9n \pm 1$; and conſequently, no number of the form $9n + 2$, $9n + 3$, $9n + 4$, $9n + 5$, $9n + 6$, $9n + 7$, can be a cube, as theſe are all impoſſible forms.

The equation $2x^3 \pm 7y^3 = z^3$ is impoſſible.

Here, as in the caſe of ſquares, x, y, and z, may be conſidered as prime to each other; and, therefore, for the ſame reaſon as that ſtated in the foregoing demonſtration, x^3 cannot be of the form $7n$, as we ſhould then have z^3 alſo of the ſame form, which is contrary to the hypotheſis, theſe quantities being prime to each other; ſo that if the equation be poſſible, it muſt be when x^3 has one of the forms $7n \pm 1$, and this ſuppoſition gives $2(7n \pm 1) \pm 7n = z^3$; of the form $7n \pm 2$, which is an impoſſible form for cubes; and therefore the equation $2x^3 \pm 7y^3 = z^3$ is impoſſible.

In the ſame way it may be ſhewn, that each of the following equations is impoſſible.

$$\left.\begin{array}{r} 2x^3 \pm 7y^3 = z^3 \\ 3x^3 \pm 7y^3 = z^3 \\ 4x^3 \pm 7y^3 = x^3 \\ 5x^3 \pm 7y^3 = z^3 \\ 9x^3 \pm 7y^3 = z^3 \\ 10x^3 \pm 7y^3 = z^3 \end{array}\right\} \qquad \left\{\begin{array}{l} 2x^3 \pm 9y^3 = z^3 \\ 3x^3 \pm 9y^3 = z^3 \\ 4x^3 \pm 9y^3 = z^3 \\ 5x^3 \pm 9y^3 = z^3 \\ 6x^3 \pm 9y^3 = z^3 \\ 7x^3 \pm 9y^3 = z^3 \end{array}\right.$$

And theſe, again, may be farther generalized, by writing them

$$\begin{array}{ll} (7p + 2)\,x^3 \pm 7qy^3 & (9p + 2)\,x^3 \pm 9qy^3 \\ (7p + 3)\,z^3 \pm 7qy^3 & (9p + 3)\,x^3 \pm 9qy^3 \\ (7p + 4)\,x^3 \pm 7qy^3 & (9p + 4)\,x^3 \pm 9qy^3 \\ (7p + 5)\,x^3 \pm 7qy^3 & (9p + 5)\,x^3 \pm 9qy^3 \\ (7p + 9)\,x^3 \pm 7qy^3 & (9p + 6)\,x^3 \pm 9qy^3 \\ (7p + 10)\,x^3 \pm 7qy^3 & (9p + 7)\,x^3 \pm 9qy^3 \end{array}$$

No one of which equations can ever become equal to a cube, either in integers or fractions; provided that q be taken prime to the modulus with which it enters.

A ſimilar mode of inveſtigation may be purſued with all the higher powers, the only difficulty being in fixing upon a proper modulus; that is, ſuch a number as hath the moſt impoſſible forms belonging to it, which requires a ſeparate inveſtigation. (See Power.) But almoſt every power has ſome modulus that renders it expreſſible in three forms; thus,

All 3d powers are of one of the forms	$7n$, or $7n \pm 1$
4th powers - - -	$5n$, or $5n + 1$
5th powers - - -	$11n$, or $11n \pm 1$
6th powers - - -	$7n$, or $7n + 1$
8th powers - - -	$17n$, or $17n \pm 1$
9th powers - - -	$19n$, or $19n \pm 1$
10th powers - - -	$11n$, or $11n + 1$
&c. &c.	&c. &c.

Here the 7th power is now omitted, not being reducible to a ſimilar form; by means of theſe linear forms various others, as $ax^m \pm by^m = cz^m$, may be demonſtrated to be impoſſible.

Beſide theſe equations, which are demonſtrable to be impoſſible, from the linear forms of the reſpective powers, there are others that have been noticed by Bachet, Fermat, Lagrange, Euler, &c.; but theſe generally require very laborious demonſtrations, of which Euler has given ſeveral deſcriptions in the Peterſburgh Acts. The Memoirs of Berlin alſo contain many papers on this ſubject by Lagrange; thus, $x^3 \pm y^3 = z^3$ is impoſſible, as is alſo $x^4 \pm y^4 = z^4$, and various others; and generally, the equation $x^n \pm y^n = z^n$ is impoſſible, if n be greater than 2. This propoſition was firſt propoſed by Fermat as a challenge to all the Engliſh mathematicians of his time, but the general demonſtration of it was not publiſhed till very lately, *viz.* for November 1810, in Nicholſon's Philoſophical Journal, by Mr. P. Barlow, and to which the reader is referred for a complete inveſtigation of this intereſting numeral propoſition. See alſo Barlow's "Elementary Inveſtigations, &c."

Impossible *Roots of Equations.* See Imaginary *Roots.*

Impossible *Quantity*, in *Algebra.* See Root.

IMPOST, from *impono*; *I impoſe*, in *Law*, properly denotes the tribute or tax appointed by a ſovereign to be paid for ſuch merchandize as is brought into any haven in his dominions from foreign nations. See Duty.

Impoſt is diſtinguiſhed from *cuſtom*, in that cuſtom more properly ſignifies the duties paid to the king for goods ſhipped off or exported. But the two are frequently confounded together.

IMPOSTHUME, by corruption from *impoſtem* and *apoſtem*, *abſceſs*, a collection of matter, or pus, in any part of the body, either owing to an obſtruction of the fluids in that part, which makes them change into ſuch a matter; or to a tranſlation of it from ſome other part where it was generated. See Abscess.

IMPOSTORS, Religious, are ſuch as falſely pretend to an extraordinary commiſſion from heaven; and who terrify and abuſe the people with falſe denunciations of judgments. Theſe are puniſhable in the temporal courts with fine, impriſonment, and infamous corporal puniſhment. 1. Hawk. P. C. 7.

IMPOSTS, in *Architecture*, the capitals of pillars, or pilaſters, which ſupport arches. See *Baſilic* in *Plate Architecture.*

An impoſt, ſometimes alſo called *chaptrel*, is a ſort of little cornice, which crowns a pier, and ſupports the firſt ſtone, whence an arch or vault commences.

Impoſts conform to their proper orders. The Tuſcan is a plinth only; the Doric has two faces crowned; the Ionic has a larmier over the two faces, and its mouldings may be carved; the Corinthian and Compoſite have a larmier, frieze, and other mouldings.

The projecture of the impoſt muſt not exceed the naked of the pilaſter. Sometimes the entablature of the order ſerves for the impoſt of the arch; and this looks very grand and ſtately.

The impoſt is a thing eſſential to an ordonnance; inaſmuch as without it, in the place where the curve line of the arch meets with the perpendicular line of the pillar, there always ſeems a kind of elbow.

P, in *fig. Baſilic*, repreſents an impoſt made open or flat in the middle, and bounded by fillets or ogee. This kind of impoſt is ſaid to be the invention of lord Burlington, and it may be called a Burlington impoſt. It is enriched with a *guloic*, or bands forming circles and interſecting each other: when there are two rows it is called a *double* guloic.

The following rules are given by ſome modern authors for dividing the impoſts of arches: in the Tuſcan impoſts the facia hath 3 parts, the ogee 1, the fillet $\frac{1}{2}$, the corona 3, and the band $1\frac{1}{2}$. For the projections, the facia $\frac{1}{2}$, the ogee two parts, corona 3, and the whole $3\frac{1}{2}$. In the Doric, the frieze 2, fillet $\frac{1}{4}$, aſtragal $\frac{3}{4}$, cyma recta $2\frac{1}{4}$, fillet $\frac{1}{4}$, corona 2, ogee 1. For the projections, fillet $\frac{1}{2}$, aſtragal 1, corona $2\frac{1}{2}$, and the whole $3\frac{1}{2}$.

In the Ionic, fillet $\frac{1}{2}$, cyma 4, ovolo $1\frac{1}{4}$, corona $1\frac{1}{2}$, ogee 1. For the projections, cyma $1\frac{3}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

In the Corinthian, the frieze $1\frac{3}{4}$, fillet $\frac{1}{4}$, aſtragal $\frac{1}{2}$, cyma $2\frac{1}{4}$, ovolo 1, corona $1\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{4}$, aſtragal $\frac{3}{4}$, cyma $1\frac{3}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

In the Compoſite, frieze 2, fillet $\frac{1}{4}$, aſtragal $\frac{3}{4}$, the cyma $1\frac{1}{2}$, corona $1\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{4}$, aſtragal $\frac{3}{4}$, ovolo $1\frac{1}{2}$, cyma $2\frac{1}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

IMPOTENCE is more particularly uſed to denote an inability in the male to impregnate the female. This inability, however, ariſes from two very different conditions of the body; in one of which the venereal congreſs cannot be accompliſhed; but, in the other, although coition be effected, the ſemen is not tranſmitted into the uterus. Whence the noſologiſts have properly diſtributed the varieties of this inability under two heads, or diſtinct diſeaſes, *viz.* *Anaphrodiſia*, or a defect of the venereal appetite and power, which is *impotency* ſtrictly ſo called; and *Dyſpermatiſmus*, or an impeded and interrupted emiſſion of the ſemen in the generative act. The various mechanical impediments which conſtitute the latter ſpecies of the diſeaſe, have been enumerated under the proper head; and conſiſt principally in diſorders of the canal of the urethra, by which the paſſage is obſtructed, or of the adjoining parts by which it is compreſſed; in either caſe, the exit of the ſeminal fluid is impeded, or altogether prevented.

The *anaphrodiſia*, or incapability of coition, may originate from three cauſes; to wit, from a connate or original imperfection in the conformation of the organs ſubſervient to generation, a circumſtance of very unuſual occurrence; from a paralyſis affecting the muſculi erectores of the penis (Anaphrodyſia *à paralyſi*, Sauvages, claſs vi. genus xiii. ſpec. 1.); or from a too ready efflux of the ſemen, *e. g.* during the evacuation of the bowels, or at the commencement of the diſtention of the virile organ (A. *gonorrhoica*, Sauv. ſpec. 2.) Where the diſeaſe conſiſts in a malconformation of the organs, or of any of their appendages, it muſt be of courſe beyond the reach of medical relief. When it originates from palſy, affecting the erector muſcles, it is ſcarcely more favourable; ſince it is then only a part of a more general palſy affecting one ſide of the body (hemiplegia), or the lower extremities (paraplegia), or originating from injury to the ſpinal nerve, occaſioned by falls or other external violence. When the complaint is occaſioned by an extreme relaxation, as it were, of the ſecretory veſſels, inſomuch that the ſemen is poured out from the ſlighteſt irritation in their vicinity (ſuch as the paſſage of the ſtools, or the friction of the dreſs), or from the ſmalleſt determination of blood to the parts before the diſtention of the member is produced, medical treatment, with proper regimen, may be reſorted to with ſucceſs. This ſpecies of *anaphrodiſia* has been aſcribed to early maſturbation, to exceſs in venereal pleaſures, and to the occurrence of frequent gonorrhæas; but it cannot be doubted, that deſigning quacks have multiplied and exaggerated the repreſentations of this kind beyond the truth, and that their books have done more harm than good, by the imaginary diſorders with which they have afflicted weak and hypochondriacal men. In ſuch caſes, the ordinary means of ſtrengthening the body by light and nouriſhing diet, and by the uſe of the bark and ſteel, or other vegetable and mineral tonics, together with the uſe of the cold bath, muſt be reſorted to. In many of thoſe caſes, Mr. Hunter obſerves, waſhing the penis, ſcrotum, and perinæum with cold water, is often of ſervice; and to render it colder than we find it at ſome ſeaſons of the year, common ſalt may be added to it, and the parts waſhed when the ſalt is almoſt diſſolved. Hunter on the Ven. Diſeaſe, pt. iii. chap. xii.

The able and diſtinguiſhed phyſiologiſt juſt alluded to, remarked that the influence of the mind upon the operations of the body was moſt conſpicuous in reſpect to this function, and that various ſtates of apprehenſion, conſciouſneſs of impropriety, &c. ſometimes altogether prevented the performance of it: the neceſſity, therefore, of inveſtigating into the ſtate of the mind, when impotency is complained of, was ſtrongly pointed out by him from long obſervation, and illuſtrated by the following caſe: A gentleman conſulted him reſpecting the loſs of virility; but after ſome inquiry, Mr. Hunter found that the phyſical powers were not defective, and that it could only ariſe from a particular ſtate of mind: whence the mind was to be applied to for the cure; and Mr. Hunter aſſured him that he might be cured, if he could only rely on his own power of ſelf-denial. The patient was requeſted, therefore, to ſleep with the individual with whom his inability had manifeſted itſelf, having firſt promiſed himſelf to abſtain from any connection for ſix nights, let his inclinations and powers be what they might. This plan produced a complete alteration in the ſtate of his mind, and was followed by a perfect and permanent cure. (Loc. cit.) See Dyspermatismus.

Impotency is a canonical diſability to avoid marriage in the ſpiritual court. The marriage is not void *ab initio*, but voidable only by ſentence of ſeparation during the life of the parties.

IMPRACTICABLE Case, in *Algebra*. See Irreducible.

IMPRECATION, derived from *in*, and *precor*, *I pray*; a curſe, or wiſh that ſome evil may befal any one.

The ancients had their goddeſſes called *Imprecations*, in Latin *Diræ*, *i. e.* *Deorum iræ*, who were ſuppoſed to be the executioners of evil conſciences. They were called *Diræ* in heaven, *Furies* on earth, and *Eumenides* in hell. The Romans owned but three of theſe Imprecations, and the Greeks only two. They invoked them with prayers and pieces of verſes to deſtroy their enemies.

IMPREGNATION, derived from *impregnare*, of *pregnans*, a *woman with child*; the emiſſion of the ſeed of the male in coition, by which the female conceives, or becomes with young. See Generation.

Impregnation is alſo figuratively uſed in pharmacy, when a liquor imbibes the particles of ſome other body.

Thus a menſtruum is ſaid to be impregnated with a body diſſolved in it, as much as its pores are able to receive.

Impregnation, in *Natural Hiſtory*, is one of the modes in which organized ſubſtances have become mineraliſed and preſerved in the ſtrata of the earth; Mr. William Martin, in his "Outlines," p. 50, defines this term, as applying to the mechanical impregnation of organic ſubſtances with mineral matters, and he ſhews the diſtinctions between this and a chemical union of mineral ſubſtances with the organic matter, called converſion.

IMPRESSED Species. See Species.

IMPRESSING, in the *Sea Language*. See Manning *the Fleet*.

IMPRESSION, in *Natural Hiſtory*, is a term implying the interior of the matrix or mould in which an extraneous foſſil has been incloſed and its form impreſſed. The matrix is ſaid to be filled when the reliquium remains in the impreſſion, empty when the reliquium has been renewed from the impreſſion. Sometimes, after the organic body has been removed, mineral or inorganic matter takes its place, and aſſumes the external form of the reliquia, and ſuch are often called *caſts*, which is the ſtate in which the foſſil ſhells of a great number of ſtrata are found. Mr. James Parkinſon, at the commencement of his "Organic Remains," was inclined, vol. i. p. 37, to exclude impreſſions and caſts from the rank of ſecondary foſſils or organic remains, but the further reſearches of this able writer ſeem to have conſiderably modified his ideas on this ſubject.

Impression, in *School Philoſophy*, is applied to the ſpecies of objects which are ſuppoſed to make ſome mark or impreſſion on the ſenſes, the mind, and the memory.

The Peripatetics tell us, that bodies emit ſpecies reſembling them, which ſpecies are conveyed by the exterior ſenſes to the common ſenſory: theſe impreſſed ſpecies, being material and ſenſible, they ſay, are rendered intelligible by the active intellect; and when thus ſpiritualized, are called *expreſſions*, or *expreſs ſpecies*, as being expreſſed from the others.

Impression is alſo frequently uſed in ſpeaking of the editions of a book, or of the number of times it has been printed.

Impreſſion, however, differs from *edition*: the former, properly ſpeaking, takes in no more than what belongs to the printing, the letter, paper, margin, page, diſtances of words and lines, and the diſpoſition of every thing that may have a good or bad effect upon the eye; the latter, beſides all this, takes in the care of the editor, who has reviſed the copy, corrected or augmented it, adding notes, tables, and other like things, which he judged might contribute towards making the book more uſeful and correct.

Indeed, very frequently the word edition only refers to this latter part; as when, in ſpeaking of the works of St. Auguſtine, we quote the edition of Eraſmus, the Lovaniſts, Benedictines, &c. where we have no regard to the printing part, but only to the care and pains of the editors.

Impression, *Privilege for*. See Privilege.

Impressions on *gems* and *medals*. See Gems and Medals.

IMPREST, *Auditors of*. See Auditors.

IMPRISONMENT, the ſtate of a perſon reſtrained of his liberty, and detained under the cuſtody of another; and extends not only to a gaol, but to a houſe, ſtocks, or a man's being held in the ſtreet, &c. (2 Inſt. 589.) None ſhall be impriſoned but by the lawful judgment of his peers, or by the law of the land. Mag. Ch. 9 Hen. III. c. 2. 25 Edw. III. ſtat. 5. c. 4.

No perſon is to be impriſoned, but as the law directs, either by the command or order of a court of record, or by lawful warrant, which warrant muſt be in writing, under the hand and ſeal of the magiſtrate, and expreſſing the cauſe of the commitment, in order to be examined (if neceſſary) upon a "habeas corpus;" or the king's proceſs, on which one may be lawfully detained; and at common law a perſon could not be impriſoned unleſs he were guilty of ſome force or violence, for which his body was ſubject to impriſonment, as one of the higheſt executions. Where the law gives power to impriſon, in ſuch caſe it is juſtifiable, provided he that does it in purſuance of a ſtatute, exactly purſues the ſtatute in the manner of doing it, for otherwiſe it will be deemed falſe impriſonment, and in conſequence it is unjuſtifiable. Every warrant of commitment for impriſoning a perſon, ought to run, "Till delivered by due courſe of law," and not "Until farther order;" which has been held ill, and thus it alſo is, where one is impriſoned on a warrant, not mentioning any cauſe for which he is committed. If there be no cauſe expreſſed, the gaoler is not bound to detain the priſoner. For the law judges in this reſpect, ſaith ſir Edward Coke, like Feſtus the Roman governor; that it is unreaſonable to ſend a priſoner, and not to ſignify withal the crimes alleged againſt him.

A perſon being ſent to priſon by a warrant from a ſecretary of ſtate, without aſſigning any cauſe, &c. it was adjudged, that he ought to be diſcharged for that reaſon. Perſons may alſo, by bail or habeas corpus, be diſcharged from their impriſonment in any caſe bailable. See the articles Habeas Corpus, Bail, Prison, Prisoner, and Gaol.

Imprisonment, *Falſe*. See False and Appeal.

IMPROMTU. See Inpromtu.

IMPROPER Feuds, in *Law*. See Feud.

Improper *Fractions*, in *Arithmetic*. See Fractions.

IMPROPRIATION is a term uſed where the profits of an eccleſiaſtical benefice are in the hands of a layman.

In which ſenſe it ſtands diſtinguiſhed from appropriation; which is where the profits of a benefice are in the hands of a biſhop, college, &c. though the two are now often uſed promiſcuouſly. There are ſaid to be 3845 impropriations in England.

IMPROPRIETY, the quality of ſomething that is not fit, or proper. See Proper, and Propriety.

Grammarians obſerve three kinds of faults againſt purity in language; a ſoleciſm, barbariſm, and impropriety: an impropriety is committed when a word is uſed that has not a *proper* ſignification.

This is an offence againſt lexicography, as barbariſm reſpects etymology and the ſoleciſm ſyntax. It is the buſineſs of the lexicographer to aſſign to every word of the language the preciſe meaning or meanings which uſe hath aſſigned to it. This fault may be committed either in ſingle words or in phraſes. Improprieties as to ſingle words are ſuch as a writer is apt unwarily to be ſeduced into by ſome reſemblance or proximity in ſound or ſenſe, or both. It is by proximity in ſound that ſeveral are miſled to uſe the word "obſervation" for "obſervance," as when they ſpeak of the religious obſervation of a feſtival for the religious obſervance of it. By a ſimilar miſtake "endurance" hath been uſed for "duration," and confounded with it; whereas its proper ſenſe is patience. This was the caſe in the days of queen Elizabeth, when endurance was ſynonymous with duration, though in this acceptation it is now obſolete. Thus alſo "human" and "humane" are ſometimes confounded; the adjectives "ceremonious" and "ceremonial" are ſometimes uſed promiſcuouſly; and the word "conſtruction" is variouſly applied, &c. &c. With regard to improprieties ariſing from a ſimilitude in ſenſe, we may mention "veracity" ſtrictly applicable to perſons, uſed for "reality," which pertains to things; "verdict" uſed for "teſtimony;" "riſible" for "ridiculous," &c. &c. To this claſs we may refer the "idiotiſm," or the employing of an Engliſh word in a ſenſe which it bears in ſome provincial dialect, in low and partial uſe, and which perhaps the correſponding word bears in ſome foreign tongue, unſupported by general uſe in our own language: ſuch are "impracticable" when it is uſed for "impaſſable," and applied to roads; "intend" when uſed for "mean," "decompound" for "analyſe," &c. &c. Another error of the ſame kind is the "latiniſm;" ſuch as the uſe of the word "affection," when applied to things inanimate, and ſignifying the ſtate of being affected by any cauſe; and "integrity" when uſed for "entireneſs." To theſe properly ſucceeds that ſort of the "vulgariſm" in which only a low and partial uſe can be pleaded in ſupport of the application that is made of a particular word. Of this an example occurs in the following paſſage cited from the "Guardian" (N° 57) "'Tis my humble requeſt you will be particular in ſpeaking *to* (for *on*) the following points." Of the ſame ſtamp is "on't" for "of it." The derivatives, "falſeneſs," "falſity," "falſehood," from the root "falſe," are often erroneouſly applied for one another, though they ought to be diſtinguiſhed. "Falſeneſs" is properly uſed in a moral ſenſe for want of veracity, and applied only to perſons; the other two are applied only to things. "Falſity" denotes that quality in the abſtract, which may be defined contrariety to truth. "Falſehood" is an untrue aſſertion. The ſame miſapplication occurs in the uſe of the word "conſcience" for "conſciouſneſs."

Of improprieties that occur in phraſes the firſt we ſhall mention is, when the expreſſion, on being grammatically analyſed, is diſcovered to contain ſome inconſiſtency, ſuch is the phraſe "of all others" after the ſuperlative; *e. g.* "the moſt perfect of all others" ſhould have been "more perfect than any other," or "the moſt perfect of all" the things to which it refers. To this claſs belong thoſe improprieties which involve in them ſome abſurdity. Others are thoſe by which an author is made to ſay one thing when he means another. Another ſpecies of impropriety is that in which there appears ſome ſlight incongruity in the combination of the words; *e. g.* "when you fall *into a man's converſation*, &c." for "fall *into converſation with a man*:"—"the falſe taſte *the town is in*, &c." for the "falſe taſte of the town." Campbell's Philoſophy of Rhetoric, vol. i. p. 456, &c.

IMPROVEMENT, in *Agriculture*, a term applied to any ſort of amelioration which is produced on lands either by the ſeveral different operations and proceſſes which they are capable of admitting, or by the general practices of cultivation. See DRAINING and WATERING, &c.

IMPROVEMENT *of Landed Property*, the art of rendering it more valuable to the proprietors, and at the ſame time more beneficial to the public. It has been well remarked that the poſſeſſors of this ſort of property "have a double intereſt, a two-fold motive to incline them toward the improvement of their eſtates; namely, to augment their perſonal incomes, and to increaſe the proſperity of the land they live in."

The ſpecies of improvements that landed property is capable of admitting, are conſidered as very numerous; but they may probably be arranged under the following heads.

1. Reclaiming watery lands.
2. Appropriating commonable lands.
3. Conſolidating appropriated lands.
4. Laying out eſtates.
5. Laying out farm-lands.
6. Laying out farms.
7. Improving farm-lands.
8. Improving wood-lands.
9. Improving waters.
10. Improving mines, quarries, &c.

The firſt of theſe objects may in moſt caſes be effected by proper draining and embanking, the ſecond by incloſure, the third by means of exchange, purchaſe, or ſale; and the whole of the reſt by the ſeveral methods that are deſcribed under the particular heads to which they immediately belong. See DRAINING, EMBANKING, COMMONABLE *Lands*, &c. &c.

It is ſuggeſted, that by the political conſtitution of this country the government has no power or legal means of advancing its proſperity by the improvement of *appropriated territory*; unleſs by ſpecial acts of the legiſlature. And that even theſe are confined to a few particular objects; as drainage, incloſure, and the conſolidation of intermixed lands; and theſe only, where a plurality of intereſts are concerned. In the maſs of improvements which are here to be brought forward, and in all caſes of private property, it is out of the power of the public to interfere. A proprietor may ſuffer his eſtate to lie waſte with impunity, provided he thereby injures no other man's private property. And if an eſtate be permitted to lie partially waſte, or under-productive, for the want of due improvement, the loſs to the public, though not ſo large, is of the ſelf-ſame nature. In the appropriation of a wild uncultivated country, it is hinted, that it might be wiſe in a government to reſerve a power of rendering its lands productive, as a wiſe poſſeſſor of an eſtate reſerves the right of keeping his farms in tenantable repair and huſband-like cultivation at the expence of the tenant who refuſes or neglects to perform his duty. But as no ſuch reſervation has been made, nor in any way claimed in this country, the proprietors of its lands are, it is ſuppoſed, bound not only by the ties of intereſt, but by thoſe of honour, to promote their improvement.

It is conſidered that the baſis or ground-work of improvement on which a practical man may tread with ſafety and full effect, is an accurate delineation of the *exiſting ſtate*, together with a faithful eſtimate of the *preſent* value of the lands and other valuable particulars of an eſtate to be improved. A general map of the appropriated lands, promptly exhibiting the ſeveral farms and fields as they lie, and ſhewing the exiſting watercourſes, embankments, fences, and buildings, the woodlands, ſtanding waters, moraſſes, and moory grounds; the known mines and quarries, together with the commonable lands, if any, belonging to the eſtate, forms a comprehenſive and uſeful ſubject of ſtudy to the practical improver. It is to him, what the map of a country is to a traveller, or a ſea-chart to a navigator. If an eſtate is large, a faithful delineation of it will enable him in a few hours to ſet out with advantages reſpecting the connections and dependencies of the whole and its ſeveral parts, with which as many days, weeks, or months could not furniſh him, without ſuch ſcientific aſſiſtance. If, on the ſame plan, the rental value of each mine, quarry, woodland, and productive water in its preſent ſtate be ſtated, the preparatory information which ſcience is capable of furniſhing may be conſidered as complete. And it remains with the artiſt to ſtudy, with perſevering attention, the ſubject himſelf, in order to diſcover the ſpecies of *improvements* of which it is ſuſceptible, and the ſuitable means of carrying them into execution. See *Landed* PROPERTY.

IMPROVIDE', in *Law*. See QUI *Improvidé*.

IMPROVISARE, *Ital.* to ſing or play extempore.

IMPROVISATORE, *Ital.* an extemporaneous ſinger of verſes upon a given ſubject. A voluntary player, an organiſt who is able to treat in a maſterly manner a given ſubject of fugue, extempore, is juſtly allowed to be a man of conſiderable abilities.

The improviſatori, in poetry, ſeem confined to the ſouthern provinces of Europe. Italy, Spain, and Portugal, appear excluſively to enjoy the gift. It is indeed unwillingly credited elſewhere. And yet there is nothing more common in Italy, than to ſee, during the carnival, two maſks meet, defy, challenge, and attack each other in verſe, and anſwer, ſtanza for ſtanza, to the ſame air, with a vivacity, dialogue, melody, and accompaniment, which, without the having been preſent, it is difficult to comprehend. But Dionyſius Halicarnaſſeus informs us, that in the firſt Roman triumph of Romulus over the Cænienſes, the army followed in three ſeveral diviſions, hymning their gods in ſongs of their country, and celebrating their general with *extemporary verſes:* this account affords a very venerable origin to the improviſatori of Italy; as the event happened in the fourth year of Rome, ſeven hundred and forty-nine years before Chriſt, and the fourth year of the ſeventh Olympiad.

This ſurpriſing faculty, in modern times, extends to females. Such was the admirable improviſatrice, Madalena Morelli, commonly called the Corilla, whom we ſaw and heard at Florence in 1770; and who, beſides her poetical inſpirations, played well on the violin, reſting it on her lap, not her ſhoulder, like Madame Sirman. It was at the houſe of Nardini, of whom ſhe had learned the violin, that we heard her perform. She had likewiſe a pleaſing voice, and ſung with taſte, expreſſion, and no inconſiderable degree of execution. This accompliſhed female having been long celebrated all over Europe for the marvellous fertility and readineſs with which ſhe inſtantly produced the moſt elegant verſes on whatever ſubject, and in whatever meaſure, ſhe was requeſted to give ſpecimens of her talents; after having been received with acclamation into the celebrated academy of the Arcadi at Rome in 1775, in the preſence of the firſt nobility and men of letters and ſcience, in July 1776 ſhe was ſolemnly crowned in the Campidoglio, as Petrarch had been in the fourteenth century. See Corilla.

IMPULSIVE, a term in philoſophy, applied to the action of the body which impels or puſhes another.

Thus the arm is ſaid to give an impulſive motion to the ſtone that it throws. See Projectile.

In this ſenſe, impulſive ſtands contradiſtinguiſhed from *attractive* and *repulſive.*

Sir Iſaac Newton ſuggeſts, that attraction itſelf may poſſibly be effected by an impulſive power.

IMPURITY, in the *Moſaic* law. There were ſeveral ſorts of impurity contracted under the law of Moſes. Some were voluntary, as the touching of a dead body, or of any animal that died of itſelf, or of any creeping thing, or unclean creature; or the touching things holy by one who was not clean, or was not a prieſt; or touching perſons under impure circumſtances. Other kinds of impurity there were of an involuntary nature; for which we muſt refer the reader to Calmet, who ſhews what kind of purification was preſcribed for each ſpecies of pollution. See Numb. xix. 11—14. Levit. xi. 24—43. Levit. xii. 23—45. Id. xv. 25. Calm. Dict. Bibl. in voc.

IMPUTATION, a term much uſed among divines, ſometimes in a good, and ſometimes in an ill ſenſe: in the latter it is uſed to ſignify the charging the ſin to the account of one, which was committed by another. The word, however, is generally uſed in an ill ſenſe; for when we place any good to the account of another, we uſe the word attribute.

Thus Adam's ſin is ſaid by ſome divines to be imputed to all his poſterity; all his deſcendants by his fall becoming as criminal in the ſight of God, as if they had fallen themſelves; and bearing the juſt puniſhment of his firſt crime. See *Original* Sin.

Imputation, uſed in a good ſenſe, ſignifies the charging of another's juſtice or merit.

Thus the juſtice of Jeſus Chriſt is ſaid to be imputed to us; his merits, and the price of his ſufferings, being applied to us.

IN, in the *Manege.—To put a horſe* in, is an expreſſion that ſignifies to breed and dreſs him, by putting him right upon the hand and the heels.

In, in the *Sea Language*, denotes the ſtate of any of a ſhip's ſails, when they are furled or ſtowed: it is uſed in oppoſition to *out*, which implies that they are ſet, or extended to aſſiſt the ſhip's courſe.

In-*penny and out-penny*, in our *Old Writers*, money paid by the cuſtom of ſome manors on the alienation of tenants, &c.—In-penny and out-penny "conſuetudo talis eſt in villa de Eaſt Radham, de omnibus terris quæ infra Burgagium tenentur, viz. quod ipſe, qui vendiderit vel dederit dictam tenuram alicui, dabit pro exitu ſuo de eadem tenura unum denarium, & ſimile de ingreſſu alterius; et ſi prædicti denarii a retro fuerint, ballivus domini diſtringet pro eiſdem denariis in eadem tenura." Regiſt. Prior. de Cokesford, p. 25.

In *and Out*, in *Ship Building*, is a term often uſed to ſignify the ſcantling of the timbers the moulding way, but more generally applied to the bolts which connect the ſides of the ſhip together by being driven the thwartſhip way through the knees, riders, &c.

INA, in *Biography*, king of Weſſex, one of the moſt illuſtrious princes in the Saxon heptarchy, ſucceeded to the crown in 689, and began his courſe by attempts at extending his dominions by force of arms. He invaded Kent, but was induced by a large ſum of money to deſiſt from his enterpriſe. He then obtained poſſeſſion of Cornwall and Somerſetſhire, which he annexed to his kingdom, treating the vanquiſhed with a degree of humanity hitherto but little practiſed by the Saxon conquerors. By his code of laws he is placed as a legiſlator at the head of the Saxon kings previouſly to Alfred. Though he was diſturbed by ſome inſurrections at home, his long reign of thirty-ſeven years may be regarded as one of the moſt glorious and moſt proſperous of the heptarchy. In the decline of life he made a pilgrimage to Rome, and after his return ſhut himſelf up in a cloiſter, where he died. Hume.

Ina, in *Geography*, a town of Japan, in the iſland of Niphon; 22 miles N.W. of Faniſſima.

INACCESSIBLE *Height* or *Diſtance*. See Altitude, Distance, &c.

Inaccessible *Iſland*, in *Geography*, a ſmall iſland in the South Atlantic ocean, and one of thoſe called the iſlands of Triſtan de Cunha. It has obtained the name from its being a high, bluff, apparently barren plain, viſible at the diſtance of 14 or 15 leagues, about nine miles in circumference, and having on the whole a very forbidding appearance; with a high rock detached from it at the ſouth end. S. lat. 37° 19′. W. long. 11° 50′.

INACHIA, Ιναχια, in *Autiquity*, a feſtival in Crete, celebrated in honour of Leucothea, or Ino.

The word is compounded of Ino, and ἄχος, *i. e.* grief; being, perhaps, a commemoration of Ino's misfortunes.

INACORI, in *Geography*, a town of Hindooſtan, in Marawar; 20 miles N.N.W. of Ramanadporum.

INACTION, *ceſſation of action*, a term much uſed in the myſtical divinity; by which is underſtood a privation, or annihilation of all the faculties; whereby the door is, as it were, ſhut to all external objects, and a kind of ecſtacy is procured, during which God ſpeaks immediately to the heart. It is the ſtate of inaction that is held the moſt proper for receiving the Holy Spirit; and in this fit of dozing, they ſay, it is that God communicates ſublime and ineffable ſentiments and graces to the ſoul.

Some do not make it conſiſt in this ſtupid kind of indolence, or general ſuſpenſion of all ſenſation : but by inaction only mean a ceſſation of deſires, in which, as the ſoul does not determine itſelf to any poſitive acts, neither does it abandon itſelf to uſeleſs meditations, or the vain ſpeculations of reaſon ; but demands in general every thing that may be agreeable to God, without preſcribing any thing to him.

This latter is the doctrine of the ancient myſtics, and the former that of the modern ones, or the quietiſts.

In general, however, it may be ſaid, that inaction is not the moſt likely way of pleaſing God ; by our actions chiefly we are to gain his favour : he will have us to act ; ſo that inaction cannot be agreeable to him.

INACTIVITY *of Matter.* See Vis *inertiæ.*

INADEQUATE Idea, or *notion*, is a partial or incomplete repreſentation to the mind. See Idea.

INAGUA, or Yanagua, in *Geography*, two iſlands of the Weſt Indies, near the N. W. coaſt of St. Domingo. N. lat. 21° 2′ to 20° 26′. W. long. 72° 50′ to 71° 30′.

INAJA Guacuiba, in *Botany*, a name by which ſome authors have called the cocoa-nut tree, or *palma Indica nucifera* of other writers.

INAKA, in *Geography*, a town of Japan, in the iſland of Niphon ; 130 miles W. of Meaco.

INALIENABLE, that which cannot be validly alienated, or made over to another. See Alienation.

Thus the dominions of the king, the church, minors, &c. are inalienable, otherwiſe than with a reſerve of the right of redemption for ever.

INAMBLUCIA, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the ſelenitæ ; but of the number of the columnar, not the rhomboidal kinds, and compoſed merely of parallel fibres. See Selenites.

INAMELLING, or Enamelling. See Enamelling.

INANIMATE, derived from *in*, taken privatively, and *anima, ſoul*, denotes a body that has either loſt its ſoul, or that is not of a nature capable of having any.

Thus a dead man is an inanimate lump, and metals are inanimate bodies.

INANITION, in *Medicine*, emptineſs, or that ſtate of the ſtomach when it has been too long deprived of food.

Man, as well as many other animals, is capable of ſubſiſting for a conſiderable length of time without food. But, in this caſe, among other effects of inanition, ſuch as languor, debility, &c., the moſt remarkable conſequence which enſues, is the extreme irritability of the ſtomach itſelf, which is now eaſily excited to extraordinary vaſcular action, by the ſmalleſt quantity of food or drink, ſo that it is difficult to avoid occaſioning inflammation of that organ, in attempting to reſtore the health and ſtrength of the ſufferer. This law of the vital power, (excitability, or ſenſorial power, in the language of Brown and Darwin,) is the ground-work of the ſyſtems of medicine promulgated by theſe two phyſicians ; namely, that whenever the accuſtomed ſtimulus of any organ, or of the body at large, has been long withdrawn, ſuch an accumulation of that power takes place, that a much ſmaller ſtimulus than ordinary is capable of producing extraordinary excitement. (See Excitability.) In ſuch caſes, therefore, the utmoſt caution is required to reſtore the natural ſtimulus by ſlow degrees ; uſing firſt ſubſtances of the leaſt ſtimulating power, and in very ſmall quantity. Thus in a froſt-bitten limb, which is produced by the too great abſtraction of the ſtimulus of heat, the attempt to reſtore its vitality by warm applications is invariably productive of inflammation and gangrene, and the limb will drop off, if the life of the patient be not alſo deſtroyed. The only ſucceſsful mode of reſtoration is to rub the part with ſnow, or with cold water, which are of a temperature ſomething above the cold of the limb. (See Cold.) In like manner, in the attempt to reſtore a perſon to ſtrength, who has ſuffered from *inanition*, the firſt nutriment given muſt be fluid, that it may not irritate by its hardneſs and weight, in ſmall quantity, for a ſimilar reaſon, deſtitute of every heating and ſtimulating quality, from vinous, ſpirituous, or aromatic ſubſtances, and very eaſy of digeſtion, or containing little nutriment, ſo that the action of the ſtomach may not be too much excited for accompliſhing the digeſtive proceſs. Hence in extreme caſes, a ſpoonful of milk and water, or milk alone, to be repeated every hour, would be one of the ſafeſt and moſt effectual remedies : and by ſlow and cautious ſteps, nutriment of a more ſubſtantial kind, and more copious in quantity, might be afterwards reſorted to, attending rather to the wants of the ſtomach, than to the ſtated hours of meals.

INANITY, the ſchool term for emptineſs, or abſolute vacuity, and implies the abſence of all body and matter whatſoever, ſo that nothing remains but mere ſpace.

INARCHING, in *Gardening*, a particular ſort of grafting, called alſo by ſome grafting by approach. It is uſed when the ſtock intended to be grafted on, and the tree from which the graft is to be taken, ſtand ſo near one another, that they may be brought to touch. The branch to be inarched is to be fitted to that part of the ſtock where it is to be joined, the rind and wood are to be pared away on one ſide for the length of three inches, and the ſtock or branch where the graft is to be united is to be ſerved in the ſame manner, ſo that the two may join equally together, and the ſap meet ; a little tongue is then to be cut upwards in the graft, and a notch made in the ſtock to admit it, ſo that when they are joined, the tongue will prevent their ſlipping, and the graft will more cloſely unite to the ſtock. Having thus brought them exactly together, they may be tied with ſome baſs or worſted, or other ſoft tying, and then the place muſt be covered with ſome grafting clay, to prevent the air from drying the wound, and the wet from rotting the ſtock : a ſtake muſt be fixed in the ground, to which both the ſtock and the graft muſt be tied, to prevent the wind's diſplacing them. When they have remained in this ſtate four months, they will be ſufficiently united, and the graft may then be cut off from the mother-tree, obſerving to ſlope it cloſe to the ſtock, and at this time there ſhould be freſh clay laid all round the part. This operation ſhould be performed in April or May, that the graft may be perfectly united to the ſtock, before the enſuing winter. It is principally practiſed upon oranges, myrtles, jeſſamines, walnuts, and firs, and ſome other trees, which do not ſucceed well in the common way of grafting. But it is a wrong practice when orange trees are deſigned to grow large, for theſe are ſeldom long-lived after the operation. See Ablactation and Grafting.

INARTICULATE, an epithet applied to ſuch ſounds, ſyllables, or words, as are not pronounced diſtinctly. See Articulation.

INAUGURATION, the coronation of an emperor, or king ; or the conſecration of a prelate, ſo called in imitation of the ceremonies uſed by the Romans, when they were received into the college of augurs. See Crown, King, and Bishop.

The word comes from the Latin *inaugurare*, which ſignifies to dedicate a temple, or to raiſe any one to the prieſthood, having, in order to that, firſt taken auguries. See AUGUR, and AUGURY.

IMBATZKOI NOVIMSKOI, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Eniſei; 124 miles S. of Turuchanſk. N. lat. 63° 40′. E. long. 89° 14′.

IMBATZKOI *Verchnei*, a town of Ruſſia, in the government of Tobolſk; 168 miles S. of Turuchanſk.

IN-BOARD, a term uſed to ſignify any thing that is withinſide the ſhip; as the in-board works are all deſigned on a drawing ſo called, &c.

INCA, or YNCA, an appellation which the natives of Peru give to their kings and princes of the blood.

The chronicle of Peru relates the origin of the incas: this country had been a long time the theatre of all ſorts of wars, horrible crimes, and diſſentions, till at length there appeared two brothers, the one of whom was called Mancocapac: of this perſon the Indians uſe to tell wonders; they ſay he built the city of Cuſco, ſettled laws and policy, and taught them to adore the ſun: and he and his deſcendants took the name of inca, which, in the language of Peru, ſignifies *king*, or *great lord*. Theſe incas grew ſo powerful, that they made themſelves maſters of the whole country, from Chili to Quito, eſtabliſhing in every province their peculiar policy and religious inſtitutions, and held it till the diviſions between the brothers Huaſcar and Atahualpa; which the Spaniards under Pizarro laying hold of, made themſelves maſters of Peru, and put an end to the empire of the incas, in 1533. They number only twelve of theſe incas. It is ſaid, the moſt conſiderable among the nobles in the country ſtill bear the name of inca.

INCALESCENCE, compounded of *in*, and *caleo*, or *caleſco, I grow warm*, the growing hot of any thing, either by motion and friction, or as quick-lime does by pouring water on it.

INCALESCENT MERCURY, a name given by Mr. Boyle to ſome mercuries of an uncommon preparation; which, by being mingled with a due proportion of gold-leaves, or ſmall filings, would amalgamate and grow hot with the gold.

INCAMERATION, derived from *in*, and *camera*, *chamber*, in the *apoſtolic chancery*, the union of ſome land, right or revenue, to the domains of the pope. See CHAMBER.

INCANTATION, derived from the Latin *in*, and *canto*, *I ſing*, (ſee CHARM, and CARMEN,) *inchantment*; words and ceremonies uſed by magicians to raiſe devils; or rather to impoſe on the credulity of the people. See CONJURATION, FASCINATION, MAGIC, WITCHCRAFT, &c.

INCAPACITY, in matters of benefices, among the canoniſts, is of two kinds; the one renders the proviſion of a benefice null in its original; the other is acceſſary, and annuls the proviſions which at firſt were valid.

Incapacities of the firſt kind, are the want of a diſpenſation for age in a minor, for legitimation in a baſtard, for naturalization in a foreigner, &c.

Of the latter kind, are grievous offences and crimes: as being concerned in ſeeing a ſentence of death executed, &c. which, they decree, vacate the benefice to all intents, or render the holding it irregular.

INCARNACION, in *Geography*, a town of Paraguay; 360 miles S. of Aſſumption.—Alſo, a town of New Navarre; 18 miles W. of Caſa Grande.

INCARNATION, in *Theology*, ſignifies the act whereby the Son of God aſſumed the human nature; or the myſtery by which Jeſus Chriſt was made man, in order to accompliſh the work of our ſalvation. The era uſed among Chriſtians, whence they number their years, is the time of the incarnation, that is, of Chriſt's conception in the virgin's womb.

This era was firſt eſtabliſhed by Dionyſius Exiguus, about the beginning of the ſixth century, till which time the era of Diocleſian had been in uſe.

Some time after this, it was conſidered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occaſioned them to poſtpone the beginning of this era for the ſpace of one year, retaining the cycle of Dionyſius entire in every thing elſe.

At Rome they reckon the years from the incarnation, or birth of Chriſt, that is, from the 25th of December, which cuſtom has obtained from the year 1431. In France, and ſeveral other countries, they alſo reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Florentines retain the day of the birth, and begin their year from Chriſtmas. See Petav. de Doct. Temp. Grandamicus de Dei Nat. See ÆRA and EPOCHA.

INCARNATIVE, an epithet in *Surgery*, applied to ſuch medicines as tend to promote the proceſs, by which wounds and ulcers become filled up with granulations.

INCARNATIVE *Bandage*. See BANDAGE.

INCARNATIVE *Suture*. See SUTURE.

INCENADA DE BARRAGAN, in *Geography*, a town of South America, ſituated on the W. bank of the Barragan, at its union with the Plata. The houſes are irregularly built, and the inhabitants are generally indolent and poor; 21 miles W. of Buenos Ayres.

INCENDIARY, INCENDIARIUS, in *Law*, is applied to one who is guilty of maliciouſly ſetting fire to another's dwelling-houſe, and all out-houſes that are parcel thereof, though not contiguous to it, nor under the ſame roof, as barns and ſtables. A bare intent, or attempt to do this by actually ſetting fire to a houſe, unleſs it abſolutely burns, does not fall within the deſcription of *incendit et combuſſit*. But the burning and conſuming of any part is ſufficient, though the fire be afterwards extinguiſhed. It muſt alſo be a malicious burning; otherwiſe it is only a treſpaſs. This offence is called arſon in our law.

Among the ancients, criminals of this kind were to be burnt. "Qui ædes, acervumque frumenti juxta domum poſitum ſciens, prudenſque dolo malo combuſſerit, vinctus igni necatur." See ARSON. See alſo BLACK-*act* and FIRE-*cocks*.

INCENSE, from *incenſum*, q. d. *burnt*; as taking the effect for the thing itſelf; an aromatic, odoriferous reſin, otherwiſe called *frankincenſe*.

INCEPTIVE, a word uſed by Dr. Wallis, to expreſs ſuch moments, or firſt principles, which, though of no magnitude themſelves, are yet capable of producing ſuch as are. See INFINITE, and INDIVISIBLE.

Thus a point has no magnitude itſelf, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a ſurface which has breadth, &c.

INCERATION, in the *Materia Medica*, the mixing of liquids with ſomething that is dry, by a gentle ſoaking, till the compoſition be brought to a ſubſtance of the conſiſtence of ſoft wax.

INCERTAINTY, in *Law*, is where a thing is ſo ambiguouſly ſet down, that the plain meaning cannot be underſtood: and this is ſaid to be the mother of contention. The queſtions of incertainty ariſe ſometimes on matter of record, as writs, counts, pleas, verdicts, &c. and ſometimes on deeds or writings, or upon contracts, &c. (5 Rep. 121. Plowd. 25.) In law proceedings, incertainty will make them void; for all proceedings in law are to be certain and affirmative; but the defendant may be at a certainty as to what he ſhould anſwer, &c. (Plowd. 84.) If the court and verdict in an appeal be uncertain, there can be no judgment given thereon; and it is the ſame on an indictment. (3 Mod. 121.) Incertainty in deeds renders them void; but ſometimes a term for years granted by leaſe, may be made certain by reference to certainty; and incertainty may be reduced to certainty by matter, *ex poſt facto*, implication, &c. (Plowd. 6. 273. 6 Rep. 20.) If there are two men of one name, and a deviſe of lands, &c. is to one of that name, without any diſtinction, it will be void for incertainty; though perhaps an averment may make it good. (2 Bulſtrode, 180.) Incertainty in declarations of uſes, of fines, of lands, &c. is rejected in law; for otherwiſe there would be no certain inheritances. 9 Rep.

INCEST, the crime of venereal commerce between perſons who are related in a degree prohibited marriage by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection, ſo neceſſary in marriage, might be heightened by this double tie; and yet the rules of the church have formerly extended this prohibition even to the ſeventh degree, but time has now brought it down to the third or fourth degree. See Marriage.

Moſt nations look on inceſt with horror, Perſia and Egypt alone excepted. In the hiſtory of the ancient kings of thoſe countries we meet with inſtances of the brother's marrying the ſiſter: the reaſon was, becauſe they thought it too mean to join in alliance with their own ſubjects: and ſtill more ſo to have married into the families of any foreign princes.

As to the Perſians, there was a ſtill more abominable ſort of inceſt practiſed by their magi: if we may truſt Catullus, carm. 91.

> "Nam magus ex matre & gnato gignatur oportet,
> Si vera eſt Perſarum impia religio."

In 1650, inceſt and wilful adultery were made capital crimes; but at the Reſtoration it was not thought proper to renew a law of ſuch unfaſhionable rigour: and theſe offences have been ever ſince left to the feeble coercion of the ſpiritual court, according to the rules of the canon law.

Incest, *Spiritual*, is the like crime committed between two perſons who have a ſpiritual alliance, by means of baptiſm or confirmation.

Incest, *Spiritual*, is alſo underſtood of a vicar, or other beneficiary, who enjoys both the mother and the daughter; that is, holds two benefices, the one whereof depends on the collation of the other.

Such a ſpiritual inceſt renders both the one and the other of thoſe benefices void.

INCESTUOUS, the name of a ſect or hereſy, which aroſe in Italy about the year 1065.

The hereſy of the Inceſtuous had its beginning at Ravenna; the learned of which place, being conſulted by the Florentines about the degrees of affinity which prohibit marriage, made anſwer, that the ſeventh generation, mentioned in the canons, was to be taken on both ſides together; ſo that four generations were to be reckoned on one ſide, and three on the other.

They proved this their opinion by a paſſage in Juſtinian's Inſtitutes, where it is ſaid, that a man may marry his brother's or ſiſter's grand-daughter, though ſhe be but in the fourth degree: whence they concluded, that if my brother's grand-child be in the fourth degree with reſpect to me, ſhe is in the fifth with reſpect to my ſon, in the ſixth with reſpect to my grandſon, and in the ſeventh with reſpect to my great grandſon.

Peter Damian wrote againſt this opinion, and pope Alexander II. condemned it in a council held at Rome.

INCH, a meaſure of length, in China, is $\frac{1}{10}$th of the Chineſe foot = 10 fen = 100 li = 100 hao.

Inch, *Engliſh lineal*, $\frac{1}{12}$th of an Engliſh foot = $1\frac{1}{3}$ digits or finger's breadth = 3 barley-corns = 48 hair's breadths = $\frac{1}{36}$th Engliſh yard = .938306 pouces of France = .02539185 metres of the new meaſures = .1262626 links.

Inch, *Engliſh ſquare or ſuperficial*, is $\frac{1}{144}$th, or .00694444 ſquare feet = .000644746 ſquare metres of the new meaſures of France = .01594225 ſquare links.

Inch, *Engliſh cubic or ſolid*, is $\frac{1}{1728}$th, or .000578704 cubic feet = .0000163713 cubic metres of the new meaſures of France = .00201291 cubic links.

Inch, *French*, *of length*, or pouce of the old meaſures of France, was $\frac{1}{12}$th of the Paris foot = 12 lines = 1.0657 Engliſh inches = .02706137 metres of the new meaſures = .1345644 links.

Inch, *Scotch*, *of length*, is $1\frac{1}{185}$th Engliſh inches = 1.0054054 = $\frac{1}{12}$th Scotch foot.

Inch, in *Geography*, an iſland in the bay called Lough Swilly, in the county of Donegal, Ireland. It is very fertile, and contains about 2000 acres. Its land and the adjoining ſhores are high, with cultivation ſpreading over them, and little cluſters of cabins with groups of wood. The water is of great depth, and a ſafe harbour for any number of ſhips. Inch was the great reſort of the Lough Swilly herring fiſhery, which at one time employed 500 boats, and afforded ſubſiſtence to a great number of people. A large ſalting houſe with neceſſary ſtore rooms was built in the iſland, but the profits of the fiſhery have declined.

Inch, a town of Scotland, in the county of Aberdeen; 10 miles N. W. of Inverary.

Inch-*Callech*, an iſland of Scotland, in Loch-Lomond, on which are the remains of a conventual church.

Inch-*Colm*, a ſmall iſland of Scotland, on the northern ſide of the Frith, anciently called Amonia; on which are the ruins of a celebrated abbey of Auguſtine monks, founded about the year 1123, by Alexander I. king of Scotland, who was thrown upon it by a tempeſt, in gratitude for his eſcape, and dedicated to St. Columba. It was pillaged by the fleet of Edward III. of England, when he invaded Scotland. Some ruins ſtill remain. N. lat. 56° 3′. W. long. 3° 18′.

Inch-*Garvie*, a ſmall iſland in the Forth, oppoſite to Queensferry, fortified with cannon to defend the river.

Inch-*Keith*, a ſmall iſland of Scotland, in the Frith of Forth; ſo called from the name of a brave hero who fought valiantly againſt the Danes in 1010, to whom it was granted; 12 miles E.S.E. of Dumfermline. N. lat. 56° 3′. W. long. 3° 9′.

Inch-*Kenneth*, a ſmall iſland near the W. coaſt of Mull. N. lat. 56° 29′. W. long. 6° 10′.

Inch-*Marnoch*, a ſmall iſland, about a mile in extent, near the W. coaſt of the iſle of Bute; it has 120 acres of arable land, 40 of bruſhwood, nearly 300 of moor, together with ſtrata of coral and ſhells on the W. ſide.

Inch-*Murrin*, an iſland in Loch-Lomond, two miles long, which is converted into a deer-park. On it are the remains of a manſion, belonging to the family of Lenox.

Inch-*Point*, a cape of Ireland, between Dingle bay and Caſtlemain harbour, in the county of Kerry; 13 miles E. from Dingle.

Inch *of Candle*, a manner of ſelling goods among merchants. The method of it is thus: Notice is uſually given upon the Exchange in writing and elſewhere, when the ſale is to begin: againſt which time the goods are divided into ſeveral parcels, called *lots*, and papers printed of the quantity of each, and of the conditions of ſale; as, that none ſhould bid leſs than a certain ſum more than another had bid before. During the time of the bidding a ſmall piece, of about an inch, of wax-candle, is burning; and the laſt bidder, when the candle goes out, has the lot or parcel expoſed to ſale.

INCHASING, in *Sculpture*. See Enchasing.

INCHIGEELA, in *Geography*, a ſmall town of the county of Cork, province of Munſter, Ireland, near the ſource of the river Lee, over which it has a bridge. It is ſituated in a wild mountainous country, and is a very poor place. It is eight miles W.S.W. from Macromp, and 24 W. from Cork.

INCHIN, a ſmall iſland in the Pacific ocean, near the coaſt of Chili. S. lat. 45° 40′.

INCHOATIVE, a term ſignifying the beginning of a thing, or action; the ſame with what is otherwiſe called *inceptive*.

Inchoative *verbs* denote, according to Priſcian and other grammarians, verbs that are characteriſed by the termination *ſco* or *ſcor*, added to their primitives: as *augeſco*, from *augeo*, *caleſco*, from *caleo*, *dulceſco*, from *dulcis*, *iraſcor*, from *ira*, &c.

INCHOFFER, Melchior, in *Biography*, a learned German, was born at Vienna in 1584. Having laid the foundation of a learned education, he applied himſelf to the ſtudy of the law, and became a diſtinguiſhed proficient in it at the age of 23. He then quitted it, and entered himſelf among the Jeſuits, went to Rome and employed his time in the ſtudy of philoſophy, theology, and the mathematics. Shortly after this he was called to fill the chair of profeſſor in thoſe faculties, during ſeveral years at Meſſina, in Sicily. In 1630 he publiſhed a book entitled "The Virgin Mary's Letter to the People of Meſſina proved to be genuine." Complaints were preferred againſt him before the congregation of the "Index" at Rome, on account of this publication. He immediately repaired to the city, vindicated himſelf, and was allowed to reprint his work, with a ſmall alteration in the title. He died at Milan in 1648, when he was about 64 years of age. Having received ſome injuries from his brethren, he wrote a ſatire againſt them, which was printed after his death under the title of "Monarchia Solipſorum." Inchoffer was author alſo of "Tractatus Syllepticus, in quo quid de Terræ Soliſque motu, vel ſtatione ſecundum Sacram Scripturam et S.S. Patrum ſentiendum, &c. Oſtenditur, 1633;" "De ſacra Latinitate, de variis Linguæ Latinæ myſteriis, ex Origine, Progreſſu, Fine," &c.; "Hiſtoriæ trium Magorum;" likewiſe the firſt volume of a work entitled "Annalium Eccleſiaſticorum Regni Hungariæ," which is ſaid to have exhibited ſuch proofs of critical ſkill and deep reſearch, as occaſioned regret that the author did not live to complete his plan.

INCHTURE, in *Geography*, a town of Scotland, in the county of Perth, on the road between Perth and Dundee; 9 miles E. of Perth.

INCIDE, in *Medicine*, to *cut*, whence alſo the adjective *inciſive*, obſolete terms, applied to certain articles of the materia medica, to denote the action and quality by which certain fluids are detached from the parts to which they adhere, by an operation which has been conceived analogous to *cutting* with a ſharp inſtrument, probably from the peculiar ſenſation which they excite. Theſe *inciſives* are principally *acids*, *alkalis*, or neutral ſalts, the action of which upon the palate, and other ſenſible parts, is, from the ſame analogy, called *ſharp*. Hence alſo, in popular language, we ſpeak of *cutting the phlegm*, &c. But this action is principally a chemical *coagulation of the mucus* (as in the caſe of ſore throat), which then loſes its adheſive qualities, and is eaſily rejected; and not a mechanical diviſion of the particles, by means of the pointed and ſharp atoms of thoſe acid and ſaline matters, as the original employers of the term imagined.

INCIDENCE, in *Mechanics*, expreſſes the direction in which one body ſtrikes on another; otherwiſe called *inclination*.

In the incurſions of two moving bodies, their incidence is ſaid to be *perpendicular* or *oblique*, as their directions or lines of motion make a ſtraight line, or an oblique angle at the point of contact.

Incidence, *Angle of*, commonly denotes the angle comprehended between an incident ray, or other body, and a perpendicular to the plane in the point of incidence.

Thus, ſuppoſing A B (*Plate* I. *Optics*, *fig.* 3.) an incident ray proceeding from the radiant point A, to B the point of incidence, and H B a perpendicular to D E in the point of incidence: the angle A B H, comprehended between A B and H B, is the angle of incidence, by others called the angle of inclination.

Incidence, *Angle of*, is alſo uſed by Dr. Barrow, and ſome others, for the complement of the above angle, or of the angle of inclination.

Thus, ſuppoſing A B an incident ray, and H B a perpendicular, as before; the angle A B D comprehended between it and the reflecting or refracting plane D E, is the angle of incidence; and the angle A B H the angle of inclination.

Others, with Wolfius, make another diſtinction; which ſee under the articles Angle, Reflection, and Refraction.

It is demonſtrated by optical writers, 1°. That the angle of incidence A B H is always equal to the angle of reflection H B C, or the angle A B D to the angle C B E, and they lie in the ſame plane. See Reflection.

2°. That the ſines of the angles of incidence and refraction are to each other accurately, or very nearly in a given ratio. See Refraction.

3°. That from air to glaſs the ſine of the angle of incidence is to the ſine of the refracted angle as 300 to 193, or nearly as 14 to 9: on the contrary, that from glaſs to air, the ſine of the angle of incidence, is to the ſine of the refracted angle as 193 to 300, or as 9 to 14. See Refraction.

It is true, ſir Iſaac Newton having ſhewn, that the rays of light are not all equally refrangible, there can be no preciſe ratio fixed between the ſines of the angles of refraction and incidence: but the proportion which comes neareſt is that above ſpecified. See Light, Colour, Refrangibility, &c.

Incidence *of Eclipſe*. See Eclipse and Immersion.

Incidence, *Axis of*. See Axis *of incidence*. Such is the line B H, *fig.* 3.

Incidence, *Cathetus of.* See CATHETUS *of incidence*; ſee alſo Reflection.

Incidence, *Line of,* in *Catoptrics,* denotes a right line, as A B (*fig.* 3), whereby light is propagated from a radiant point A, to a point B, in the ſurface of a ſpeculum. This is alſo called an *incident ray.*

Incidence, *Line of,* in *Dioptrics,* is a right line, as A B, *Plate* VI. *fig.* 4. whereby light is propagated unrefracted, in the ſame medium, from the radiant point to the ſurface of the refracting body H K L I.

Incidence, *Point of,* is the point B on the ſurface of the reflecting or refracting medium, in *Plate* I. *fig.* 3. and *Plate* VI. *fig.* 4. on which the incident ray falls.

Incidence, *Scruples of.* See Scruples.

INCIDENT, in a general ſenſe, denotes an event, or a particular circumſtance of ſome event.

Incident, in *Law,* is a thing appertaining to, or following another, that is more worthy or principal. A court-baron is inſeparably incident to a manor; and a court of pie-powders to a fair.

Incident, in a *Poem,* is an epiſode, or particular action, joined to the principal action, or depending on it.

A good comedy is to be full of agreeable incidents, which divert the ſpectators, and form the intrigue. The poet ought always to make choice of ſuch incidents as are ſuſceptible of ornament ſuitable to the nature of his poem. The variety of incidents well conducted makes the beauty of an heroic poem, which ought always to take in a certain number of incidents to ſuſpend the cataſtrophe, that would otherwiſe break out too ſoon.

Incident *Ray.* See Ray, Incidence, and Inclination.

Incidents, in the *Materia Medica.* See Attenuants.

INCINERATED Salts, the ſame with lixivial ſalts. See the following article, and Lixivial.

INCINERATION, derived from *in,* and *cinis, aſhes,* in *Chemiſtry,* the reduction of vegetables into aſhes, by burning them gently.

Thus fern is incinerated for the making of glaſs.

INCISED Wounds, wounds made with ſharp-edged, cutting inſtruments. See Wounds.

INCISION, the ſame as inciſed wound.

Incision, *Crucial.* See Crucial.

Incision, *grafting by double.* See Grafting.

INCISIVUM Foramen, in *Anatomy,* a hole in the bony palate, juſt behind the inciſor teeth, forming a communication between the palate and the naſal cavities. See Cranium.

INCISIVUS, or Incisorius, an epithet applied by Winſlow to ſome muſcles about the lips. The inciſivus medius is the depreſſor alæ naſi. (See Depressor.) The inciſivus lateralis is the levator labii ſuperioris. (See Deglutiton.) The inciſivus inferior is the levator menti. See Deglutition.

The openings leading from the noſe to the palate have been called ductus inciſivi.

INCISORES, the four front teeth of each jaw; ſo named becauſe they poſſeſs ſharp cutting edges. By Linnæus they are called dentes primores. See the deſcription of the teeth in the article Cranium.

INCISORIUM, from *incido,* to cut, the table for operations and diſſections, uſed by ſurgeons and anatomiſts.

INCISORIUS, in *Anatomy.* See Incisivus.

INCLAVE, in *Heraldry,* a term uſed by Morgan to expreſs an irregular line in heraldry, differing from the indented, invected, and all the others. It is called by ſome patee, and by others the dove-tail line, from its reſemblance to that joint, known among our joiners by this name. It is alſo called by ſome the labelled line. It has theſe names from the figure of the points, as they proceed from the ordinary, ſuch as a chef or ſeſs reſembling the ends of labels.

INCLINATION, in *Medicine* and *Chemiſtry,* the operation of pouring off a clear liquor from ſome fæces, or ſediment, by only gently ſtooping the veſſel.

This amounts to the ſame with what is otherwiſe called *decantation.*

Inclination, in *Phyſics,* expreſſes the mutual approach or tendency of two bodies, lines, or planes, towards one another; ſo that their directions make at the point of contact an angle of a greater or leſſer magnitude.

Inclination *of a right line to a plane,* is the acute angle which ſuch a right line makes with another right line drawn in the plane through the point where the inclined line interſects it, and through the point where it is alſo cut by a perpendicular drawn from any point of the inclined lines.

Inclination *of Meridians,* in *Dialling,* the angle that the hour-line, on the globe, which is perpendicular to the dial plane, makes with the meridian.

Inclination *of an incident ray,* otherwiſe called the *angle of inclination.* See *Angle of* Incidence.

Inclination *of a reflected ray,* is the angle which a ray after refraction makes with the axis of inclination.

Thus, if A B, (*Plate* I. *Opt. fig.* 3.) be the incident ray, H B a perpendicular to D E in the point R, and B C the reflected ray, C B H will be the inclination of the reflected ray, and A B H the inclination of the incident ray.

Inclination *of the axis of the earth,* is the angle which it makes with the plane of the ecliptic: or the angle between the planes of the equator and ecliptic.

Inclination *of the magnetic needle.* See Dipping-*needle.*

Inclination *of a planet,* is an arc or angle comprehended between the ecliptic, and the plane of a planet in his orbit. See each planet.

Inclination *of a plane,* in *Dialling,* is the arc of a vertical circle, perpendicular both to the plane and the horizon, and intercepted between them.

To find this, take a quadrant, and apply its ſide to the ſide of a ſquare, and apply the other ſide of your ſquare to your plane: if the plumbet fall parallel to the ſide of the ſquare, then the lower ſide of the ſquare ſtands level; by which draw an horizontal line, whereon erect a perpendicular, and apply your ſquare to that perpendicular; and if the plumbet falls parallel to the ſide of the ſquare, then that is alſo a level line, and your plane ſtands horizontally: if the plumbet fall not parallel to the ſide of the ſquare, then turn your ſquare, until it does; and draw an horizontal line, on which erect a perpendicular, to which apply your ſquare, and obſerve what angle your plumbet makes on the quadrant, with the ſide of the ſquare: that is the angle of the inclination of the plane. See Declination.

Inclination *of two planes,* is the acute angle made by two lines drawn one in each plane, through a common point of ſection, and perpendicular to the ſame common ſection.

Thus, in *Plate* VIII. *Geometry, fig.* 101. the inclination of the plane K E G L to the plane A C D B, is the angle H F I, made by the right lines H F and F I in the point F, perpendicular to the line of ſection E G.

Inclination, *Angle of,* in *Optics,* is the ſame with what is otherwiſe called the *angle of incidence.*

Inclination, *Argument of.* See Argument.

Inclination, in a moral ſenſe. See Appetite.

Inclination, in *Mining,* is uſed ſometimes to expreſs the fall or declivity of a ſtratum which deviates from the horizontal, or a mineral vein, windike, or fault, which deviate from the vertical, and ſuch ſtrata or fiſſures are ſaid to dip, deep, pick, decline, tilt, have a declivity, or to hade, want, batter-off, underbeat, &c. in different diſtricts or ſituations. See Dip and Hade.

INCLINED Plane, in *Mechanics*. See *Inclined* Plane. See alſo Mechanics, and Mechanical *powers*.

Inclined *Planes*, in *Engineery*, are ſtrong frames of wood or maſſes of earth and maſonry, formed into an inclined plane at top, on which a ſingle or double rail or tram-way is laid for drawing up and letting down boats or waggons from one water level of a canal to another, or from one part of a rail-way to another, where a deficiency of water prevents the uſe of locks, or the deſcent is too rapid for a rail-way to deſcend: formerly, inclined planes for boats were called rolling bridges. In our article Canal we have given the principles of ſetting out and conſtructing inclined planes, and inſtanced all the moſt conſiderable works of this kind in Great Britain.

Inclined *Plane*, in *Rural Economy*, a term applied to that ſort of plane which forms an oblique angle with the horizon. In the conſtruction of carriage-ways for the conveyance of different kinds of heavy loads up ſteep elevations and other riſing grounds, this mode has lately been had recourſe to with much advantage, in enabling great weights to be drawn on them with much leſs power of draught. In collieries, and other ſimilar extenſive works, roads formed on this principle are frequently found highly beneficial. It has been lately obſerved, that though this ſort of convenience may have hitherto been principally confined to coal works, mines, and other undertakings of the ſame nature, the period is now at hand " when carriages, moving on level ſurfaces, or on gently inclining planes, with little friction, and without obſtruction, are faſt ſpreading over the face of the country." Beſides thoſe which have been noticed, there are many other uſes and ſituations in which they may be employed with the utmoſt utility and advantage. See Railways.

Inclined *Towers*. See Towers.

INCLINERS, in *Dialling*. See Dial, and Decliners.

INCLOSING *of* Land, in *Agriculture*, the act, operation, or proceſs of taking in and dividing grounds by means of fences. The advantages that neceſſarily reſult from the incloſure of land, whether in a ſtate of waſte, common, or otherwiſe, are extremely numerous, and of the moſt material conſequence to the community. It has been obſerved, that " in addition to thoſe of aſcertaining and ſecuring the property, it holds out not only the moſt ready and certain means of improvement in the cultivation of the former, but in ſuch as have been long under the plough, or any other ſyſtem of management; being equally uſeful in its tendency to bring them into the moſt perfect and advantageous ſtates of culture. Without incloſing, it is conceived, however, much attention may have been paid, or expence incurred, in carrying on the various proceſſes that are requiſite in preparing land for the reception and growth of good crops; whether of the grain, root, or graſs kinds, it is obvious that they can neither be conducted under the moſt beneficial management, nor yield the full advantage they are capable of, while they continue in a free and open ſtate. Where the land is in a ſtate of arable cultivation without incloſure, the crops, of whatever ſort they may be, muſt conſtantly be expoſed to depredations of various kinds; and if in the ſtate of graſs or paſture, injuries of the moſt prejudicial nature muſt frequently be unavoidably ſuſtained. And the great advantage and importance of incloſing land are ſtill more fully demonſtrated in the differences which may be obſerved in reſpect to the quantity and value of the produce, in ſuch as have been thus divided, over that which is cultivated in the ſtate of open or common field." It has been ſtated by Mr. Donaldſon, that " in proportion as a field or a country is bleak, naked, and expoſed to chilling blaſts and winter ſtorms, in the ſame proportion will it be unproductive, compared with lands more favourably ſituated. Incloſing is a mean of obtaining, by art, a certain degree of that genial warmth ſo eſſential to the production of valuable crops, but which nature is not always pleaſed to beſtow. Every day's experience proves that where grounds are ſheltered from the violence of ſtorms, as by garden walls, or by plantations of foreſt trees, they are more productive, and vegetation is earlier than in others ſimilar in every reſpect, unleſs in regard to expoſure. How many inſtances occur to eſtabliſh this fact in reſpect to large fields, as well as to gardens, orchards, &c. Let the obſervant farmer, who poſſeſſes an incloſed farm, examine that part of a field where, owing to the decay of fence, the wind enjoys a free paſſage, and he will be ſatisfied of the benefit of incloſing, from the ſuperiority of the crop in the other part of the field over that which is within the influence of this additional expoſure. While, on the other hand, the poſſeſſor of an open field farm, by examining the ſuperior verdure that takes place in any part of an open field, that is, by ſome accidental circumſtances ſheltered in a remarkable degree, may ſatisfy himſelf, that were the whole equally ſheltered, the produce would be more abundant." In the Mid-Lothian Report it is likewiſe ſtated, that " as the warmeſt air lies neareſt the ſurface of the earth, being that portion of the atmoſphere, which, like a blanket, nature ſpreads over the ſoil and its productions, fences of all kinds tend more or leſs to prevent ſuch a valuable covering from being blown off by the winds." Indeed, by judicious fencing in, or incloſing of land, there can be no doubt but that warmth and ſhelter is afforded to cattle of various kinds. Under theſe circumſtances, animals are invariably found not only to advance in fleſh much more rapidly, but to be freer from diſorders, than when kept in ſituations or expoſures that are bleak, and which cannot afford warmth or ſhelter to them. " If any perſon entertain doubts reſpecting the incloſed paſtures being better adapted for rearing and fattening live ſtock than open fields, he may eaſily ſatisfy himſelf by comparing the live ſtock in an incloſed pariſh with that of one in the open field ſtate." It is ſuppoſed there muſt be much miſtake " if he will not find them in the latter, not only fewer in number, but each animal, on an average, thirty or forty per cent. inferior in value." In fact, incloſing, it is conceived, " may be denominated the firſt ſtep towards effecting improvements in the breeds of the different ſpecies of live ſtock. And on the whole, this " is reaſoning on plain eſtabliſhed facts, and on ſuch as afford the moſt indubitable evidence of the ſuperiority of incloſed fields, whether for tillage or paſturage. Were farther proof neceſſary, the additional rent that is every where paid for incloſed land, beyond that paid for land of an equal quality in the open field ſtate, is ſufficient to place the matter beyond all poſſibility of doubt."

Beſides, the value of the land in moſt ſituations is conſiderably improved by the practice of incloſing. The proportion of increaſe that may be produced in this way, whether the lands incloſed be in a ſtate of leaſe, or in the occupation of the proprietor, muſt, however, neceſſarily depend greatly on the nature of the ſoil, and the ſyſtem of management that is afterwards purſued.

In a work on modern agriculture it is remarked, that " lands of a middling quality, good turnip ſoil for inſtance, are probably benefited to a greater degree by incloſing, than thoſe of ſuperior or inferior quality. Lands of this deſcription, in the open field ſtate, may, it is contended, be conſidered as rented to the full at fifteen ſhillings per acre; whereas there are few inſtances where ſuch lands, when incloſed, are rented under twenty ſhillings; an advance ſo great as to afford the proprietor a handſome profit after paying the intereſt of the money expended. Thus does incloſing not only increaſe the quantity and quality of the produce, ſo as to enable the farmer to pay his landlord a higher rent, and to contribute a larger ſhare to the revenues of the ſtate, but from ſo many people being conſtantly employed in making and repairing the fences, incloſing, in this view, muſt alſo be conſidered as beneficial."

It muſt, however, be allowed, that there are in many diſtricts of this kingdom extenſive, barren, and mountainous tracts of ground that are not capable of ever being incloſed with the leaſt chance of advantage; or which, if they could be incloſed, could never derive any amelioration or improvement from it: the only methods in which they can be bettered, is by being rendered in ſome ſituations more free from injurious ſurface moiſture, by judicious drainage, or the introduction of better breeds of the ſeveral kinds of domeſtic animals which may be turned upon them. Some of the large ſheep farms in different parts of Scotland, as in the ſhire of Peebles and the Highlands, are much in this ſtate, no other ſort of incloſing being neceſſary than merely a *ring fence*, or boundary round the different farms. And where any kind of incloſures become requiſite within ſuch fences, they are ſimply ſuch as permit of the culture of a ſmall number of acres for the uſe of the farmeries, or in the view of forming plantations for protection and ſhade, &c.

In other ſituations where the lands are capable of being cultivated almoſt conſtantly under the grain ſyſtem, incloſing, at leaſt with any kind of high fences, may, in a great meaſure, if not wholly, be unneceſſary. But, in common, where lands are proper for being cultivated under a ſyſtem of huſbandry, ſuch as that of alternating graſs or other kinds of green crops with thoſe of grain or root crops, and in that way having the means of combining improvement in the breed of live ſtock with that of the cultivation of grain, the practice of incloſing muſt always be neceſſary and advantageous in a high degree.

Yet, however advantageous in theſe different points of view the benefits reſulting from the incloſing of lands may be, the practice is far from being ſo much promoted and attended to as its importance ſeems to deſerve. And it is probable that this may in ſome meaſure have proceeded from the great difficulty that neceſſarily attends the buſineſs in almoſt every inſtance, and particularly where waſte or common field lands are to be incloſed, on account of the great diverſity of claims upon them, as well as ſometimes from the improper management of the perſons who have the direction of the buſineſs. Where incloſures of this ſort are to be made, the circumſtances that are chiefly to be regarded are thoſe of the rights of the different claſſes of claimants, without any diſtinctions, the aſcertaining fully the nature and extent of the land to be incloſed, the proviſion of proper cottages for the poor in the acts of incloſure, and the appointment of commiſſioners duly qualified for the execution of the buſineſs.

It has been remarked by Mr. Somerville, in a paper on the different modes of forming incloſures, in the ſecond volume of "Communications to the Board of Agriculture," that incloſing has long been conſidered, and very juſtly, not only as a certain means of improving waſte and uncultivated lands, but alſo as an eſſential requiſite to the completion of improvements upon the beſt ſoils, and ſuch as have been long under tillage. For whatever care or expence may have been employed in clearing, draining, tilling, manuring, weeding, &c. the whole of the benefits reſulting from theſe can never be completely united, while the ſoil remains in an open unincloſed ſtate. When the fields are in graſs they cannot be paſtured to advantage without fences; and when they are in tillage, the crops, of whatever kind they may be, are expoſed to every injury that can be ſuffered from the encroachments of ſheep, cattle, or other animals. In many of the counties throughout the kingdom, the features of this improvement are ſtrongly marked, and the ideas of ſhelter, ornament, and increaſed produce, are viſible to even the moſt ſuperficial obſerver, and afford a very juſt comparative eſtimate of the advantages to be derived from incloſing, by contraſting the value of lands that are incloſed with others of the ſame quality that ſtill remain in an open field ſtate; the ſaving in point of labour, the perfect ſecurity to the crop while the lands are under tillage, together with the warmth and ſhelter afforded to the ſtock and herbage when the fields are in paſture, form a ſtriking contraſt when compared with the open, unſheltered, unprotected, and unproductive ſtate of unincloſed fields. Obvious as theſe advantages are, it is to be regretted that the ſyſtem of incloſing has, in too many inſtances, met with much oppoſition; and even in thoſe caſes where its benefits are clearly aſcertained, much difference of opinion ſtill exiſts, with regard to the nature of the fences requiſite for different ſituations, the materials or plants that ſhould be uſed, the beſt mode of executing them, and the ſeaſon of the year moſt ſuitable for doing the work. The oppoſition ſo often made to bills of incloſure brought into parliament is a very ſtriking proof of the former; and the little judgment that is ſhewn in accommodating the fence to the natural circumſtances of the fields to be incloſed is concluſive as to the latter. It too often happens that proprietors and farmers, without duly conſidering either the nature of their ſoil or its local ſituation, reſolve upon and adopt a mode of incloſing which they have ſeen ſucceſsful in other places, without once conſidering that the ſoil, climate, and other circumſtances, which combined to render the plan ſucceſsful in the ſituations they wiſhed to copy, are totally wanting in theirs. Owing to this much money is expended and many attempts prove abortive; the ſyſtem of incloſing falls into diſcredit, and is conſidered as impracticable in many caſes where good and laſting fences might be reared at the ſame, perhaps leſs, expence than ſuch as have failed. The reaſon commonly aſſigned is the rigour of the climate, while the true and only cauſe is, the ignorance or want of diſcernment in the perſons who make theſe unſucceſsful attempts.

Indeed the miſtakes committed in this way are innumerable. Sometimes live fences are planted in ſituations, and upon ſoils where it is impoſſible they can grow, far leſs arrive at perfection; and where ſubſtantial ſtone fences could be made, not only at little expence, but the building of which, by collecting the ſtones, would rid the adjoining ſurface of a nuiſance, and remove an incumbrance which too often conſtitutes a material bar to its cultivation. The diſcernment neceſſary to diſcover this is not great; notwithſtanding which, we too frequently have occaſion to obſerve large fields incloſed, either with dwarfed, crabbed, ill-grown hedges, and rotten decayed palings, or with turf or earthen mounds, obtained by paring off the beſt part of the ſurface-ſoil; while the fields thus wretchedly incloſed by fences, which, on account of their inutility and periſhable nature, muſt one day be abandoned, are covered with numerous large ſtones, the removal of which is an eſſential requiſite to their improvement. The ſame circumſtance often happens where live fences might be reared, which, in every inſtance where they can be brought to perfection, are to be conſidered as preferable to any other. In place of making the hedge with ſuch plants as are ſuited to the ſoil and climate, they are often directly oppoſite—dwarf, ſtinted, white thorn hedges being very frequently ſeen upon cold wet lands, and in bleak expoſed ſituations; upon which, if beech, black-thorns, or crabs, had been planted, they would have grown readily, and made complete fences in a very ſhort time. In other inſtances the fence fails, or becomes faulty, from circumſtances which the planter may be diſpoſed to conſider as immaterial. For example, in incloſing a large field, a great part of the outline of which is wet, if white-thorns are planted in the ordinary way upon the common ſurface, they will never make a good fence; whereas by planting them in the face of the bank of earth thrown out of the ditch, being thus raiſed above the level of the field, and placed upon a dry bed, they thrive, and ſoon eſtabliſh themſelves; while upon very dry lands, with open bottoms that poſſeſs little capacity for retaining moiſture, the hedge very often dies from an oppoſite cauſe. When the plants are ſet upon the mound raiſed above the common ſurface, if the ſeaſon is but commonly dry, their growth is conſiderably impeded from the want of moiſture; and in ſevere winters, from the porous nature of the ſoil, the froſt gets acceſs to the roots, and either kills whole rows or lines of hedges in a few weeks, or ſo far hurts them as to check their future growth and improvement.

And it is ſtated, that in peruſing the different county reports, all the ſurveyors concur in opinion as to the utility of incloſures; but that it is mentioned by ſeveral of them, in terms of regret, that the obſtacles thrown in the way of this valuable improvement, by ignorance and obſtinacy, are great and manifold. In ſome caſes they ſpeak in terms of the higheſt panegyric of the utility, cheapneſs, and durability of certain fences, ſuch as quicks, beeches, crabs, &c. when they are planted upon the ſoils to which they are reſpectively the beſt adapted; while in others they mention, in pointed terms, the periſhable nature and tranſitory value of many of the fences employed, the annual expence required to keep certain deſcriptions of them in repair, (the dead hedges and palings,) and the great extent of valuable ground that is occupied by the others, eſpecially the incloſures made by double ditches with a bank between them and a hedge on each ſide, and of the common hedge and ditch, and hedge and bank, which, at the ſame time that they occupy a conſiderable ſpace of ground, are very ſeldom good fences, in ſome inſtances covering thrice, and in others four times the ſpace that a fence of a different kind would do, if properly kept. Great contrariety of opinion alſo prevails in regard to making trees a part of the incloſure, either in hedge-rows or belts of planting. From ſuch diverſity and oppoſition of ſentiment, it is difficult to form any fixed or certain opinion upon the ſubject in queſtion.

The different points to which the proprietor or occupier ought to pay particular attention, before he commences any plan of incloſure, would ſeem to be

1ſt. The nature of the ſoil.

2dly. Its preſent worth, and the increaſe of value expected from incloſing it.

3dly. The objects to be attended to in making incloſures; and whether the greateſt value of the fences is expected to ariſe from their ſimply confining their ſtock, or from their affording ſhelter to both ſtock and crop, or from the union of ſhelter and incloſure.

4thly. The modes of incloſure ſuited to the natural circumſtances of the ſoil, climate, &c.

5thly. The materials for making the fences, and the means of obtaining them. And,

6thly. Expence, which is another important point to be conſidered, but which muſt depend upon ſo many local circumſtances, that it is impoſſible to form any eſtimates that could be of much ſervice in guiding the improver.

Nature of the Soil.—In reſpect to this, a careful inquiry ſeems to be one of thoſe requiſites eſſential to the ſucceſs of every plan of incloſure; for though there are, comparatively ſpeaking, few ſituations, however elevated above the level of the ocean, and ſcarce any deſcription of ſoil, where a good live fence may not be reared, with one ſort of plant or another, yet it is an object of the firſt importance to know the plants beſt ſuited to every variety of ſoil, as, by a judicious choice of theſe, much loſs and difficulty is avoided, and good ſubſtantial fences are made in a ſhort time, and in many ſituations where, from a miſtake as to the plants employed, the fence has languiſhed for years, and ultimately periſhed, notwithſtanding every care that could be beſtowed upon it. In ſome inſtances, we have known twenty years experience barely ſufficient to undeceive thoſe who had made miſtakes of this kind. In a few caſes, however, where this obſtinacy has given way to common ſenſe and obſervation, and where the plants of which the hedge was originally made have been taken up, and others better adapted to the ſoil ſubſtituted in their room, theſe laſt have, without much trouble, made a good fence in a very ſhort ſpace of time, and with very little trouble.

It is well known that white-thorns, or quicks, as they are commonly called, are reared with great eaſe, and, under proper management, ſoon make uſeful and handſome fences upon all dry ſoils, provided the ſituation is not too high and expoſed. In ſuch places, though the plants do not periſh entirely, they never attain the ſtrength or vigour neceſſary to make a good fence. In caſes where the natural ſurface of the ground is rather too moiſt for white-thorn, the exceſs of damp may be carried off by a ditch on one ſide of the plants in the uſual way. In marſhy ſituations, where a ditch on one ſide would be inſufficient to lay the ſoil dry enough for the ſucceſs of white-thorns, it ought to have a drain on each ſide of the bank on which the thorns grow, and which would be particularly favourable for the growth of aſh-poles and various other ſorts.

But in every caſe where thorns are planted upon the common ſurface without a ditch, and upon dry ground that has been previouſly prepared by dung, lime, &c. they grow better than where ditches are uſed, becauſe the ditches ſerve as open drains to carry off the moiſture, a circumſtance which in dry ſeaſons is often very detrimental to the growth of the hedge. Except in weeding, the thorns ſhould not be touched for the firſt four or five years of their growth, unleſs it be to crop the moſt luxuriant of the lateral ſhoots: at the end of that time they ſhould be completely trimmed and put into ſhape, leaving the top ſhoots untouched, till the hedge attains the neceſſary height; when this ought alſo to be cut over, and its farther growth upwards prevented by regular yearly cuttings afterwards. See FENCE and HEDGE.

And black-thorns, crabs, &c. may frequently be treated in nearly the ſame manner as the white-thorn. There is, however, one remarkable difference between them, which is, that both the crabs and black-thorns will thrive, and become good fences, in ſituations where the white-thorn would periſh: upon *tills* and clays, for example, many fields of that deſcription are completely incloſed with them, which could never have been rendered fencible if white-thorns had been employed. Alſo, the holly, when properly attended to, forms a thick and beautiful fence, and has an advantage over moſt others in affording the ſame degree of ſhelter at all ſeaſons. It grows well upon all ſoils, but particularly upon deep and moderately dry loams. Its progreſs is, however, ſlow, even in the moſt fortunate ſituations, which renders it unfit for common uſe; unleſs in pleaſure-grounds, or places where taſte or fancy requires it. When intermixed with the white-thorn it is, however, more rapid in its growth, and forms a moſt beautiful kind of fence.

But the uſe of beech, for the purpoſes of fences, has not hitherto been very common; they are, however, faſt coming into uſe, and perhaps will ſoon be the only kind employed in the uplands, or upon the cold wet ſoils in the lower diſtricts of the kingdom; for theſe ſituations, ſo far as the experience of ſeveral parts of Scotland can aſcertain that point, they are, it is ſaid, remarkably adapted. In Eaſt Lothian there are ſeveral tracts of land, the ſoil of which is of a very inferior quality, that have had their value greatly increaſed, by incloſing them with beech hedges, upon which thorns were formerly tried without ſucceſs, and much trouble and expence incurred in the attempt; while the beeches, which originally coſt no more than the thorn, without any trouble, very ſoon become good fences. Along with their growing ſo readily in theſe unfavourable ſituations, they poſſeſs a property well ſuited to a cold or expoſed country; namely, that of preſerving their leaves through the winter, and indeed till an advanced period in the ſpring; by which they afford ſhelter to the grazing ſtock, and alſo to the paſture in the early part of the ſeaſon, when it is apt to be hurt by the cold, nipping, froſty winds. The birch is likewiſe peculiarly adapted to cold clays, where it ſeldom fails to thrive, and form a good fence; ſome caution, however, is neceſſary as to the management of it. It is alſo ſaid to be the only plant which ſucceeds in the ſandy rabbit-warren land, ſuch as is found in ſome parts of Suſſex. In all caſes where it is intended to cut or plaſh it, the operation ſhould be done about the end of autumn, as the juices are at that time retiring to the root, and long before the circulation is again renewed the wounds are healed: whereas, when the cutting is deferred till the ſpring, or beginning of ſummer, when the circulation is going on, the juices flow out by the wound, and continue to run off in that way during the whole of ſummer; by which means the plants are ſo weakened and exhauſted, that many of them die, a misfortune which is entirely prevented by cutting about the end of autumn, or during the winter ſeaſon.

Upon all wet or marſhy grounds, willows, alders, and poplars thrive, and are extremely uſeful in completing incloſures in many ſituations, where other plants would either periſh entirely, or remain in a dwarf ſtinted ſtate. In Huntingdonſhire, and ſeveral of the fenny parts of England, theſe plants, in conjunction with the alder, form almoſt the only deſcription of live fences that are met with: their value in thoſe parts is well known; and in every ſimilar ſituation throughout the kingdom, if proper trials were made, they would be found equally uſeful. Hedges made with willows have an advantage over almoſt every other, as, after the hedge has arrived at a certain height, and is properly laid down and bound together, the young ſhoots may be annually taken off, and ſold to baſket-makers for a conſiderable ſum of money. They have another obvious advantage, namely, the eaſe with which they are propagated, being raiſed by ſimple cuttings, without any other trouble than that of merely ſticking them into the earth. Where this is practiſed, and in moſt ſituations it may be done with great eaſe, the farmer or proprietor will not only have his fields incloſed, but the fence will be converted into a ſource of revenue, by the ſale of the young ſhoots yearly. Where the Huntingdon willow is uſed, a farther emolument may ariſe to the proprietor, by allowing a certain proportion of the plants to run up into trees; with very little care they ſoon arrive at a great ſize, and are of conſiderable value; the wood is ſoft, eaſily wrought into any form, takes a fine poliſh, and can be ſtained of any colour. The uſe of willows, poplars, &c. is not confined ſolely to wet or marſhy grounds, they thrive upon almoſt every ſoil, and, indeed, make more progreſs upon ſuch as are moderately dry than upon very wet lands; upon the latter, however, they grow better than any other plant, and on that account deſerve a preference in many caſes.

And the hazel, elder, &c. are plants which grow well upon all dry ſoils, and, if properly managed, by laying wattling, &c. produce wood enough to form a very ſufficient fence; but their want of prickles render them leſs eligible than thorns. The elder poſſeſſes a property which, along with the beauty of its flowers, will give it a preference to moſt other plants in many ſituations; namely, that of its being propagated from cuttings, with as much eaſe as the common willow. Where the hazel is uſed for incloſing with, and the proprietor is diſpoſed to take the neceſſary trouble, it may be rendered very uſeful, by cutting the hedge within four feet of the ſurface every ſecond or third year, and ſelling what is cut off to coopers or baſket-makers: hazels are well known to make the beſt and moſt durable hoops, and generally bring a high price for that purpoſe in moſt ſituations.

Though the larch has not hitherto been much uſed as a hedge plant; yet, from its growing ſo readily, and bearing the operation of clipping ſo well, it ſeems very much adapted for that purpoſe. In expoſed ſituations, where thorns would fail, the larch would be found an excellent ſubſtitute, and many fields may be incloſed with it that would otherwiſe remain open. Where it is intended to incloſe a field with larches, the plants made uſe of ſhould be at leaſt ſeven years old, and the ſtrongeſt that can be obtained of that age. They ſhould be taken up in the moſt careful manner, preſerving the whole of the roots, and planted in a trench where a conſiderable quantity of dung or compoſt has been put. The moſt proper ſeaſon for this operation is about the end of November, or in the early part of January; at either of which periods, if they are carefully lifted, and replanted without any deſtruction of the roots, they will ſuffer no check whatever, and grow readily and vigorouſly in the ſpring. It is worthy of notice that the tops ought never to be allowed to exceed the height of ſix feet; becauſe, after they paſs that height, the wind has ſo great an effect upon them as to deſtroy any binding that may be made with their lower branches; cutting the tops has alſo another beneficial effect, namely, that of making them puſh out more vigorouſly below. Larches have, however, one defect, in common with hazels and ſome other plants, namely, the want of prickles, which certainly impairs the value of any fence made with them; as neither ſheep nor cattle are diſpoſed to reſpect any hedge ſo much as thoſe that are made with plants of the prickly kind.

The whin, or furze, is alſo a plant that is known to grow ſpontaneouſly, and attain a great ſize upon ſoils and in climates where ſcarcely any other would live. In all caſes where whins are found growing naturally, and of any conſiderable ſize, hedges of them may with ſafety be attempted: but as the whin ſeldom grows to any conſiderable height, hedges are not often made with it. This material, however, forms a good fence when a ſufficient number of plants can be reared and brought to perfection; and, from its numerous prickles, very effectually prevents both horſes, ſheep, and cattle, from attempting to break through it. It has, however, one defect, and that is conſiderable; being raiſed a good deal above the common ſurface, the plants are expoſed to many accidents, ariſing from drought, froſt, &c.; accordingly it often happens in ſevere winters, that whole lines of whin hedges are killed at once, and of courſe much labour and expence thrown away.

There are, beſides theſe, ſeveral other kinds of plants, ſuch as the bramble, mulberry, &c.; and various ſorts of fruit trees and ſhrubs, ſuch as the gooſeberry, &c. that may be occaſionally employed in the ſame intention with advantage, though they have not yet been much had recourſe to in ſuch a view.

Preſent Value of the Soil, and the Improvement of it by Incloſure.—It may be remarked that in every plan of improvement, whether by incloſing or otherwiſe, it is very material to aſcertain the preſent worth of the land, and the probable increaſe of value that may be expected from the undertaking; for unleſs this point is judiciouſly weighed, the operations will proceed at random, and much labour and expence may be incurred without any adequate advantage reſulting therefrom. For much and juſtly as the advantages of incloſing are extolled, (and they are unqueſtionably great,) there are certain circumſtances of ſoil and local ſituation that bid complete defiance to this and every other attempt at improvement. For example, in high rocky ſituations, where the ſoil is not only thin, but of a bad quality, where the lands can never be ſubjected to the plough, and where the herbage is not likely to be much ameliorated by ſhelter, little benefit will be derived from incloſing. The only advantage reſulting from the practice in ſuch caſes ſeems to ariſe from the ſaving of a ſhepherd's wages, which, when the ſtock are paſtured in an incloſed field, is rendered unneceſſary; but which, if accompanied with no other advantage, will be found a paltry equivalent for the expence of incloſing the ſoil. On the contrary, however high or expoſed the ſituation may be, if the ſoil is of a good quality, and a ſpecies of plants can be met with of a nature ſo hardy as to bear the climate, the value of the property will be ſo far improved by the ſhelter ariſing from the fence, as amply to compenſate the expence incurred in making it. In many of the bleakeſt and moſt expoſed ſituations in Britain, the ſoil, though greatly elevated above the level of the ocean, is equal in quality to what is met with even in the moſt favoured ſituations, and for the moſt part requires nothing but ſhelter and judicious culture to render it highly valuable. In detailing the different kind of fences, eſpecially that known by the name of hedge and belt of planting, an opportunity was taken of pointing out ſeveral inſtances, where the mode of incloſing has benefited the property ſo incloſed, in a tenfold proportion, in a very few years. Upon this point it remains only to hint, that every perſon, whether proprietor or farmer, ſhould, before he commences his operations, pay very particular attention to the preſent value of property in an unincloſed ſtate, and the extent to which it may be improved by incloſing; as without ſuch previous knowledge, in place of being repaid by the pleaſure ariſing from ſeeing the property ornamented and improved in proportion to the trouble and outlay of money, large ſums will often, it is ſuppoſed, be expended, without adding to the general appearance of the country, or materially contributing to augment the value of the ſoil and property.

Objects to be regarded in forming Incloſures.—It may here be noticed, that, in ſome ſituations, all that is required is merely the confinement of the ſtock, in others, ſhelter to the ſtock and herbage are the principal objects; but in a great majority of caſes, the union of both is neceſſary to complete the ſyſtem of incloſing. In wild low ſituations perhaps a ſtone wall, or a low thorn fence, will anſwer every purpoſe required, and produce every benefit that could be expected from the incloſure; yet theſe fences would be found totally incompetent to the purpoſes of incloſure in the hilly and upland parts of the country; for, though confining the ſtock might be completely anſwered by either, the important requiſite of ſhelter would be entirely wanting. Other matters of equal importance ought to enter into the conſideration of perſons incloſing. The ſeparation of the ſoils incloſed, ſo as to render that of each field as nearly as poſſible of an uniform quality, the ſeparation of ſtock as may be thought moſt adviſable, together with the ſecuring a ſufficient ſupply of good water, are requiſites ſo eſſential to the ſucceſs of the undertaking as to entitle them to a high degree of attention. Mr. Donaldſon, in ſpeaking of incloſures, ſays, that the old fences were planned with a view chiefly to incloſe ſoils as ſimilar as poſſible within each diviſion; beauty or regularity does not, he thinks, ſeem to have attracted much of the proprietor's or farmer's attention; utility, it would appear, they kept principally in view. Our modern improvers, on the other hand, in too many inſtances at leaſt, ſhew an evident diſpoſition to ſacrifice utility to taſte and regularity in appearance. Hence, it is not uncommon, in a new incloſed pariſh in England, or even in an eſtate in Scotland, where the proprietor has the ſole power of management, to ſee ſeveral different ſorts of ſoils in the ſame incloſure, which, with proper attention, and a little ſacrifice of taſte, might have been included in the adjoining fields with much greater propriety. Thus, in place of forming the fences in ſuch directions as that the greateſt advantage might have been derived, by not only incloſing and ſubdividing the eſtate, but alſo by ſeparating, in every poſſible caſe, ſoils of different and oppoſite qualities, it not unfrequently happens, that the ſands of Norfolk and the clays of Lincolnſhire are, as it were, incloſed within the ſame fence; than which it is impoſſible to figure any management more improper. If a regular rotation of cropping be adopted on a farm where each incloſure contains a variety of ſoils, it will of courſe be ſuited to that ſort which moſt prevails. When the moſt prevalent ſoil is of a light and ſandy nature, the portions of better ſoil contained in each incloſure muſt be cultivated under a ſyſtem, in regard to cropping, not the beſt calculated to produce the greateſt returns. On the other hand, when the predominant ſoil is deep and fertile, that of a lighter nature muſt be exhauſted, were a mode of cropping purſued calculated only for the ſoil of ſuperior quality. Whereas, had a judicious arrangement been made in regard to the form of the incloſures, the good and bad ſoils might, in many caſes, have been kept ſeparate; and, as often happens, two rotations of cropping adopted on the ſame farm with equal propriety. Perhaps alſo fences in ſtraight lines, in place of curves, might be diſputed on the ſcore of taſte; but that is a queſtion foreign to the object of the preſent inveſtigation, which has utility only for its object.

The new incloſures differ as much from the old in regard to ſize as in form. The old incloſures generally contain from three or four to ſix or eight acres; few of ſuch as can be properly denominated old exceed ten; while thoſe that have been formed in latter times extend from ten to twenty, ſometimes to forty or fifty. This difference in the ſize of incloſures is greatly, if not entirely, owing to the change of opinion in regard to what was and what now is conſidered by individuals as the proper ſize of farms. In the ſame, or nearly the ſame proportion as farms were enlarged, ſo were the dimenſions of the new incloſures. The more ancient incloſures, ſuch as thoſe in ſeveral parts of Eſſex, Kent, Suffolk, &c. are evidently too ſmall, while thoſe in many other diſtricts are too large. There is a medium in regard to the ſize of incloſures, as well as in other things; and to diſcover and adhere to it, as nearly as circumſtances will allow, is certainly for the intereſt of the proprietors, the tenants, and the public. Where the incloſures do not exceed three or four acres, the quantity of land taken up in erecting the fences is a very heavy *per centage*, viewing the incloſure as a part of the farm, of the eſtate, or of the national territory. A free circulation of air is alſo prevented, eſpecially if there be hedge-row trees, to ſuch a degree, that it may be difficult to ſay whether the crops are more benefited or injured by the fences when ſo cloſely placed. As one of the moſt important advantages that can be derived from incloſing is ſhelter, large incloſures muſt, on the other hand, be equally improper. When a tract of thirty or forty acres is included within one fence, it would be abſurd to ſuppoſe that the fence can afford the ſame ſhelter as if theſe thirty or forty acres had been ſubdivided into three or four fields. When the incloſures are made ſo large, the advantage of fencing, in ſo far as regards ſhelter, muſt be merely a ſecondary object with the perſon who erects the fence.

Having pointed out the loſs and inconvenience ariſing from too ſmall and too large incloſures, it may be neceſſary to ſuggeſt what, upon the whole, ought to be conſidered the beſt ſize. This it is propoſed to do on the authority of Mr. Bakewell, from whom the Britiſh farmer might have learned many uſeful leſſons on ſubjects connected with huſbandry. Beſides what related more eſpecially to the improvement of the different ſpecies of live ſtock, it was the opinion of that expert farmer, that fifty acres of paſture, divided into five incloſures, would go as far in grazing cattle as ſixty acres all in one field. If there was a man in the iſland that exceeded another in knowledge as a breeder and grazier, it was Mr. Bakewell; his opinion, therefore, founded on the experience of many years, may be conſidered as concluſive in regard to the proper ſize of incloſures, in ſo far as the breeder or grazier is concerned; and from what is above ſtated, it appears that from eight to twelve-acre fields are beſt calculated for either of theſe purpoſes. Mr. Marſhall alſo, in corroboration of this, hints in his "Rural Economy of Glouceſterſhire," that the moſt experienced dairy farmers in that diſtrict conſider what he calls a ſuit of paſtures as a more profitable mode of paſturing cows than one large incloſure. As no farm can be kept conſtantly in tillage with advantage, and as the beſt mode of cropping that can be adopted for the generality of ſoils is, in his apprehenſion, that by which nearly the one-half of the farm is in tillage, and the other in paſture, it is neceſſary, in determining the proper ſize of incloſures, to have regard to the two great branches of huſbandry, namely, grain and graſs. In regard to the latter, ſo far as the practice of the two counties moſt remarkable for grazing and dairying can go, the matter ſeems determined; and in reſpect to corn huſbandry, as middle-ſized incloſures enjoy the advantage of ſhelter to a greater degree than thoſe of larger ſize, and a more free circulation of air than thoſe of ſmall dimenſions, there can be no reaſon to heſitate in determining, that the ſize of incloſures beſt ſuited for the breeder, the grazier, and the dairyman's purpoſes, will alſo beſt anſwer thoſe of the cultivator of grain.

Modes of incloſing ſuited to the natural Circumſtances of the Soil, &c.—It is ſtated by Mr. Somerville, in the work already mentioned, that this matter has been in ſome degree diſcuſſed in the preceding article of incloſure. There cannot, however, remain a doubt that the ſucceſs of every attempt that is made in the way of incloſing muſt in a great meaſure depend upon the diſcernment of the perſon who undertakes it. A material conſideration in ſuch caſes is, to determine whether live or dead fences are the moſt eligible or beſt ſuited to the natural circumſtances of the ſoil. The former comprehends every fence made with growing plants; the latter includes not only the different kinds of wall or dike made with dry ſtone, ſtone and lime, ſtone and clay, turf, &c. but alſo the different kinds of dead hedges and palings. Into this eſtimate ought alſo to enter the comparative uſefulneſs and durability of each, together with the firſt coſt. In general, the firſt claſs, namely, live fences, where the plants are properly choſen, and well adapted to the ſoil, are uniform in this reſpect, that, under proper management, their value is yearly increaſing: while that of even the beſt-conſtructed dead fences is annually growing leſs. Where they conſiſt of dead hedges or palings, their decay is certain, and commonly rapid; and even when they are conſtructed with ſtone and lime, which are by far the moſt durable of that claſs; though they make perfect fences at once, and the proprietor or occupier enters into immediate poſſeſſion of every advantage that can ariſe from them, yet from the hour they are built their decay commences, and, after the firſt few years, a regular and progreſſive expence is incurred to keep them in repair in a proper manner.

It is aſſerted, that in all upland ſituations, the firſt claſs of fences will be found the beſt: of that claſs, however, the beech hedge, and hedge with a ſlip of planting, deſerve a preference, as they unite in the higheſt degree the important requiſites of ſhelter, ornament, and incloſure. The beech, under proper management, attains a great ſize even upon the pooreſt ſoils, and ſoon forms a uſeful fence in ſituations where thorns and other kinds of hedge plants would either periſh or remain in a dwarfiſh ſtate; with this additional material advantage, that, by keeping its leaves during the winter, it affords ſhelter to the ſtock and paſture at the moſt inclement ſeaſon, and when it is moſt wanted. The incloſing fences in theſe ſituations ſhould likewiſe be high in order to produce the greateſt effect and utility. But that in low ſituations, where little is to be apprehended from the want of ſhelter, thorn hedges kept low, or any of the different kinds of ſtone walls, will anſwer every purpoſe; and as the ſoil in theſe low ſituations is for the moſt part of very great value, thoſe fences, from the little ſpace they occupy, will be found preferable to every other kind.

Materials for forming the Fences, and the Means of providing them.—In ſpeaking of the nature of the materials for making fences, in the above obſervations upon the modes of incloſing ſuited to the natural circumſtances of the ſoil, it has been pointed out what appeared the beſt, upon the ſuppoſition that the materials could be readily obtained at a reaſonable price. In many ſituations, however, the ſcarcity and apparent want of many of theſe materials form an almoſt inſuperable obſtacle to incloſing upon the plan above hinted at. For inſtance, in the remote parts of the kingdom, where the different kinds of trees and hedge plants are either very ſcarce, or not attainable but at an enormous price, it will often be found neceſſary, in the incloſing of upland diſtricts, to ſurround the fields with ſtone walls in place of hedge, or hedge and ſlip of planting; and in not a few ſituations in the low lands, where ſtone walls would be the moſt eligible fence, from the ſcarcity of that article, hedges, or hedge and ditch, are had recourſe to. Under ſuch circumſtances neceſſity is the law; and the perſon incloſing muſt accommodate his plans to his reſources. It will, however, frequently happen, that the materials wanted will be met with upon the ſpot, not only without expence, but with much advantage to the property; as in caſes where the fields are infeſted with ſtones, their removal will at once facilitate the improvement of the field, and furniſh good materials for incloſing it. But even where the reſources are leſs viſible, and there are no ſtones upon the ſurface, by a careful examination of the ſub-ſtratum plenty may often be met with; or, in defect of theſe, clay for making either bricks or mud-walls may be had merely for the trouble of digging or getting it up.

In forming other kinds of dead fences for incloſing lands, ſuch as palings, hedges, &c. materials for conſtructing them may be procured in almoſt any ſituation, from the thinnings of young plantations, from coppices, and the cutting down of old hedges; even the deficiency of hedge plants and young trees might be, in a great meaſure, if not entirely, got the better of, if every proprietor were to have a ſmall nurſery for raiſing them for his own uſe, and that of his tenants. To the convenience and ſaving of expence with which this practice would be attended, we have to notice an unſpeakable advantage, namely, that ariſing from the uſe of plants propagated in, and inured to, the climate where they are afterwards to grow. It muſt require little knowledge of the ſubject to convince any one, that plants, of whatever kind, reared in the upland and hilly parts of the kingdom, will thrive better than ſuch as have been reared in the warmeſt and moſt ſheltered ſpots. To what, it is aſked, are we to aſcribe the amazing ſize and luxuriant growth of many trees in the iſlands of Scotland, or even in Norway or North America, but to the circumſtance of their having come into exiſtence in the climate and ſituation where they were afterwards deſtined to grow; and by being thus early inured to the climate, became, to all intents and purpoſes, indigenous plants.

It may in addition be remarked, in regard to adapting the plants to the ſoil, that it is not the leaſt important conſideration with perſons incloſing, after having determined whether live or dead fences ſhould be uſed, to make choice of the plants beſt ſuited to the ſoil. In the flat low parts of the country, where the ſoil is loamy or gravelly, and at the ſame time moderately dry, and not greatly expoſed to any prevailing winds, white-thorns will be found both the cheapeſt and the beſt. Hazel, elder, and a multitude of others, might be uſed for that purpoſe in theſe ſituations; but they are liable to objections to which the thorn is not. If in theſe low ſituations it is meant to plant trees along with the fence, either in hedge rows or belts, the dry ſoils ſhould, it is obſerved, be planted with oak, aſh, elm, plane-tree, cheſnut, beech, &c. and the moiſt parts with poplars, and the different kinds of willows; by ſuch means the whole will thrive, and in a ſhort time become valuable to the proprietor. In the upland and hilly parts of the country, unleſs the ſoil is wet indeed, the hedge plants ſhould conſiſt either entirely of beeches, or a mixture of beech and larch; the laſt is known, as has been ſeen above, to anſwer well in theſe expoſed ſituations, and not only endures planting and clipping without injury, but thrives remarkably under theſe operations; where the ſoil, however, is wet or ſpongy, a different deſcription of plants ſhould be uſed; willows of different kinds, poplars, birch, or alder, will then be found the beſt, and ought, in preference to every other, to be made uſe of. By thus adapting the plants to the ſoil and climate, few plans of incloſure will prove abortive in any ſituations ſo far as the fencing it is concerned.

Expence of performing the Work.—It is obvious that this muſt be extremely various according to the nature of the ſituation and other circumſtances; but it will ſeldom be very great where due care is taken in the direction and execution of the buſineſs, and the neceſſary materials are capable of being had near at hand, and in ſufficient abundance.

From the peruſal of the different ſurveys now in poſſeſſion of the Board of Agriculture, it would appear, that, in almoſt every county throughout the kingdom, conſiderable tracts of the ſoil are incloſed; and that many plans of additional incloſures, to a very conſiderable extent, are now in contemplation. The ſurveyors appointed by the Board are unanimous in their approbation of the ſyſtem, which they repreſent as ſo beneficial in its conſequences, that in many caſes the value of the property has been thereby increaſed in a fourfold proportion, and, in ſome well-authenticated inſtances, conſiderably more. The incloſing fences at preſent in uſe are of great variety; and a part of them, particularly ſuch as have been made of late years, executed in a handſome ſubſtantial manner, uniting at once the important points of ſhelter, incloſure, and ornament. The appearance of theſe, owing to the judicious manner in which they are managed, convey to the mind the ſtrongeſt ideas of permanent and valuable improvement. The different kinds of ſtone-walls, by having a broad foundation ſunk deep enough in the earth to place them beyond the reach of froſt, tapering gradually upwards, and ſecured at top with a proper coping, are found to laſt many years, with but very ſlight repairs. The hedges, from the circumſtance of their being planted at a proper ſeaſon, the plants made uſe of adapted to the nature of the ſoil, and afterwards kept in order by regular weeding and trimming, are of immenſe value, and form the moſt beautiful and laſting fences that can be imagined. Many other deſcriptions of fences are equally perfect and valuable; but though theſe circumſtances are mentioned with much ſatisfaction, and muſt give pleaſure to every perſon who feels, or has the ſmalleſt intereſt in the improvement or welfare of his country, it is with pain remarked, that in too many inſtances the ſyſtem of incloſing is extremely defective; and much leſs ſolicitude has been ſhewn to ſecure and unite the whole of the benefit to be derived from it, than the importance of the ſubject deſerves. To confine the ſtock ſeems, in too many inſtances, to have been the ſole object; while the weightier matters of ſhelter, both for the ſtock and paſture, ſeparation of ſoils, ſeparation of ſtock, and many other points of equal importance, have been entirely overlooked. In too many inſtances, no attention has been paid to the natural circumſtances of the ſoil intended to be incloſed. High inacceſſible walls, belts or ſlips of planting, and hedge rows of trees, being very often met with in the loweſt and warmeſt ſituations, where little or no ſhelter is neceſſary; while in the hills and uplands, and along the ſea-coaſt, where ſhelter is indiſpenſable, both for the ſtock and paſture, and where its advantages are incalculable, the fence very often conſiſts of a naked ſtone wall, which, though it may, and indeed does anſwer the purpoſe of confining the ſtock, poſſeſſes no other advantage; and many tracts of immenſe extent, the value of which might be improved in a tenfold proportion by hedges and belts of planting, exhibit a naked bleak appearance, and continue expoſed to every blaſt. The loſs and diſadvantage attending this injudicious mode of incloſing are ſtrikingly obvious. In the low warm parts of the country, where the land is of immenſe value, much of it is occupied by fences which the nature of the ſituation does not require, while in the more elevated and expoſed parts, where ſhelter is the *ſine qua non* of improvement, and where the land occupied by the fence is, comparatively ſpeaking, of ſmall value, the fence, in place of affording the neceſſary ſhelter both to the ſtock and paſture, is barely adequate to the purpoſe of incloſing the field. Under ſuch circumſtances, the paſture will for the moſt part be ſcanty;

ſcanty ; and neither a breeding nor a feeding ſtock will make half the progreſs upon it that they uſually do in caſes where they enjoy the benefit of complete ſhelter. A defect equally injurious to the proprietor or occupier, and highly inimical to permanent improvement, ſeems alſo to prevail in the choice of the materials of which incloſures are generally made. In every inſtance where circumſtances will admit of it, preſent uſe ought, if poſſible, to be united with durability in the formation of every fence ; an attention to this is, however, too often totally wanting, both with proprietors and farmers. Provided the preſent purpoſe is anſwered, future conſequences are diſregarded ; and neither a knowledge of the periſhable nature of the materials made uſe of, which daily experience preſents to their view, nor the frequent and heavy expences to which they are put for repairs, have been ſufficient to make them alter their ſyſtem. Amongſt theſe periſhable fences are to be ranked the different kinds of earthen and mud walls, of turf, of turf and ſtone, together with the whole of the wooden fences, comprehending the different kinds of paling, dead hedges, &c. It is added, alſo, that the ancient cuſtom of incloſing fields with high earthen banks or mounds, ſometimes with and ſometimes without a paling on the top, which prevailed formerly in many parts of England, and which is now purſued in the north of Scotland, though it did very well as a rude eſſay in the way of improvement, when other modes of incloſing were either unknown or imperfectly underſtood, and might for a time anſwer the purpoſe, either of confining the grazing ſtock while the field was in paſture, or protecting the corn crops when it was under tillage, is perhaps the worſt and moſt periſhable of all incloſing fences. After being reared with much labour, and committing a theft upon the adjoining ſurface, which is pared off to a conſiderable diſtance on each ſide, it remains but a very few months, or even weeks, in a perfect ſtate ; indeed, from the moment it is made it begins to decay : and the operation of the weather upon it, for a few years, renders it uſeleſs as a fence. Accordingly in many parts of the iſland the remnants of ſuch fences are met with, which, though they were originally of conſiderable height, and to appearance ſtrong and formidable, are now ſo compleatly beat down and levelled by the action of the weather, as to render it in ſome caſes a matter of difficulty for the curious to trace their foundations, or the direction in which they formerly ran. The caſe is the ſame with walls formed entirely of turf, or a mixture of turf and ſtone. Theſe, though made at conſiderable expence, and, as has been already noticed, by robbing the neighbouring ſurface, are equally periſhable as the ſimple earthen mound. Upon whole farms, and even eſtates, that were formerly incloſed with turf, or ſtone and turf walls, nothing now remains but their veſtiges, which, while they exhibit a ſtriking proof of their periſhable nature, afford at the ſame time a ſalutary leſſon to proprietors and others, to beware of ſuch temporary expedients ; as, however cheap ſuch fences may be in the firſt inſtance, in their beſt ſtate they are but imperfect, and in the end are the worſt and moſt expenſive of any. An equal defect, it is aſſerted, prevails in many inſtances where the incloſing fence is entirely of ſtone. When the walls, in place of having a good foundation ſufficiently removed beyond the reach of froſt, broad at bottom, tapering gradually upwards, and finiſhed at top with a ſubſtantial coping of flag-ſtones and lime or turf, ſo formed as to prevent the decay of the building, are in many inſtances built upon the plain ſurface, with ſcarce any taper towards the top, and without any coping at all, except perhaps a ſlight one of turf, which ſoon moulders away, and, if the wall is built with lime or clay, permits the moiſture to ſoak down and deſtroy it. The ſame improvidence and want of judgment diſcovers itſelf in carrying theſe walls through every kind of ſoil, wet as well as dry. In the formation of extenſive incloſures, it very often happens that a part of the line in which the incloſing fence is to run is wet and ſpouty ; in place of paying attention to that circumſtance, diſcontinuing the wall where the dry land terminates, and either attempting to lay the ſpouty parts dry by draining, or plant a hedge of willows, poplars, or other plants adapted to wet ſoils upon the ſurface, the wall is too frequently continued through the whole. The conſequence (as may very naturally be expected) is, that the wall, for want of a ſolid dry foundation, ſoon tumbles down, or is continually needing repairs. Along with this inattention to the ſhape of walls, conſiderable loſs ariſes from building them with round, or what are termed land-ſtones. Theſe, from their ſhape, are incapable of preſenting a ſufficient extent of ſurface to each other to bind them, or give ſtability to the building, by which means it ſeldom laſts long, though clay, or even lime is made uſe of. The practice of mixing clay is particularly inexpedient, as in general the firſt winter's froſt, or a long continued ſeries of wet weather, ſaturates the clay ſo completely, that the wall ſwells, burſts, and is thrown down. And the practice of incloſing with the different kinds of dead hedges and palings is productive of equal loſs both to individuals and the community. Were theſe fences made to anſwer only a temporary purpoſe, ſuch as protecting a young hedge, &c. &c. the loſs would not be great, as their original value is ſmall, and, long before they were totally decayed, the hedges they were meant to protect would be ſo far advanced, as to make good fences without their aſſiſtance. From the peruſal of the different reports, however, it appears that in many of the Engliſh counties they are reſorted to in caſes where permanent plans of incloſing are intended, and are the only fence made uſe of. The ſurveyors who have noticed the practice are unanimous in their diſapprobation of it, and repreſent the fences as periſhable, and in the higheſt degree expenſive. In ſeveral whole diſtricts, dead hedges of different kinds form the only fence, and occaſion an annual expence upon the property ſo incloſed, amounting from a fifth to a tenth part of the rent. Nearly an equal loſs and expence is incurred in incloſing with paling ; and what adds to the regret that ariſes from the obſervation of this ruinous practice is, the ſoil and climate in moſt caſes where it prevails are well calculated for the growth of live fences. It is evident that what is ſaid above will be conſidered by the public at large as a reproach, and will be felt as ſuch by thoſe concerned. We admit that the feelings of individuals ought, in every inſtance where it is compatible with the public welfare, be reſpected ; but where either their opinions or practices are hurtful to the country, or hoſtile to its improvement, they are juſtly reprehenſible. Forbearance in ſuch caſes is vice ; and though expoſing their faults may, in ſome inſtances, cover them with ſhame, yet the taſk is neceſſary ; and by fixing the attention of the public upon the ſubject, has very often the effect of preventing the moſt ſerious abuſes and bringing about valuable improvements.

Where wet ditches conſtitute the fence, either in their ſimple ſtate, or as making a component part of another fence, ſuch as ditch and hedge, &c. due attention has in very few inſtances been paid to ſecure every advantage that might be derived from their uſe. Proceeding without judgment, the ditches in many counties are made equally deep and wide upon wet and dry lands, from an erroneous opinion, that the drainage of the field, and the future proſperity of the hedge, require a ditch of certain dimenſions. In place of laying off the field in ſuch a ſtyle as to make the ditches ſubſervient to the purpoſes of drainage as well as incloſure, they are frequently dug at random, of an uncommon depth and width, with a high bank or mound of earth on the ſide next the field, ſo ſtrong and thick that no water can find its way through it. In that way the ditch, in place of acting as an open drain for carrying off the water from the adjacent fields, acts as a kind of barrier to prevent it from getting away; while, from the want of a proper level and outlet, when once filled it becomes a kind of reſervoir; and by continuing filled with water three parts of the year, chills the roots of the incloſing hedge plants ſo much, that they either periſh entirely, or remain ſmall, ſtinted, and diſeaſed. In this place it may be neceſſary to obſerve, that the uſe of ditches as open drains has in many inſtances been completely miſunderſtood. In moſt of the old incloſures they were thought valuable only in proportion to the quantity of water they were capable of containing, without conſidering whether they were ſo ſituated as to convey that water to a proper outlet. In the Reports of the counties of Ayr and Stirling, theſe deep and wide ditches are deſcribed, and their defects noticed: in the former county they are from ſix to eight feet wide, and of a proportionable depth; and in the latter, they are in many caſes upwards of twelve feet wide. The quantity of valuable ground occupied in that way, over ſuch extenſive diſtricts, muſt be immenſe; and when to this is added the injury done to the hedges from their roots being chilled, and the inconvenience ariſing from having a tract of country ſo much cut and interſected by theſe canals during winter, which prevents all paſſage through them, and the danger of weak horſes or cattle, or even unfortunate travellers, who miſtake their road in the dark, falling into them (circumſtances which unfortunately too often occur), together with the expence of making ſuch deep excavations, it will readily appear that the practice is bad, and that every purpoſe both of drainage and incloſure might be anſwered, at perhaps a fourth part of the expence, and without any of the riſks or inconveniences we have mentioned. See Fence and Hedge.

It is further remarked, that in many parts the defective method of rearing and managing the hedges is no leſs ſtriking. In place of making the whole hedge of one kind of plants ſuited to the nature of the ſoil, and ſuch as, when arrived at a certain age, are capable of making a good fence, the incloſure is frequently ſurrounded with a motley mixture of ſhrubs, many of which, even in their moſt perfect ſtate, are unfit for making a fence; while others, though they might have anſwered that purpoſe pretty well if the whole fence had been made with them, yet, from the circumſtance of their being mixed with others, which not only come into leaf, but alſo ſhake their leaves at a different ſeaſon, both hurt each other's growth, are offenſive to the eye, and take from the general appearance of the country. Such, however, are the fences in ſome parts of the fineſt counties in England, where, upon the top of a high bank that has been raiſed by robbing the adjoining ground of its ſoil, a motley hedge, conſiſting of various plants, is met with, full of gaps filled up with ſtones or dead wood, forming a very inſufficient fence, either for the purpoſe of confining the ſtock while the field is in paſture, or of protecting the crops while it is under tillage. In other caſes, when the plants of which the hedge conſiſts are of one kind, it too often happens, that they are by no means ſuited to the nature of the ſoil. For example, in incloſing a large field where a part of the line of fence is perfectly dry, and a part of it wet and ſwampy, in place of planting quicks or white-thorns upon the dry ſpaces, and willows, poplars, birches, or ſuch plants as thrive in damp ſituations upon the wet parts, the whole field is often ſurrounded with thorns, greatly to the hurt of the proprietor and occupier; as upon the dry land the thorns thrive, and in a few years make a good fence, while upon the wet parts they either fail entirely or are good for nothing; whereas, with a little judgment in accommodating the plants to the ſoil, planting quicks upon the dry land, and willows, poplars, &c. upon the ſpouty and ſwampy parts, the whole would thrive, and there would be no defect in the line of incloſure. To this miſtake (a want of judgment in accommodating the plants to the ſoil) are to be added the defects which commonly take place in the after-management and training of hedges. It is now well known, that the whole, or the greateſt part of the plants of which hedges are made, if left to themſelves without pruning or weeding, run up to a conſiderable height, grow broad and buſhy at top, and become open and naked at bottom. To prevent this there is no remedy known, but that of cutting over the main ſtems of the plants of which the hedge conſiſts, after they have attained a certain height, and pruning or trimming the lateral branches in ſuch a way as to preſerve the hedge thick and broad at the bottom, and give it a gradual taper towards the top. But in place of this management, the hedge, in moſt inſtances, after being planted, is abandoned to its fate, and neither weeding, pruning, nor indeed any other attention beſtowed upon it: in that way a number of the plants are either choked by weeds, or remain in a dwarf ſtunted ſtate; and ſuch as ſurvive this uſage are allowed to ſhoot up at random, and ſoon attain a great height without being uſeful as a fence, and by the ſpreading of their branches at top, not only become naked and open below, but cover three times the ſpace of ground that hedges differently kept uſually do.

It may be obſerved, in general, in regard to the directions of the incloſing fences, that they ſhould run up the ſides, and immediately acroſs the tops of the elevations, by which their heights are in appearance conſiderably increaſed. But in ſome caſes it may be better to carry them in an oblique manner acroſs, as affording greater advantage in the direction of the ridges and in producing ſhelter and ſhade. They have in common the moſt beneficial effects in the level and valley lands, when they are placed in a parallel direction to the riſing grounds, and when they interſect one another at right angles, and where the incloſures approach nearly to perfect ſquares. See Fence and Hedge.

In addition to the various advantages that have been already mentioned, the incloſing of land enables the farmer to act as is the moſt ſuitable and convenient in reſpect to the cultivation of his different crops, as well as to purſue various other plans of good huſbandry that could not otherwiſe be attempted.

In caſes where farms are to be incloſed, it will be advantageous to begin with having a ſurvey and plan made, that they may thereby be divided and proportioned out with greater propriety and preciſion, ſo as to render them pleaſing to the eye and convenient to the farmer; and if there be places of reſidence upon them, the whole of each may be made to become ornamental to the reſidences, by a judicious diſpoſition of the hedges and plantations. And when there are different farms, they ſhould be ſo divided, that the dwelling of each tenant may be as contiguous to his land as conveniency will admit of, in order to prevent length of carriage, and to facilitate attendance, labour, &c. See *Waſte* Land.

INCOGNITA, in *Natural Hiſtory*, is a term which has frequently been applied to the animal and vegetable remains found imbedded in the ſtrata of the earth, from the circumſtance of their not agreeing, when examined with ſufficient care to minutely diſcriminate, with the known exiſting ſpecies to which they bear a reſemblance in many inſtances: it has been thought by many late naturaliſts, that all the reliquia of the ſtrata are incognita, or belong to extinct and unknown races of organic beings, ſometimes called the primitive creation, and the antediluvians, but not with propriety, becauſe the animals and plants that exiſted before Noah's flood were of the very ſame kind as we now have.

INCOGNITO, a term borrowed from the Italians, uſed when a perſon is in any place where he would not be known; but it is more particularly applied to princes, or great men, who enter towns, or walk the ſtreets, without their ordinary train, or the uſual marks of their diſtinction and quality; or when they travel without their proper titles.

The grandees in Italy make a common cuſtom of walking the ſtreets incognito; and always take it amiſs, on ſuch occaſion, when people pay their compliments to them. It is not barely to prevent their being known that they take theſe meaſures, but becauſe they would not be treated with ceremony, nor receive the honours due to their rank.

When the horſes in princes, cardinals, and ambaſſadors coaches have no taſſels, which they call *fiocchi*, and the curtains, which they call *bandinelle*, are drawn, they are reputed to be incognito; and nobody that meets them is obliged to ſtop, or make his honours to them.

The cardinals alſo, when they would be incognito, leave off the red hat.

INCOMBUSTIBLE, that which cannot be burnt or conſumed.

Metals melt, ſtones calcine, and are yet incombuſtible. Cloth made of lapis amianthus (ſee Amianthus) has been deemed incombuſtible: it is cleaned by fire, but not burnt. See Asbestos, and Linum *Incombuſtibile.*

Incombustible *Lint*, a name given by authors to a peculiar kind of aſbeſtos, or earth flax, which never is formed into compact maſſes as the other ſpecies are, but is always found in looſe filaments, and thoſe of a very flexible nature, and extremely fit to work.

This is a kind of aſbeſtos, wholly different from the ſpecies known to the ancients, and is found, ſo far as is yet known, only in the county of Aberdeen in Scotland, in the neighbourhood of Achintore, near the Highlands. See Asbestos, and Linum *Incombuſtibile.*

The fabricating a cloth of this ſubſtance has not yet been attempted; but Mr. Wilſon, who firſt diſcovered it, had ſome of it ſpun into yarn, which gives proof that the other is practicable. Phil. Tranſ. N° 276. p. 1005.

Incombustibles, *Simple*, in *Chemiſtry*, are thoſe whoſe characteriſtic property is a ſtrong tendency to unite to oxygen: the combination is not accompanied by the emiſſion of heat and light, and the compounds formed are capable of ſupporting combuſtion. (See Supporters.) Only two ſubſtances poſſeſs this character, namely, Azot and Muriatic *Acid*, which ſee.

Incombustible *Wood*, in *Natural Hiſtory*. Dr. Grew, in his Catalogue of the Rarities in Greſham College, p. 269, mentions pieces of wood half petrified, which held in the fire become red like a coal, but do not flame or ſmoak.

INCOMMENSURABLE, a term in *Geometry*, uſed where two lines, when compared to each other, have no common meaſure, how ſmall ſoever, that will exactly meaſure them both.

In the general, two quantities are ſaid to be incommenſurable, when no third quantity can be found that is an aliquot part of both; or, when thoſe quantities are not to one another as unity to a rational number; or as one rational number to another. See Commensurable.

The ſide of a ſquare is incommenſurable to the diagonal, as is demonſtrated by Euclid; but it is commenſurable in power, the ſquare of the diagonal being equal to twice the ſquare of the ſide.

Pappus, lib. iv. prob. 17, ſpeaks alſo of incommenſurable angles. Surfaces which cannot be meaſured by a common ſurface, are alſo ſaid to be incommenſurable in power. See Diophantine *Problems.*

INCOMPATIBLE, that which cannot ſubſiſt with another without deſtroying it.

Thus, cold and heat are incompatible in the ſame ſubject; the ſtrongeſt overcoming and expelling the weakeſt.

Incompatible *Benefices*, in *Law*, are thoſe which cannot be retained together, if they be with cure, and of a particular value in the king's books. See Chaplain.

INCOMPLEX Opposition. See Opposition.

INCOMPOSIT, in *Muſic*, is a term uſed by Euclid to expreſs ſuch intervals in certain Greek ſcales of muſic, as reſulted or were required to make up the whole diateſſaron or minor fourth. In the chromatic molle, the incompoſit interval, which, with two Triental *Dieſes* (ſee that article), is required to complete the tetrachord, being the difference between a fourth and two-thirds of a major tone, is $184\frac{2}{3}\Sigma + 3\frac{2}{3}f + 16\,m$, or $184.61678\,\Sigma + 4f + 16\,m$, its common logarithm is .9091629.4502, and in thoſe of Euler or decimals of the octave .301755, and it contains 16.83717 major commas. According to Holder's treatiſe, 1ſt edit. p. 101, this incompoſit interval was rated by Euclid to contain "a tone and half and a third part of a tone," which is $1\frac{5}{6}$ T, but this is $190.62071\,\Sigma + 4f + 16\,m$, and differs more than half a comma from the above, and is one among the many inſtances in which it will appear, that even this prince of mathematicians had but imperfect ideas of the comparative values of ſurd or fractional muſical intervals, to which the modern invention of logarithms has opened ſo eaſy a road. See Interval.

Incomposit *of the Chromatic Seſcuplum*, in the *Greek Muſic*, is the exceſs of the fourth above one-ſixth part of a major tone, which in Mr. Farey's notation is $219\frac{1}{3}\Sigma + 4\frac{1}{3}f + 19\,m$, or $219.38322\,\Sigma + 4f + 19\,m$, its common logarithm is .8921121.0420, its Euler's log. = .358397, and it contains 19.99746 major commas. Euclid is ſaid to have repreſented this incompoſit interval as being ſeven of his dieſis quadrantalis, or $1\frac{3}{4}$ T, which, however, is $182.072864\,\Sigma + 3f + 16\,m$, and conſequently differs more than three commas from it: another inſtance of what has been obſerved above. See Interval.

Incomposit *of the Diatonic Molle*, is the exceſs of the fourth above $1\frac{3}{4}$ major tone, which is $72\,\Sigma + 1\frac{1}{2}f + 6\frac{1}{4}\,m$, or $71.927136\,\Sigma + 2f + 6\,m$: its common logarithm is .9645781.7767, and its Euler's or binary log. = .117671, and it contains 6.56564 major commas. Euclid ſtates this to be equal to three quadrantal dieſes, but which is $\frac{3}{4}$ T, or 78.072865

$78.072865\,\Sigma + f + 7\,m$, and differs more than half a comma from the above.

Incomposit *Ditone of the Enharmonic Genus*, is the exceſs of a fourth above half a tone major, or $3^2 \div 8\sqrt{2}$, which is $202\,\Sigma + 4f + 17\frac{1}{2}\,m$, or $202.00393\,\Sigma + 4f + 17\,m$, whoſe common logarithm is .9006375.2462, and its Euler's log. = .330076, and it contains 18.41741 major commas.

INCOMPOSITE Numbers are the ſame with what Euclid calls *prime numbers*. See Prime and Number.

INCOMPOSTO, *Ital. uncompounded*, which ſee.

INCONCINNOUS, in *Muſic*. Diſcords are diſtinguiſhed into concinnous and inconcinnous intervals; the concinnous are ſuch as are practicable and fit for muſic, having a good effect when combined with concords according to the rules of harmony. The other diſcords that can have no admiſſion in muſic are called inconcinnous, as being out of proportion, and making no part of the ſcale. (See Discord and Proportion.) Syſtems, in ancient muſic, are alſo divided into concinnous and inconcinnous; a ſyſtem is ſaid to be concinnous, or regularly divided, when the parts conſidered as ſimple intervals are concinnous, that is, when ſingly uſed in melody, or combined in harmony.

Inconcinnous *Intervals*, according to M. Henfling, are ſuch as are a comma flatter or ſharper than perfect; ſuch are alſo called deficient or redundant, or comma-deficient and comma-redundant intervals, and are marked with a grave or an acute accent, as $3^{\backprime}$ or $4'$. Dr. Callcott obſerves, in the Overend MS. vol. vi. p. 92. in the library of the Royal Inſtitution, that of the ſix inconcinnous intervals $3'$, $6'$, $4'$ and $3^{\backprime}$, $6^{\backprime}$, and $5^{\backprime}$, the $3^{\backprime}$, $5^{\backprime}$ and $6'$, $4'$ are uſed in harmony, but the $3'$ and $6^{\backprime}$ only in the melody of modern muſic. Of the inconcinnous ſcale of Ariſtides, an account is given in vol. i. p. 201 of the manuſcripts above quoted.

Inconcinnous *Syſtem*. See System.

INCONSONANCE, in *Muſic*, is of the ſame import nearly with diſſonance, or a jarring and unpleaſant ſound.

INCONTINENCE *of* Urine implies, in *Surgery*, an inability of retaining this fluid in the bladder, ſo that in ſome inſtances the patient's water dribbles away inceſſantly; in others only a frequent diſcharge of it is made; but in all caſes, the evacuation is quite involuntary, and not under the controul of the will.

Sometimes the urine dribbles away continually, while the patient not only has no inclination to void it, but even no ſenſation of its being voided. In other examples, the patient can hold his water in a certain degree; but the propenſity to evacuate it comes on ſo frequently, ſuddenly, and irreſiſtibly, that the bladder immediately empties itſelf, notwithſtanding the dictates of the will, and every effort on the part of the patient to the contrary. Another kind of incontinence of urine only happens in the night-time, when the patient is aſleep.

Women are more ſubject than men to an incontinence of urine; but, on the other hand, they are leſs frequently troubled with retentions. The reaſon of this circumſtance admits of ſatisfactory explanation, by adverting to the large ſize and ſhortneſs of the female urethra, and to the general cauſes depriving patients of the power of containing their urine.

1. We ſhall firſt ſpeak of the incontinence of urine attended with a weakneſs or paralytic affection of the ſphincter veſicæ muſcle. As, in this caſe, the neck of the bladder is, as it were, conſtantly open, the urine eſcapes through the urethra immediately after it has deſcended from the ureters. Sometimes the weakneſs, or paralyſis of the ſphincter is entirely a local defect; on other occaſions, it is merely a ſymptom of another general diſorder. In the firſt of theſe examples, the affection of the ſphincter is frequently the conſequence of a difficult labour, in which the neck of the bladder has ſuſtained injury from the long and great preſſure made upon it. A paralyſis of the ſphincter may alſo be an effect of the laceration and violent diſtention of the neck of the bladder, in extracting a ſtone from this organ in the operation of lithotomy. Here it is proper to remark, that the evil may generally be imputed to the miſconduct of the ſurgeon, who, after neglecting to make a ſufficient diviſion of the parts with his cutting inſtruments, drags out the ſtone through the inadequate opening *totis viribus*. Indeed, we have ſeen ſome old greyheaded operators whoſe fair exertion of ſtrength has been unequal to draw out the ſtone, and who have only ſucceeded by dint of their weight, in other words, by leaning backwards and hanging on the forceps. Every deliberate ſurgeon who knows how often lithotomy proves fatal from manual roughneſs and violence, muſt acknowledge that ſuch operators almoſt deſerve another kind of hanging, and that the tumble backwards to which they are commonly expoſed, would hardly be a ſufficient puniſhment for their awkwardneſs and ignorant barbarity. It is not only the duty of the ſurgeon to make an ample and direct opening into the bladder, he ought to draw out the ſtone in a ſlow and gentle manner, ſo as to afford an opportunity for the parts to yield as much as poſſible.

Much danger, and ſerious injury of the neck of the bladder, are likewiſe frequently aſcribable to the ſtone being forcibly extracted with its long axis acroſs the wound. So zealous and eager are many operators, that when once they get hold of the calculus, they never let it go again, whatever may be the poſition in which it is graſped. Fearful of loſing time, or perhaps of never being able to ſeize the foreign body again, they keep faſt hold, and are only able to effect the extraction by the moſt awkward and unwarrantable violence. (See Lithotomy.) The preſent kind of incontinence of urine is often a conſequence of the debility incident to old age. Sometimes the diſorder proceeds from the deſtruction of the ſphincter muſcle by ulceration. Inſtances occaſionally preſent themſelves where an analogous incontinence of urine happens from congenital malformation, the fluid eſcaping through a preternatural opening, which is unprovided with any ſphincter. The complaint may be attendant as a ſymptom upon all other diſeaſes, which are accompanied by loſs of ſenſation, lethargic complaints, delirium, or extreme debility; it is frequently induced by apoplexy, and injuries and diſeaſes of the vertebræ and ſacrum.

Although the infirmity is not in itſelf attended with danger, it occaſions conſiderable inconvenience. The conſtant dribbling of the urine keeps the patient's clothes continually wet, produces a very unpleaſant ſmell, and gives riſe to inflammation, excoriation, and ulceration of the adjacent parts.

It deſerves remembrance, that in women, and perſons of advanced age, a miſtake may eaſily be made concerning the real nature of the caſe. What is frequently ſuppoſed to be in elderly people an incontinence of urine, is, in fact, often quite the contrary, namely, a retention of urine, accompanied by a paralyſis of the bladder. When this receptacle is full, ſome urine always makes its eſcape againſt the will of the patient, and at length ſuch involuntary diſcharge becomes inceſſant, in conſequence of the bladder remaining continually full. With regard to females, who, after difficult labours, are afflicted with an inability of retaining their water, practitioners generally conclude without heſitation, that the infirmity is dependant upon a paralyſis of the ſphincter muſcle, while it not unfrequently proceeds from a fiſtulous opening, formed between the bladder and vagina, in conſequence of a ſlough, or ulceration.

In caſes where the weakneſs or paralyſis of the ſphincter veſicæ is altogether a local affection, the internal and external employment of tonics and ſtimulants is indicated. The following plans and remedies are ſaid to have been uſed with ſucceſs:—bathing the feet and parts about the pubes with cold water; introducing cold injections into the bladder; laying in the vagina a ſponge, which has been filled with cold water; pumping cold ſpring water upon the pubes and perineum; giving, every four hours, half a drachm of alum with ten grains of gum arabic; uſing as a lotion, which is to be applied externally, or within the vagina by means of a ſponge, a liquor compoſed of wine, brandy, and a decoction of aſtringent herbs; exhibiting bark internally; applying a bliſter upon the ſacrum, or perineum, repeatedly; giving from fifteen to thirty drops of the tincture of cantharides with ſome lac amygdalæ; placing the parts about the pubes in a ſhower bath; electricity; frequently rubbing the ſpine and ſacrum with a ſtimulating liniment, compoſed of cocoa, butter, and the oils of lavender and nutmegs, or elſe of hartſhorn and ſpiritus ſerpilli; adminiſtering chalybeates, &c.

Whenever the weakneſs or paralyſis of the ſphincter veſicæ occurs, merely as a ſymptom of another diſeaſe, the firſt indication is to endeavour to remove this laſt affection; and then if the paralyſis of the ſphincter ſhould continue, the ſurgeon is to try ſome of the preceding tonic and ſtimulating remedies.

The long enumeration which we have given of methods which have been practiſed with ſucceſs, may be likely to create indeciſion, with reſpect to ſuch plans as claim the preference. We have no heſitation, then, in declaring our belief, that the records of ſurgery, and the leſſons of daily experience, are moſt ſtrongly in favour of applying bliſters to the ſacrum, and bathing the region of the pubes, and the perineum with cold ſpring water. The efficacy of bliſters, in this ſpecies of the diſorder, is ſurpriſingly diſplayed in a ſeries of ſucceſsful caſes, related in the Medical Obſervations and Inquiries. We have alſo a high opinion of the internal employment of the tincture of cantharides, with bark and ſteel medicines, eſpecially when aided by electricity, or frictions of the ſpine and ſacrum with a ſtimulating liniment.

When the diſorder proves incurable, the ſurgeon always has it in his power to recommend ſome apparatus for leſſening the inconveniences with which the patient is annoyed. A thing which anſwers the purpoſe in male ſubjects, is a ſort of flaſk or bottle, which is to be placed in ſuch a manner that the urine may run into it, by which means all bad ſmell, uncleanlineſs, and wetneſs will be avoided. The flaſk muſt alſo be ſo put on as not to be irkſome to the patient when he moves about. That which is deſcribed in Juville's Traité des Bandages, conſiſts of three pieces; namely, an ivory mouth, an elaſtic gum-neck, and a ſilver body. The veſſel is faſtened by means of tape to a leathern girt, which goes round the waiſt. The ivory mouth is round, and about eighteen lines in diameter. Its external margin is furniſhed with ſeveral ſmall apertures, through which the tapes are intended to paſs. Its inner ſurface is ſlightly excavated, ſo that it fits more exactly on the parts about the pubes. Its external ſurface is a little convex, and provided with a projecting arm, which is here and there perforated, and is deſigned for having the elaſtic gum-neck attached to it.

The neck of the apparatus muſt be made of a ſingle piece of elaſtic gum, without any ſeam, about four or five inches long, and of ſufficient breadth to contain the penis. The lower end of this tube is ſcrewed to the ſilver body of the inſtrument. At the top of the ſcrew part of the body are three pins, which internally croſs each other, in the form of a ſtar, and are intended to ſupport a bit of ſponge that is put within the neck. In the ſilver receptacle is a funnel, the lower end of which is furniſhed with a valve. The ſilver part of the inſtrument is flat, four inches broad, and when the apparatus is put on, always lies at the inſide of the thigh, in a ſmall pocket made in the patient's breeches for its reception. The ſponge, in the elaſtic tube, and the valvular funnel, in the ſilver receptacle, effectually prevent any return and eſcape of the urine, which would otherwiſe happen when the patient raiſes his thigh, or ſits down. When the body of the inſtrument is full, it is to be ſcrewed off, and emptied; nor is there the leaſt occaſion to take off the whole of the apparatus. On certain occaſions the patient, if he chooſes, can ſcrew on a receptacle of larger ſize.

It has been objected to inſtruments of the preceding deſcription, that they cannot be conſtantly retained upon the part, taken off and on, and carried about by the patient, without great trouble and inconvenience. Hence ſome ſurgeons have given the preference to an inſtrument, whereby the penis and urethra may be gently compreſſed, ſo as to retain the urine in the bladder, and diſcharge it, by day or night, at pleaſure, (as is aſſerted,) with little more trouble than in the ordinary way, by opening and ſhutting the little, light, and eaſy inſtrument called a yoke. Nuck was the inventor of a famous contrivance of this kind, which is repreſented in the plates of Heiſter's ſyſtem of ſurgery, together with another yoke, deviſed by the latter practitioner himſelf. See *Tab.* 26. *figs.* 8, and 9.

It is juſtly remarked by modern writers, that the jugum penis hardly admits of being worn when there is a tendency to erections; and, in other caſes, the machine is always apt either to make too little preſſure, ſo as not to reſtrain the urine, or elſe too much, ſo as to produce pain.

To female patients, the foregoing contrivances are, of courſe, totally unadapted, and, in this ſex, it is ſomewhat difficult to obviate and diminiſh the inconveniences ariſing from an incontinence of urine. Sponge, which has commonly been introduced within the vulva, is of little uſe; for it muſt be taken out, and replaced again, exceedingly often, or elſe, in conſequence of its becoming quickly full of urine, this fluid runs down as faſt as if no means at all were taken to hinder ſuch annoyance. Beſides, when the patient ſits down, the urine is partly preſſed out of the ſponge, and, making its eſcape, wets the clothes, and cauſes much uncleanlineſs. This circumſtance led to the idea of compreſſing the female urethra againſt the os pubis, ſo as to cloſe the paſſage, and ſeveral inſtruments for this purpoſe have been invented and recommended. One of the ſimpleſt inſtruments of this ſort is a peſſary, which is made very convex on the ſide towards the os pubis, ſo as to compreſs the meatus urinarius againſt this bone; and, in order that the preſſure may neither be too powerful nor too feeble, we are particularly adviſed to employ peſſaries made of elaſtic gum.

Deſault aſſures us, that the objects in view are beſt fulfilled by an inſtrument, which has a ſteel ſpring, reſembling that of a common truſs, and extending round the pelvis. In the middle of the ſpring, preciſely over the ſymphyſis pubis, is a metallic plate, from which proceeds downwards a long, narrow, ſomewhat curved piece of ſteel, on the lower end of which is fixed a pad, deſigned for preſſing the meatus urinarius againſt the os pubis. In order that the degree of preſſure may be more nicely regulated, the long ſteel branch may be conſtructed with a hinge, or joint, at its middle. The upper part of this piece of ſteel ought to project a little beyond the lower portion, ſo as to allow a ſcrew to be placed in it, whereby the lower bit of ſteel, and the pad belonging to it, may be preſſed, in the requiſite manner, towards the os pubis. (See Journal de Médécine, tom. iii.) A ſimilar, but apparently a ſtill more commodious inſtrument of this kind, is deſcribed by Le Rouge in the Journal de Médécine, Chirurgie, et Pharmacie, tom. lxxvii. p. 459.

Experience alone can determine whether ſuch inventions will anſwer the intended purpoſe. Richter apprehends, that the conſtant preſſure muſt, at length, prove painful, and that, if it were not ſtrong, it could not hinder the urine from eſcaping. Reaſons of this ſort have induced ſome writers to recommend the employment of a flaſk, or receptacle for the urine, as well for female as male patients. An apparatus has been invented, conſiſting of a bandage, that paſſes round the body, and is provided with an elaſtic piece of ſteel which deſcends over the mons veneris, and preſſes an oblong tin funnel againſt the orifice of the meatus urinarius. A bit of ſponge is placed within the funnel, and projects a little over its edge, being calculated to lie upon the opening of the urethra, imbibe the urine, and conduct it into the funnel, from which it drops into a bladder, or ſkin pouch, purpoſely placed for its reception. (Botticher, vom Chirurgiſchen Verbande.) As the preceding apparatus muſt, in all probability, put the patient to inconvenience when ſhe ſits down, Richter ſuſpects, that it might be beſt to introduce into the urethra a flexible catheter, the lower end of which is to be faſtened to Juville's flaſk, after being properly fixed in the manner deſcribed in ſpeaking of the latter apparatus. The receptacle can eaſily be retained on the inſide of the thigh.

Having treated of the incontinence of urine, attended with a paralyſis of the ſphincter veſicæ, we ſhall next ſpeak of that ſpecies of the diſorder which has been called *ſpaſmodic*, and uſually ariſes from the operation of ſome irritation or another upon the bladder. In a caſe of this nature, it is always a chief indication to diſcover and remove, if poſſible, the active irritation, which, according to ſurgical authors, may be of ſeveral kinds: worms, hemorrhoids, cold, ſuppreſſion of the menſes, a calculus in the bladder, an abſceſs near the anus, &c. The treatment muſt, of courſe, be ſubject to conſiderable variety. When the particular nature of the irritation cannot be detected, the practitioner muſt employ general anodyne and antiſpaſmodic remedies, opium, the warm bath, &c. In theſe caſes, the uva urſi has been preſcribed with infinite advantage. The preſent ſort of incontinence of urine occaſionally occurs merely as a ſymptom of epilepſy, hyſteria, &c. In this circumſtance, the treatment is to be entirely directed againſt the original diſeaſe. The diſorder is frequently produced by preſſure on the bladder, and therefore we ſee it brought on by polypi of the uterus, pregnancy, or a deſcent of the womb.

The third ſpecies of incontinence of urine, or that to which patients are only ſubject in the night-time, cannot always be regarded as a diſeaſe. In young ſubjects, the caſe is uſually one of the three following kinds: the boy either neglects to get up, when he feels an inclination to make water; or he ſleeps ſo ſoundly, that he is utterly inſenſible of the calls of nature; or laſtly, he dreams that he is making uſe of a chamber-pot, and empties his bladder, as it were, voluntarily. The firſt of theſe caſes requires proper advice, and, if that will not do, moderate chaſtiſement. The ſecond, it would certainly be the height of abſurdity and cruelty to endeavour to obviate by corporal puniſhment; it is a true infirmity, incidental to childhood, and commonly diſappearing as the boy grows a little older. The application of puniſhment to the third inſtance is likewiſe quite irrational and improper. Children liable to the nocturnal incontinence of urine, ought rather to be kept from drinking too late in the evening, and care ſhould always be taken to make them uſe the chamber-pot before they are put into bed. The children alſo, if poſſible, ſhould be waked in the courſe of the night, in order that they may make water.

When adults are troubled with the infirmity, or children continue afflicted, notwithſtanding the trial of ordinary plans, a quarter of a grain of the pulv. cantharid. may be adminiſtered, every evening, in ſome milk of almonds. When this plan fails, we have reaſon to ſuſpect, that the incontinence of urine is owing to the operation of a preternatural irritation on the bladder. In this circumſtance, if relief is to be derived from medicines, it muſt be from ſuch as opium and ipecacuanha.

In obſtinate caſes, it has been ſuggeſted, that benefit might be derived from adviſing the patient to retain his urine a good deal in the day-time, by which means the bladder, being accuſtomed to hold a conſiderable quantity of fluid, would not be ſo prone to contract in the night-time for the expulſion of a ſmall quantity.

Should all the above methods prove ineffectual, the only reſource left is to put on the patient, juſt before bed-time, one of the machines already deſcribed in a previous part of the preſent article.

In the particular caſe, where a fiſtulous communication exiſts between the bladder and vagina, in conſequence of ulceration, or ſloughing, if the aperture will not heal by making the patient lie a good deal on the abdomen, we may ſcarify the ſides of the opening, and endeavour to make them unite with a ſuture. Perhaps, in ſome inſtances, the opening might be healed by touching it with cauſtic, making the patient lie upon her abdomen, and keeping a catheter, as much as poſſible, in the urethra.

INCONTINENCY, in a moral ſenſe, is of divers kinds; as in caſes of bigamy, rapes, ſodomy, or buggery, getting baſtards; all which are puniſhed by ſtatute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of prieſts is puniſhable by the ordinary, by impriſonment, &c. 1 Hen. VII. cap. 4.

INCORPORATION, formed from *in*, and *corpus*, *body*, the mixing the particles of different bodies ſo together, as to make an uniform ſubſtance or compoſition of the whole, without leaving any poſſibility of diſcerning the ingredients or bodies mixed, in any of their particular qualities.

INCORPORATION, in *Law*. See CORPORATION.

INCORPOREAL, SPIRITUAL; a thing, or ſubſtance, which has no body. See SPIRIT and BODY.

Thus the ſoul of man is incorporeal, and may ſubſiſt independently of the body. See SOUL.

Thoſe ideas which are independent of bodies, can neither be corporeal themſelves, nor be received within a corporeal ſubject: they diſcover to us the nature of the ſoul, which receives within itſelf what is incorporeal, and receives it in a corporeal manner too; whence it is, that we have incorporeal ideas even of bodies themſelves. Fenelon.

INCORPOREAL *Inheritance*, in *Law*. See INHERITANCE.

INCORRUPTIBLE, that which cannot be corrupted. See CORRUPTION.

Thus ſpiritual ſubſtances, as angels, human ſouls, &c. and thus alſo glaſs, gold, mercury, &c. may be called incorruptible.

INCORRUPTIBLES, INCORRUPTIBILES, the name of a ſect which ſprang out of the Eutychians.

Their diſtinguiſhing tenet was that the body of Jeſus Chriſt was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not ſuſceptible of any change or alteration; not even of any natural and innocent paſſions, as of hunger, thirſt, &c. ſo that he eat without any occaſion, before his death, as well as after his reſurrection. And hence it was that they took their name.

INCRASSANTS, or INCRASSATING MEDICINES, in the language of the old writers, and of the humoral pathology, ſuch medicines as were imagined to condenſe or thicken the blood and humours, which were of a morbidly thin or fluid conſiſtence. Both the diſeaſed condition, and the operation of medicines upon the fluids, were probably equally gratuitous. See HUMORAL *Pathology*.

INCREASING FAULT, in *Mining*, is applied by Mr. Farey in his Report on Derbyſhire, vol. i. p. 122, to deſcribe thoſe diſlocations of the ſtrata, which are not alike in all parts of the ſame fault, but increaſe in proceeding one way along the fault, and decreaſe, or derange the meaſures, a leſs number of fathoms, yards, feet, &c. in proceeding in a contrary direction: the phenomena attending this important claſs of faults, are deſcribed in the volume above quoted, and their application to mineral ſurveying is ſhewn.

INCREMENT, INCREMENTUM, in *Rhetoric*, a ſpecies of climax, gradually riſing from the loweſt to the higheſt. Such as that of Seneca: "Turpiſſima tamen eſt jactura, quæ per negligentiam venit: et, ſi volueris attendere, magna vitæ pars elabitur male agentibus, maxima nihil agentibus, tota aliud agentibus." See CLIMAX.
